WAR DEPARTMENT,

SURGEON GENERAL'S OFFICE,

WASHINGTON, D. C., *January* 2, 1883.

Brigadier General CHARLES H. CRANE,

Surgeon General, U. S. Army.

SIR:

With the present volume, which I have the honor to submit to you, the surgical series of the Medical and Surgical History of the War of the Rebellion is complete.

The treatment of regional injuries of gunshot origin is continued, and those of the Lower Extremities are taken up and thoroughly discussed in Chapter X. Miscellaneous Injuries not strictly gunshot in character, but incident to the military status, form the subject of Chapter XI. Chapter XII, on Wounds and Complications, includes facts of general interest and of statistical value relative to wounds; to the nature, peculiarities, and effects of missiles and projectiles; to conditions affecting the course and results of wounds, with especial reference to the graver complications of secondary hæmorrhage, erysipelas, pyæmia, gangrene, and tetanus; and, finally, a condensed summary of operations and treatment. Anæsthetics, with reference to their use in the Army, are treated of in Chapter XIII. A brief historical sketch of the Medical Staff, and a description of the Materia Chirurgica will be found in Chapter XIV. The methods of field, railway, and water transportation of the wounded are detailed in the concluding Chapter (XV).

It was attempted, from the inception of the work, to give, in the beginning of each chapter, the number of cases to be treated therein. But, as the work progressed, new cases had to be added, duplicates had to be eliminated, or additional information changed the nature of a case, so as to transfer it to a group different from the one to which it had been originally assigned. Thus the total number of cases given in the beginning of a chapter was frequently found to be incorrect at its close, and as the preceding pages had been stereotyped, it was not practicable to make the necessary corrections. The percentages and general deductions, however, were not materially affected by these discrepancies, which have been corrected in the summary of cases given in Chapter XII, in this volume.

In undertaking the completion of this work, interrupted by the untimely death of its distinguished author, it may be proper to say that no change in, or deviation from, the

original plan has been attempted; that, so far as known, his wishes and intentions with regard to the arrangement and development of the History have been scrupulously regarded.

The work was entered upon, not without serious misgivings as to the wisdom of the choice of successor, and with a full appreciation of the delicate nature of the task and the difficulties involved in its satisfactory solution; its prosecution has been a source of pleasure, while the labor has been materially lessened by the valuable assistance afforded by Mr. C. J. MYERS, who has been associated with the work as colaborer since its inception, and to whose faithful and assiduous care the reliability and accuracy of the History is largely due. The completed volume now awaits your approval and the judgment of the profession. It is hoped that its short-comings may not seriously impair or detract from the beauty and harmony of the masterpiece, which must remain a living monument to the intelligent industry, perseverance, and professional learning of the late Surgeon GEORGE A. OTIS.

I am, sir,

Very respectfully,

Your obedient servant,

D. L. HUNTINGTON,

Surgeon, U. S. Army.

TABLE OF CONTENTS

OF

PART III OF VOLUME II

OF THE

MEDICAL AND SURGICAL HISTORY OF THE REBELLION,

BEING THE

THIRD SURGICAL VOLUME.

CHAPTER X. WOUNDS AND INJURIES OF THE LOWER EXTREMITIES.

Page.

INTRODUCTION 1

TABLE I. Collated returns, indicating the relative frequency of shot wounds of the lower extremity in aggregates of wounded men who came under treatment 2

TABLE II. Partial numerical statement of shot wounds of the lower extremities in the field or primary hospitals in various campaigns during the last year of the war, 1864–'65 3

SECTION I. Flesh Wounds of the Lower Extremities ... 5

Punctured and Incised wounds 5

Bayonet wounds 5

Abstracts of four cases 6

Sabre wounds 7

Other Punctured and Incised wounds 7

Ligations 7

Abstracts of three cases 7

Amputations 8

Abstracts of four cases 8

Shot Flesh wounds 8

Flesh wounds of the Lower Limbs with injury of the Nerves 9

Abstracts of seven cases 10

Flesh wounds of the Lower Limbs with injury of the Larger Blood-vessels 13

Wounds of Blood-vessels treated without operation 13

Abstracts of six cases 13

Wounds of Blood-vessels treated by ligation 16

Abstract of one case 16

Wounds of Blood-vessels treated by amputation 17

Abstracts of two cases 17

PLATE XXVIII. Gangrene following a shot laceration of the Femoral Artery, facing 18

Wounds of Blood-vessels treated by ligation and subsequent amputation 18

Abstract of one case 18

Flesh wounds of the Lower Limbs unattended by Primary injury of the Large Nerves and Blood-vessels 18

Shot Lacerations 19

Abstracts of five cases 19

Lodgement of Missiles 21

Abstracts of six cases 21

Peri-articular wounds, Hip, Knee, and Ankle 24

Abstracts of twenty-nine cases 25

PLATE LVI. Dry Traumatic Arthritis of the Right Hip, facing 27

Page.

SECTION I. SHOT FLESH WOUNDS—[Continued.

Complications of Shot Flesh wounds of the Lower Extremities 32

Pyæmia 32

Abstracts of three cases 32

Hospital Gangrene 33

Abstracts of three cases 33

Tetanus 35

Abstracts of three cases 36

Erysipelas 37

Abstracts of two cases 37

Hæmorrhage 37

Abstracts of two cases 38

Ligations of Blood-vessels of the Lower Limbs after Flesh wounds 38

Ligations of the Common Iliac Artery 39

Abstract of one case 39

Ligations of the External Iliac Artery 39

Abstracts of eleven cases 39

Ligations of the Femoral Artery 43

Abstracts of seven cases 43

TABLE III. Summary of one hundred and twenty-seven cases of ligations of the Femoral Artery 47

Ligations of the Profunda Artery 49

Abstracts of six cases 49

Ligations of large branches of the Profunda Artery 50

Abstracts of three cases 50

Ligations of the Popliteal Artery 50

TABLE IV. Summary of seventeen cases of ligations of the Popliteal Artery 50

Abstract of one case 51

Ligations of the Posterior Tibial Artery 51

TABLE V. Summary of seventeen cases of ligations of the Posterior Tibial Artery 51

Ligations of the Anterior Tibial Artery 51

Abstracts of ten cases 51

Ligations of the Anterior and Posterior Tibial Arteries 52

Abstracts of two cases 52

Ligations of Veins 52

Abstract of one case 52

Amputations in the Lower Limbs after Shot Flesh wounds 53

Amputations in the Thigh 53

Abstracts of two cases 53

CHAPTER X. WOUNDS AND INJURIES OF THE LOWER EXTREMITIES—CONTINUED.

SECTION I.—FLESH WOUNDS, ETC.—[Continued.
PLATE XXVII. Effects of Hospital Grangrene, facing 53
TABLE VI. Summary of one hundred and thirty-one amputations in the Thigh 54
Amputations at the Knee 56
TABLE VII. Summary of six cases of amputations at the Knee 56
Amputations in the Leg 57
Abstracts of two cases 57
TABLE VIII. Summary of sixty-three amputations in the Leg 57
Amputations of the Toes 59
Abstract of one case 59
Tenotomy 59
Abstracts of three cases 59
SECTION II. Wounds and Injuries of the Hip Joint 61
Shot fractures at the Hip Joint 61
TABLE IX. Tabular statement of three hundred and eighty-six shot fractures of the Hip Joint 65
Shot fractures at the Hip treated by conservation 66
Recoveries 67
Abstracts of twenty-one cases 67
PLATE LVII. Gunshot fracture of the Right Acetabulum and the Head of the Femur, facing 68
PLATE XXXIII. Consolidated gunshot fracture of the Femur, facing 74
Fatal cases 77
Abstracts of fifty-two cases 77
Excision at the Hip Joint after shot injury 89
TABLE X. Numerical statement of sixty-six cases of excision at the Hip Joint for shot injury 89
Primary excisions at the Hip Joint 92
Abstracts of thirty-three cases 92
TABLE XI. Summary of thirty-three cases. 99
Intermediary excisions at the Hip Joint 101
Abstracts of twenty-two cases 101
TABLE XII. Summary of twenty-two cases. 111
Secondary excisions at the Hip Joint 113
Abstracts of eleven cases 113
TABLE XIII. Summary of eleven cases 119
Excisions at the Hip Joint for shot injury in the United States service since the war 120
Abstracts of six cases 120
Amputations at the Hip Joint 127
TABLE XIV. Numerical statement of sixty-six cases of amputation at the Hip Joint 127
Primary amputations at the Hip Joint 131
Abstracts of twenty-five cases 131
TABLE XV. Summary of twenty-five cases 138
Intermediary amputations at the Hip Joint 139
Abstracts of twenty-three cases 139
TABLE XVI. Summary of twenty-three cases 144
Secondary amputations at the Hip Joint 145
Abstracts of nine cases 145
TABLE XVII. Summary of nine cases 151
Re-amputations at the Hip Joint 152
Abstracts of nine cases 152
TABLE XVIII. Summary of nine cases 159
SECTION III. Injuries in the Shaft of the Femur 169
Shot contusions of the Shaft of the Femur 169
TABLE XIX. Numerical statement of one hundred and sixty-two cases of shot contusions of the Shaft of the Femur 170
Abstracts of four cases 170
Ligations after shot contusions of the Femur 172
Abstracts of eight cases 172
Amputations consequent on shot contusions of the Femur 172
Abstracts of nine cases 173
Shot fractures of the Shaft of the Femur 174
TABLE XX. Numerical statement of sixty-five hundred and seventy-six shot fractures of the Shaft of the Femur 175

Page.

SECTION III.—INJURIES OF FEMUR—[Continued.
Partial shot fractures of the Shaft of the Femur 175
Abstracts of two cases 176
Shot fractures of the Shaft of the Femur treated by conservation 176
Shot fractures of the upper third of the Shaft of the Femur 177
Recoveries (abstracts of thirteen cases) 178
PLATE LIX. Consolidated gunshot fractures of the Femur, facing 178
PLATE LVIII. Consolidated gunshot fractures of the Femur, facing 180
PLATE LV. Two views of a united shot fracture of the Right Femur over eleven years after injury, facing 182
Fatal cases (abstracts of seven cases) 184
PLATE XXV. Secondary inflammation of the Knee Joint, facing 184
Shot fractures of the middle third of the Femur treated by conservation 187
Recoveries (abstracts of eleven cases) 187
PLATE LX. Consolidated gunshot fractures of the Femur, facing 188
PLATE LXI. Consolidated gunshot fractures of the Femur, facing 190
Fatal cases (abstracts of five cases) 191
PLATE LXII. Consolidated gunshot fractures of the Femur, facing 192
PLATE XXIV. Osteomyelitis in a fractured Femur, facing 194
Shot fractures of the lower third of the Femur treated by conservation 194
Recoveries (abstracts of eight cases) 194
PLATE LXIII. Consolidated gunshot fractures of the Femur, facing 196
Fatal cases (abstracts of three cases) 197
PLATE LXIV. Consolidated gunshot fractures of the Femur, facing 198
Shot fractures of the Femur, without indication of the seat of injury, treated by conservation 198
Pseudarthrosis after shot fractures of the Femur 198
Abstracts of two cases 198
Excisions in the continuity of the Femur for shot injury 199
TABLE XXI. Numerical statement of one hundred and seventy-five excisions in the Shaft of the Femur for shot injury 200
Primary excisions in the Shaft of the Femur. 200
Recoveries (abstracts of four cases) 200
TABLE XXII. Summary of twenty cases of recovery 203
PLATE XXX. Obstructed femoral vein, facing 204
Fatal cases (abstracts of five cases) 204
TABLE XXIII. Summary of sixty-five fatal cases 206
Undetermined cases 207
TABLE XXIV. Summary of six cases with unknown results 207
Intermediary excisions in the Shaft of the Femur 207
Recoveries (abstracts of two cases) 207
TABLE XXV. Summary of nine cases of recovery 208
Fatal cases (abstracts of three cases) 209
TABLE XXVI. Summary of thirty-nine fatal cases 210
Secondary excisions in the Shaft of the Femur 210
Recoveries (abstracts of two cases) 210
Fatal cases (abstract of one case) 211
TABLE XXVII. Summary of nineteen cases 212
Excisions in the Shaft of the Femur at an unknown period 212
TABLE XXVIII. Summary of seventeen cases 212
Amputations in the Shaft of the Femur 213
TABLE XXIX. Numerical statement of sixty-two hundred and twenty-nine amputations of the Thigh for shot injury 213

CHAPTER X. WOUNDS AND INJURIES OF THE LOWER EXTREMITIES—CONTINUED.

BEING THE THIRD SURGICAL VOLUME.

ON SPECIAL WOUNDS AND INJURIES—CONTINUED.

LIBRARY OF THE UNIVERSITY CALIFORNIA

CHAPTER X.

WOUNDS AND INJURIES OF THE LOWER EXTREMITIES.

In attempting to furnish a description, as adequate as practicable, of the various classes of injuries inflicted by war-weapons that were reported during the late war in this country, I have reviewed and analyzed at great length, in two preceding volumes, histories of cases of wounds of the head, neck, trunk, and upper extremities. It remains, to complete this branch of the subject, to discuss, in like manner, Wounds of the Lower Extremities, a very important group, comprising not only a larger number of those cases that come under the treatment of the military surgeon than any other group, but a greater proportion of cases demanding operative interference than is observed in other regions, and presenting to the field surgeon, especially in connection with lesions of the hip and thigh, some of the most difficult practical problems he has to encounter.

Of the 253,142 cases of wounds returned during the War that have been examined and classified and entered on the permanent registers of the Surgeon-General's Office, 89,528 are cases of Wounds of the Lower Extremities. Of these, 59,376 are entered as Flesh Wounds, of which 674 were punctured or incised wounds, and the rest shot wounds. The remaining 30,152 cases were all returned as shot fractures, and were distributed as

follows: Shot Fractures of the Femur, including fractures penetrating the hip joint, 7,776; Fractures involving the Knee Joint, 3,557; Fractures of the Shafts of the Tibia or Fibula, or of both, 10,026; Fractures implicating the Tarsus, Metatarsus, and Phalanges, 8,793. It must be borne in mind that this total of 89,528 cases of wounds of the lower extremities represents only those cases that have been accurately determined and entered on the registers, and by no means all the cases belonging to this group that were reported during the War, and hence as the work progresses the figures will need to be modified. Besides the 253,142 registered cases, quite a number, reported with insufficient details for classification, have been noted for investigation; and, by searching the Pension Records, and through Union and Confederate reports which continue to be sent in, even at this late date, and by special reports from surgeons who kept note-books, and who, since the publication of the *First Surgical Volume*, have been led to transmit particulars of their cases, it will be possible, as each successive subject is taken up for analysis, to sensibly augment the aggregates of each group. This was observed in the discussion of the Wounds of the Upper Extremities. In TABLE XII, on page 454 of the *Second Surgical Volume*, but 84,718 cases of such wounds are recorded as registered, but in examining CHAPTER IX it will be found, as mentioned in the MEMORANDUM at page III of that Volume, that 88,741 cases are actually specified, the particulars of 4,023 additional cases having been obtained through information derived from various sources. Such additions may be expected in this Volume also; but they will not invalidate the approximate correctness of the figures above given, so far as relates to the relative frequency of wounds of the lower extremities. For such a purpose, the numbers 89,528 : 253,142 are ample, and the ratio is perhaps quite as reliable as it could be made by larger aggregates.

The relative frequency of wounds of the lower extremities received in battle, compared with the total number that came under treatment, appears from the above returns to be represented by a ratio of 35.3 per cent., or a little over one-third. There is good reason to believe that this is a very near approximation to the precise facts. Note, for example, its correspondence with returns from other campaigns:

TABLE I.

Collated Returns, indicating the Relative Frequency of Shot Wounds of the Lower Extremity in Aggregates of Wounded Men who came under Treatment.

WARS, CAMPAIGNS, AND OTHER OCCASIONS.	AGGREGATE WOUNDED.	WOUNDS OF LOWER EXTREMITY.	RATIO.
July, 1830, days in Paris and Lyons (SERRIER'S table[1])	784	185	23.5
Crimean War (MATTHEW'S return[2])	7,660	2,396	31.2
Crimean War (CHENU'S return[3])	34,306	11,873	34.6
Italian War of 1859 (CHENU'S return[4])	19,672	7,704	39.1
Italian War of 1859 (DEMME'S estimates[5])	17,095	5,248	30.6
Danish War of 1864 (HEINE[6])	1,907	553	28.9
Franco-German War (Consolidated returns[7])	24,788	7,560	30.5
Totals	106,212	35,519	33.4

[1] SERRIER (L.), *Traité des plaies d'armes à feu*, Paris, 1844, p. 30. The insurgents fighting behind barricades, the proportion of injuries of the lower extremities is less than usual. [2] MATTHEW (T. P.), *Med. and Surg. Hist. of the Brit. Army in the years* 1854–55–56, London, 1858, Vol. II, p. 355. [3] CHENU (J. C.), *Rapport, etc., de Campagne d'Orient en* 1854–55–56, Paris, 1865, p. 627. [4] CHENU (J. C.), *Statistique Med. Chir. de la Campagne d'Italie en* 1859 *et* 1860, Vol. II, p. 850. [5] DEMME (H.), *Studien*, Würzburg, 1861, B. I, p. 20. [6] HEINE (C.), *Die Schussverletzungen der Unteren Extremitäten*, Berlin, 1866. I much regret that, in regard to the statistics of the Danish War of 1864, I cannot refer to the conclusions of the lamented Generalarzt F. LŒFFLER, from whose excellent *General-Bericht über den Gesundheitsdienst im Feldzuge gegen Dänemark* 1864, Berlin, 1867, the statistics

It will be observed, by comparing the tabular statement on page 434 of the *Surgical Volume* of Part II, that the relative frequency of shot wounds of the lower extremities does not exceed that of wounds of the upper limbs to the extent that might be anticipated from the greater size of the lower limbs. This is doubtless due to the fact that, in all fighting in entrenched positions, the lower part of the person is partially screened from injury. In the last year of the War, the field casualties of the Union armies were reported with much completeness and accuracy, as has been already noticed (*supra*, Part I, Vol. II, p. 600, Part II, Vol. II, pp. 6, 917), and over a hundred thousand cases of wounds were recorded with careful discrimination of their nature and position. In the engagements during this period, the combatants had learned to cover their positions with hastily improvised earthworks; and this may partly account for the smaller ratio of wounds in the lower limbs presented in these returns. Notice, for example, in the following tabular statement, the very small proportion of wounds of the lower limbs in the siege operations before Mobile. Another probable cause why the proportion of wounds of limbs was smaller in the field than in the general hospital returns, is that a large number of rapidly mortal wounds of the head and trunk appear on the field casualty lists, representing patients who never reached the base hospitals.

of wounds of the upper extremity in this campaign were cited in the *Second Surgical Volume* (Chap. IX, p. 434). This eminent surgeon died in 1874; and I have been unable to procure the second volume of his most painstaking and accurate treatise; or to learn that it has been published. Fortunately, Dr. HEINE'S statistics cover the ground, if not as thoroughly, at least with commendable precision. [7] These 24,788 cases are collected from the following authors: MCCORMAC (W.) (*Notes and Recollections of an Ambulance Surgeon*, London, 1871, p. 129; total number of cases, 610, lower extremities, 257); BILLROTH and CZERNY (*Chirurgische Briefe*, Berlin, 1872, p. 180;—277—135); RUPPRECHT (*Militärärztliche Erfahrungen*, 1871, S. 10;—361—128); MÜHLBAUER (*Erfahrungen aus dem Feldzuge, etc.*, in *Bayerisches ärtzliches Intelligenzblatt*, 1871, S. 374;—1899—849); STEINBERG (*Die Kriegslazarethe und Baracken von Berlin*, Berlin, 1871, S. 146;—8531—974); GOLTDAMMER (*Bericht über die Thätigkeit des Reserve-Lazarethes des Berliner Hülfsvereins*, in *Berliner Klin. Wochenschr.*, 1871;—639—67); HEYFELDER (O.) (*Bericht über meine Wirksamkeit am Rhein*, in *Petersburg Med. Zeitschrift*, 1871;—226—81); SOCIN (A.) (*Kriegschirurgische Erfahrungen*, Leipzig, 1872, p. 8;—643—328); MUNDY and MOSETIG (*Service Med. chir. de l'ambulance du Corps législatif*, in *Gaz. des Hôp.*, 1871, No. 149;—136—58); BECK (B.) (*Chir. der Schussv.*, 1872, S. 160;—4344—1787); FISCHER (H.) (*Kriegschir. Erfahrungen*, Erlangen, 1872, S. 28;—875—356); KIRCHNER (C.) (*Ærtzlicher Bericht u. s. w. im Palast zu Versailles*, Erlangen, 1872;—2099—751); GRAF (E.) (*Die Königl. Reservelazarethe zu Düsseldorf*, 1872;—298—101); SCHÜLLER (*Kriegs. chir. Skizzen*, Hannover, 1871;—491—166); GROS (F.) (*Notice sur l'hôpital civil, etc., de Strasbourg*, in *Gaz. Med. de Strasbourg*, 1872, No. 17;—140—55); BERTHOLD (*Deutsche Mil.-ärzt Zeitschrift*, 1872, B. I, S. 429;—1804—723); and MOSSAKOWSKY (P.) (*Deutsche Zeitschrift für Chir.*, 1872, B. I, S. 333;—1415—744).

Examining carefully several series of a thousand each of the 89,528 registered cases of wounds of the lower extremities,[1] including only those in which the seat of injury was noted with precision, a predominance of wounds of the left lower extremity is found in the following proportion: Both limbs, 3.4 per cent.; left limb, 53.1; right limb, 43.5.[2]

A word may be added regarding the recorded instances of evulsion of one or other of the lower limbs by solid shot, fragments of shell, torpedoes, or other large projectiles. Of 164 such instances 93 recovered, 62 or 40 per cent. were fatal, while in 9 instances the results were not ascertained. In 129 of the 164 cases it is noticed that ablations, many of them doubtless resembling merely the paring and regularization of the soft tissues with removal of splinters or sharp projections of bone, rather than legitimate amputations, were performed. Two of these, however, were successful formal disarticulations at the ankle joint, 2 successful amputations at the knee joint, 1 a fatal exarticulation at the hip. Seventy-six, with 56 recoveries, 14 deaths, and 6 unknown terminations, were operations in the continuity of the leg; forty cases, 26 successful, 13 fatal, 1 doubtful, were amputations in the thigh. In 4 cases, both legs were removed in the continuity with 2 recoveries, 1 fatal and 1 unknown result. In 1 fatal case the left thigh and right leg were simultaneously removed; in 1 case of recovery amputation was performed in the right thigh and through the left knee joint; in 1 fatal case simultaneous amputation of both thighs in the continuity was practised; and in one instance disarticulation of the left hip and ablation of the right leg was performed, the case terminating fatally. In 35 of the aggregate of 164 cases there is no record of operative interference. Of these, 1 was a fatal instance of evulsion of both limbs in the continuity of the thigh; in 6 fatal cases both limbs were torn off in the leg; in 4 fatal cases the right or left limb was torn off in the thigh, and in 24 the mutilation took place in the continuity of the leg with 4 recoveries, 19 deaths, and 1 with unknown result.

An additional proof that of the shot wounds received in action those inflicted upon the lower extremities ordinarily constitute about one-third of the aggregate, is found in the carefully prepared statistical researches of Councillor G. Fischer.[3]

---

[1] The lamented LŒFFLER, one of the soundest of modern Prussian military surgeons, sets forth (*General-Bericht über den Gesundheitsdienst im Feldzuge gegen Dänemark*, 1864, Berlin, 1867, p. 48) that of 2,388 Prussians killed and wounded in the Danish War of 1864, about 31 per cent. were struck in the lower extremities, and remarks (S. 49): "The comparatively small proportion of wounds of the lower extremities may appear strange. One is accustomed to regard the preponderance of such injuries as considerable. The protections above referred to (trenches, and, in Schleswig, brush-hedges [*Knicks*]) would undoubtedly partially protect the lower limbs. But statistics that omit the killed are defective; they give to the shot wounds of the extremities an undue preponderance, because their immediate fatality is much more limited than is observed in wounds of the head and trunk." Professor H. FISCHER (*Lehrbuch der Allgemeinen Kriegschir.*, Erlangen, 1868, S. 25) observes: "In later wars, in which the fighting was mainly in the open field, the remarkable fact has almost uniformly appeared, that among shot injuries those of the lower extremities far exceed those of the upper limbs. Dr. MACLEOD'S statistics refer 68 per cent. of wounds in action to wounds of the lower extremities. [This is an oversight. Dr. MACLEOD (*Notes on the Surgery of the War in the Crimea*, 1858, p. 414) gives the proportion of wounds of the lower extremities among the men as 31.7; among officers 35.2. Professor FISCHER seems to have added these ratios together.] DJOERUP reports the proportion of wounds of the lower limbs in the Danish army, in the war of 1848–50, as 40.5 per cent. In Paris in 1848, and in Italy in 1859, the wounds of the lower extremities constituted a third, and those of the upper limbs nearly another third. When it is considered that the remaining third was made up of cases of injuries of the head, chest, abdomen, and pelvis, it is apparent how enormously large is the number in modern wars that have to be transported with the utmost care and skill. Hence, perhaps, the most difficult problem for the modern military surgeon is the management of the ambulance trains. LŒFFLER, it is true, has said that the preponderance of wounds of the lower limbs in modern wars is seeming rather than real, and is conditioned on the less proportion of immediate fatality in wounds of the limbs. This assumption, though assuredly founded on facts, might explain the conspicuous fact that the shot injuries of the limbs predominate greatly over those of the head and trunk; but does not explain the extraordinary disproportion between the shot injuries of the upper and lower limbs." I may remark that the statistics I have examined do not show any greater disparity in the frequency of wounds in the upper and lower limbs than is warranted by the relative size and position of the extremities.

[2] HEINE (C.) (*Die Schussverletzungen der unteren Extremitäten*, Berlin, 1866, p. 30) remarks that in the Schleswig-Holstein War, 1860, 27 of the 562 cases of injuries of the lower extremities both limbs were injured, or a percentage of 4.8, and FISCHER (G.) (*Statistik der in dem Kriege* 1870–'71, *&c., vorgekommenen Verwundungen und Tödtungen*, Berlin, 1876) tabulates 780 cases of injuries of both limbs in a total of 20,160 cases of injuries of the lower extremities, or 3.8 per cent.

[3] The *Statistik der in dem Kriege* 1870–1871 *im Preussischen Heere, vorgekommenen Verwundungen und Tödtungen von* G. FISCHER comes to hand as these pages are going to press. Tabelle C (*loc. cit.*, p. 59) contains a recapitulation of the seat of injury in 64,897 cases (7,735 killed and 57,162 wounded). In 18,905 instances, or 29.14 per cent., the upper extremity was injured, and in 20,160, or 31.06 per cent., the lower extremity was involved, The latter percentage varies but little from that given on page 2 (*ante* 30.5), which was consolidated from a number of publications by various authors that have appeared since the late Franco-Prussian War.

Section I.

FLESH WOUNDS OF THE LOWER EXTREMITIES.

The reader is respectfully referred to the introductory observations to the first section of the Ninth Chapter, in Part II, Volume II, page 435, for many remarks on the Flesh Wounds of the Upper Extremities, which are equally applicable to the cases of the category now to be considered. The gravity of flesh wounds in the lower extremities greatly exceeds, however, that of analogous injuries in the upper limbs. The dangers arising from lesions of the great blood-vessels and nerves of the lower extremities, from peri-articular wounds, and especially from deep seton wounds and lacerations of the massive muscles of the thigh, are great. Many perforations of the thigh that are lightly regarded at the outset, present ultimately formidable complications. Dr. H. Fischer remarked,[1] in the late Franco-German War, that "many a wounded man sent to the rear with the diagnosis 'slight shot wound of the thigh,' succumbed to burrowing of pus, detected too late and treated with too little vigor. We had five such cases, and succeeded in all in controlling this terrible complication by early and deep incisions, absolute rest, and disinfecting bandages. When the first stage is neglected, the surgeon loses the mastery, pyæmia delighting to develop in deep phlegmonous cavities."

It was impossible, with the clerical force available, to make more than a superficial examination of the individual cases of the immense series of nearly sixty-thousand flesh wounds of the lower extremities.[2] All that has been attempted has been to sift out duplicated cases and those that ultimately proved to be complicated by contusion of bone or by fracture, and to scrutinize the series sufficiently to select instances illustrating the different varieties of injuries of this group, to determine the average distribution of the wounds in the several regions of the limb, and to ascertain approximatively the mortality.

Of the series of flesh wounds of the lower extremities, six hundred and seventy-four were punctured or incised, and fifty-eight thousand seven hundred and two were shot wounds.

PUNCTURED AND INCISED WOUNDS.—There were reported six hundred and seventy-four cases of punctured or incised wounds of the lower extremities, including a hundred and seventy-six bayonet wounds, twenty-two sabre wounds, and four hundred and seventy-six wounds from daggers, knives, axes, or other pointed or cutting weapons.

Bayonet Wounds.—The series of bayonet wounds included sixty-two stabs in the thigh, with two deaths; seventy-seven penetrations of the leg, with two deaths; and thirty-

[1] FISCHER (H.), *Kriegschirurg. Erfahrungen, Vor Metz*, Erlangen, 1872, S. 164. Dr. Fischer, professor of surgery at Breslau, was a volunteer surgeon in the Prussian army during the campaign from Saarbrücken to Metz, August 10 to October 27, 1870.

[2] Of the 89,528 registered cases of wounds of the lower extremities, 30,152, or 33.6 per cent., were returned as fractures, so that, as in the upper limbs, the wounds of the soft parts alone constitute very nearly two-thirds of the aggregate—59,376 in 89,528 cases.

seven wounds of the soft parts of the foot, with one death,—the series of a hundred and seventy-six cases thus presenting a mortality of 2.8 per cent. Several of the cases present particulars of interest:

CASE 1.—Private P. Dietrich, Co. E, 151st New York, aged 34 years, was wounded at Spottsylvania, May 12, 1864, and admitted to the field hospital of the 3d division, Sixth Corps. Surgeon R. Barr, 67th Pennsylvania, recorded: "A bayonet thrust through the right leg." The patient was transferred to Douglas Hospital, Washington, subsequently to Summit House, and lastly to the Satterlee Hospital, Philadelphia, whence he was discharged April 27, 1865, because of "lameness of the right leg, caused by chronic eczema," following a bayonet injury. Examiner H. N. Loomis, of Buffalo, New York, May 8, 1865, certified: "A bayonet was thrust through the right leg between the tibia and fibula, about six inches below the knee. The wound healed; but is followed by chronic eczema, extending from the knee to the ankle, much inflamed, with some ulceration, and producing so much lameness as to unfit him for any kind of labor." In August, 1868, the pension examiner states that the eczematous eruption occupies about half the space between the knee and the ankle, and that the limb is still inflamed, ulcerated, and swollen. This pensioner was paid to March 4, 1870, since when he has not been heard from.

In two cases the femoral artery was reported severed by a bayonet. One of these is related by Surgeon J. A. Lidell,[1] U. S. V.: A soldier of the 106th Pennsylvania received a thrust in the upper inner part of the thigh from a sabre-bayonet, in a picket skirmish near Fair Oaks, in June, 1862, and perished from hæmorrhage before assistance could reach him. The result of the second case suggests the probability that a minor branch, rather than the main femoral trunk, was injured by the weapon:

CASE 2.—Corporal E. Hacket, Co. A, 1st Pennsylvania Chasseurs, was accidentally wounded near Camp Whipple, Philadelphia, in August, 1863. Acting Assistant Surgeon L. D. Radzinsky reported: "While at bayonet exercise he received a punctured wound of the right femoral artery, below Poupart's ligament. The wound was received a short distance from the camp. When brought to the hospital tent the man was considerably exhausted from loss of blood. Judging from the clots found in his clothes he must have lost at least twelve ounces. The hæmorrhage was immediately controlled by manual pressure upon the external iliac artery, a compress and spica bandage applied, and pressure continued with a tourniquet for three days, at which time the tourniquet was removed, a new dressing applied, and pressure continued with the spica bandage. He was returned to duty five days afterwards, and has not had any untoward symptoms since." Hacket is not a pensioner.

Surgeon T. H. Squire, 89th New York, reports a case in which the synovial cavity of the knee was penetrated by a bayonet without bad results, remarking that Dr. James Allen, of Marathon, New York, examined the recent wound and concurred in the diagnosis:

CASE 3.—"Private C. A. Ball, Co. K, 89th New York, aged 16 years, in the spring of 1862, at Roanoke Island, while jumping for exercise, accidentally sprang against the point of a bayonet. At a moment when the joint was partially flexed, the point of the bayonet penetrated the cavity of the knee joint, the wound being immediately above the centre of the patella. The patient was immediately received into the regimental hospital, and Assistant Surgeon W. A. Smith, 89th New York, enjoined perfect rest in bed and low diet, with cold applications to the joint. The wound was from the first regarded as a dangerous one. Some days after the accident occurred, Dr. Squire saw the case with Dr. Smith. There was then synovial swelling of the joint, and other conclusive evidences that the joint had been penetrated. The boy was kept in hospital till the recovery was complete, when he again entered the ranks for duty. The recovery was complete, and no bad effects followed. The wound was not very extensive. The point of the bayonet may have gone through the synovial membrane half an inch or so, and in such a glancing direction as not to injure the cartilage or bone. Dr. Squire did not know exactly how long the boy was kept in hospital, but thought about four weeks." The field registers show that this Private Ball received a gunshot wound of the right side of the thorax at the battle of Chapin's Farm, September 29, 1864, which fact is corroborated by the examining surgeons. For this injury he is a pensioner, but the Pension Records make no mention of a bayonet injury of the knee.

Of the five fatal cases in this subdivision of bayonet wounds in the lower limbs, three succumbed from gangrene, one from pyæmia, and one from primary hæmorrhage. The following is one of the cases complicated by gangrene:

CASE 4.—Private S. Dick, Co. E, 79th Indiana, was wounded at Chickamauga, September 19, 1863, and sent to hospital No. 13, Nashville, October 1st. Assistant Surgeon J. K. Bauduy, U. S. V., reported: "He was admitted with a flesh wound of the calf of the left leg, caused by a bayonet. The wound was superficial and slight, and did well for several days; treated with cold-water dressings. On October 20th, hospital gangrene manifested itself; the disease was then prevailing endemically in the hospital. This patient was immediately transferred to the gangrene ward, and applications of pure bromine were made. Tincture of iron and fluid extract of cinchona were freely administered. Milk-punch and beef-tea were also given at stated intervals. His bowels, which were inclined to be costive, were kept open with enemeta of salt, molasses, and tepid water. The disease steadily progressed, and large sinuses formed in all directions in the intermuscular spaces. One immense sinus ran

[1] LIDELL (J. A.), *Bayonet Wounds, with cases*, in *Am. Med. Times*, 1866, Vol. VII, p. 153.

along the course of the tendo-achilles. The sinuses were freely opened and injected with chlorinated soda solution, and bromine was thoroughly applied, taking great care to get it well into the intermuscular spaces. Disinfecting poultices were used in the removal of the sloughs. November 4th, the gangrene at this date was entirely arrested, but symptoms of pyæmia arose. The pulse became frequent and weak, ranging between 140 to 150. Rigors; skin cold and clammy; breathing oppressed and labored. Patient complained of pain in chest. The conjunctiva assumed an icteroid hue, and the whole surface of the body became tinged with a pale yellow appearance. The knee and ankle joints commenced to swell and cause great pain. The following treatment was then resorted to: Carbonate of ammonia in large and frequent doses; stimulants every half hour; iron and cinchona continued; tincture of iodine and blisters to swollen joints; surface of body washed with whiskey and water. Patient continued to sink, and died on the afternoon of November 7, 1863. *Post-mortem:* Lungs healthy; no metastatic foci could be found in either of them or in the liver; but microscopical examination of the latter revealed a fatty infiltration. The liver was also greatly hypertrophied. The heart, spleen, pancreas, bowels, and kidneys were all healthy. There was an accumulation of pus in the left knee joint."

Sabre Wounds.—None of the twenty-two reported sabre-cuts of the lower limbs[1] were of a sufficiently grave character to prove fatal. Seventeen of the patients returned to duty, and five were discharged for slight disabilities. Six cases were flesh wounds of the thigh, ten of the leg, and six of the foot. One of the patients, Corporal Rice, 1st Vermont Cavalry, whose case is recorded on page 22 of the *First Surgical Volume*, suffered also from a sword-cut of the frontal; but he, with the rest, recovered without serious trouble.

Other Punctured and Incised Wounds.—Besides wounds caused by legitimate weapons of war, a considerable number were reported as inflicted by daggers, dirks, or bowie-knives, arrows, picks, and other pointed implements, and by knives, scythe-blades, hatchets, axes, and other cutting instruments. There were seventy-two of these serious punctured wounds of the lower limbs, and four hundred and four cases of severe incised wounds. There were eight deaths in this series of four hundred and seventy-six cases, a mortality-rate of 1.6 per cent., and disability leading to discharge from service resulted in a hundred and two of the cases. Twenty-eight cases were wounds of the thigh, a hundred and seventeen wounds of the leg, three hundred and thirty-one wounds of the foot.

Ligations.—In four instances, at least, of this series, ligations of arteries were practised on account of hæmorrhage or aneurism. One of these, an instance of aneurismal varix from puncture of the femoral artery and vein, by a pocket-knife, has been narrated, with a figure of the specimen, at page 336 of the *Surgical Volume* of Part II.[2] The three other cases were ligations of the tibial arteries:

CASES 5, 6, 7.—Assistant Surgeon J. C. G. Happersett, U. S. A., reports that Private T. J. Moore, Co. B, 82d Ohio, aged 29 years, received, July 14, 1865, a punctured wound near the right ankle. The hæmorrhage was so uncontrollable that, on July 22d, Assistant Surgeon H. M. Lilly, U. S. V., ligated the posterior tibial artery, placing a single proximal ligature. July 24th, unhealthy gangrene attacked parts, and bromine dressings were applied. The patient recovered, and was transferred to Jeffersonville October 19th, and to Post Hospital, Louisville, December 16, 1865.—6. Surgeon C. A. Cowgill reports that Lieutenant T. Linder, Co. E, 158th New York, aged 30 years, received, May 11, 1864, a punctured wound by a sharp knife on the inner side of the right leg at the juncture of the lower and middle thirds, dividing the posterior tibial artery through one half its diameter and causing a diffused traumatic aneurism. He was admitted into the Foster Hospital, New Berne, May 20th; the cellular tissue and intermuscular spaces were filled with coagula, which had temporarily arrested hæmorrhage. There was great tension and considerable sloughing of the soft parts. May 22d, Surgeon C. A. Cowgill, U. S. V., made an incision five inches long over the wound, through the integuments down to the posterior tibial artery, and, ligating it above and below the wound, the coagula were removed and the wound closed by adhesive straps. A good recovery ensued, and the officer returned to duty June 29, 1864.—7. Surgeon G. A. Otis, 27th Massachusetts, reports that Private C. D——, Co. B, 27th Massachusetts, in December, 1863, at Newport News, Virginia, received a severe wound in the left leg from an axe, about three inches above the annular ligament. The tendons of the tibialis anticus, the common and proper extensors, and the anterior

[1] In old times, and in the combats of the trained European Cavalry, sabre cuts of the lower limbs were not uncommon. RAVATON (*Chirurgie d'armée*, 1768, Chap. IX, p. 518) gives many examples, in which not only the soft parts but the bones were hacked by sword-cuts. M LEGOUEST also (*Chirurgie d'armée*, 2ème éd., 1872, p. 461) details several such examples, and refers to illustrations in the Museum of HUTIN at the Hôtel des Invalides. Abstracts of interesting incised wounds of the lower limbs may be found also in LE DRAN (*Observat. de Chir.*, 1731, T. II. p. 332) and in LA MOTTE (*Traité complète de Chirurgie*, 1771, T. III, p. 143 *et seq.*).

[2] First the femoral, then the external iliac, and finally and fatally the common iliac were ligated by Dr. J. B. CUTTER. The operator has published abstracts of these ligations in the *Am. Jour. Med. Sci.*, 1864, Vol. XLVIII, p. 36, *Ibid.*, 1865, Vol. L, p. 391. The pathological specimen, showing the communication between the artery and vein and the huge saeculation of the latter, is numbered 3597 in Sect. I of the Army Medical Museum.

tibial artery veins and nerve were divided, and the periosteum. The wound gaped widely, and the artery gave freely *per saltum*. The vessel was completely severed. Ligatures were at once placed by Dr. Otis about the upper and lower orifices of the artery, and the wound was united by sutures. Recovery was rapid and uncomplicated, and the soldier returned to duty.

Amputations.—In four instances, after deep incised wounds by axes, complications arose, and recourse was had to amputation. Two were thigh amputations:

CASES 8, 9.—Private Christian Webber, 8th Co., New York Independent Volunteers, received, September 24, 1863, a severe wound from an axe, severing the quadriceps of the left thigh two inches above the patella. He was sent to Fairfax Seminary Hospital, September 26th, and deep-seated suppuration having appeared, burrowed, and finally penetrated the knee joint, Surgeon D. P. Smith thereupon decided to amputate the limb. The operation was practised, October 4th, at the junction of the lower and middle thirds of the femur. The patient was transferred, convalescent, to York, Pennsylvania, October 30th, and subsequently discharged. The portion of the femur amputated has been catalogued in the Army Medical Museum,[1] but exhibits nothing abnormal.—9. Private T. H. Breckridge, Co. C, 6th New York Artillery, received a wound by an axe in March, 1864, and was sent to Armory Square Hospital. Surgeon D. W. Bliss, U. S. V., reported that the wound involved the right tarsus and metatarsus, and presently became erysipelatous, and that gangrene then supervened. On this account, on May 27th, Dr. Bliss amputated the limb, at the junction of the middle and lower thirds of the femur, by antero-posterior flaps formed by transfixion. Recovery was satisfactory. On December 28, 1864, he was supplied with an artificial limb at Ladies' Home, New York, by Dr. E. D. Hudson, at Government expense. The stump was then soundly healed, and "creditable" in shape. This soldier was discharged July 12, 1865, and pensioned. His pension was paid March 4, 1876.

In two instances the leg was amputated for incised wounds of the ankle or foot:

CASES 10, 11.—Private M. Dunham, Co. D, Engineer Battalion, aged 23 years, received a severe incised wound of the left ankle January 24, 1864. He was sent to hospital at Alexandria. Surgeon E. Bentley, U. S. V., reports that long-continued suppuration had ended in necrosis of the tibia-tarsal articulation, the patient being of a strumous habit. Dr. Bentley practised a circular amputation in the lower third of the leg May 5, 1864. Pyæmia supervened, and death ensued June 18, 1864.—11. Private A. Stacy, Co. H, 12th Kansas, received a severe wound of the left leg by an axe on March 17, 1864. He was sent to hospital at Fort Leavenworth. In September, 1864, the limb was amputated by short anterior and long posterior flaps by Dr. Clark. The patient recovered with a good stump, and was fitted with an artificial limb by B. Frank Palmer, at New York, June 23, 1866. He is a pensioner, and was paid March 4, 1876.

The foregoing instances comprise nearly all the seriously complicated cases reported of punctured and incised wounds of the lower extremities. There was a case (Private Wherry, 115th New York) where half the small blade of a pocket-knife broke off against the femur after perforating the quadriceps two inches above the knee joint; attempts at extraction of the foreign body failed; the patient recovered with partial false anchylosis at the knee. Except those noted, the examples of sloughing or consecutive bleeding were trivial, and no case of tetanus was observed.

SHOT FLESH WOUNDS.—In the vast series of fifty-eight thousand seven hundred and two cases of shot wounds of the soft parts of the lower limbs placed on the registers, it is difficult in many cases to determine, from the hasty field notes or brief hospital entries, the exact positions and extent of the wounds. As nearly as can be approximated, however, it would appear that about twenty-six thousand of these wounds were in the thigh, about twenty-one thousand in the leg, and about ten thousand in the foot, a certain number of reports presenting no indication of the precise seat of injury.

These wounds were of every grade of severity, from trivial skin-scratches to huge lacerations by large projectiles; long furroughed wounds with tortuous tracks, deep seton perforations, superficial or deep penetrations with lodgement of the missile, filling up the gamut. In reviewing the great series, two small groups especially claim attention—the wounds attended by lesion of the principal nerves, and those with injury of the main blood-vessels. We shall consider these first, and then typical examples of shot injuries of the soft parts, selecting for illustration those cases remarkable for extent of lacerations, those in which foreign bodies were lodged in the limb, those ultimately complicated by extension of inflammation to the joints, or by disease of the arteries, or by gangrene, tetanus, and other complications.

[1] See No. 2004, Section I, p. 364, of *Catalogue of the Surgical Section of the Army Medical Museum*, Washington, 1866.

Flesh Wounds of the Lower Limbs, with Injury of the larger Nerves.—Instances in which wounds of the larger nerves were sufficiently distinct and uncomplicated to be returned under this head were comparatively few; they were less frequent, indeed, than in the upper limbs.[1] The relations of the large nerve trunks of the lower extremities to the blood-vessels, bones, and joints are such that they are more liable to share in the injuries of these parts than in wounds mainly involving the muscular tissues. Moreover, it is probable that in many flesh wounds, nervous branches of magnitude were implicated without manifestation of any very serious results, and that such cases were not returned as injuries of nerves.[2] Presenting less urgency in relation to immediate treatment than lesions of the arteries and bones, these accidents nevertheless were frequently very grave, entailing a vast amount of protracted misery, and sometimes fatal consequences. Of fifty-nine cases referred to this category, thirty-one were reported as wounds of the sciatic, two of the crural, five of the long saphenous, one of the middle cutaneous, nine of the popliteal, five of the anterior tibial, three of the posterior tibial, and three of unspecified large nerve trunks. Eleven cases proved fatal, of which six succumbed from tetanus. Amputation was resorted to in four cases, briefly noted in succeeding tables. Two amputations in the thigh were successful; one through the knee joint, and one in the leg proved fatal.

Of thirty-one cases of wounds of the sciatic nerve, twenty-five recovered, including one in which amputation in the thigh was practised, and six were fatal. Four died of tetanus.[3] One succumbed, long after the injury, from secondary traumatic coxitis.[4] Erysipelatous inflammation with sloughing, extending to the hip joint, and resulting in ulceration of the cartilages and caries of the head of the femur and acetabulum. The fourth fatal case[5] was an example of exhaustion from protracted suffering. Of the

[1] As indicated in Part II, Vol. II, p. 461, there were 96 cases distinguished as nerve lesions of the upper extremities, contrasted with 59 instances in the lower extremities. Professor A. SOCIN (*Kriegschir. Erf.*, Leipzig, 1872, p. 64) remarks a similar disproportion in the Franco-German War. Relating 16 cases of shot injuries of the nerves, he observes that: "more than five-eighths of these concerned the upper extremities."

[2] In their treatise on *Gunshot Wounds and other Injuries of Nerves.* By S. WEIR MITCHELL, M. D., GEORGE R. MOREHOUSE, M. D., and WILLIAM W. KEEN, M. D., Philadelphia, 1864, the authors detail (pp. 92, 93) two cases of shot injury of the sciatic nerve: Private K. Grim, Co. B, 121st Pennsylvania, who received at Fredericksburg, December 13, 1862, a shot perforation of the left thigh, the ball entering externally four inches above the upper border of the patella, and emerging on the inside of the thigh, two inches lower down, slightly injuring the sciatic nerve. He had, July, 1863, severe burning on the dorsum of the left foot, and eczema, with ulceration about the nails, complete paralysis of the flexors of the foot and partial paralysis of the flexor communis and calf muscles. The other patient entered the hospital about the same time, a ball wound passing close to the sciatic. He had complete loss of power in the flexors of the foot, defective sensation on the outside of the leg and foot, and eczema with burning pain. Both patients were treated with electricity, with gradual gain of motion and relief of pain, and were regarded as fair types of partial wound or commotion of a nerve. At page 128, of the same work, the case of Private J. S. L. Scott, Co. F, 121st New York, aged 31 years, is related: He had a shot wound of the calf of the right leg, at Chancellorsville, May 3, 1863. The ball passed between the fibula and tibia about mid-leg. Total loss of motion below knee, slightly tactile insensibility, foot extended and powerless. September, 1863, rapid improvement followed alternated cold and hot douches, with faradization, and a splint to correct the malposition of the foot. Discharged, improved, February 12, 1864. The reports of Pension Examiners Mann and Lanning, of Manchester, Ohio, where this pensioner now resides, recapitulate the foregoing facts, and describe the paralysis as in all probability permanent. The latest report by Dr. Lanning, February 4, 1874, states that "paralysis of the foot and toes is nearly complete," and recommends that the pensioner be excused from further biennial examinations, as his disability is considered irremediable. This recommendation was opposed, and the pensioner's condition was unchanged when he was last paid, March 4, 1876. In *Circular* 6, S. G. O., 1864: On *Reflex Paralysis* resulting from shot wounds, the same authors narrate two examples of reflex paralysis of the upper extremity induced by shot flesh wounds implicating the nerves of the lower limbs: Private W. W. Armlin, Co. D, 134th New York, aged 23 years, was shot at Gettysburg, July 1, 1863, the ball entering anteriorly about midway on the inner part of the right thigh and emerging outside and below the tuberosity of the ischium, just above the fold of the nates. The sciatic nerve was probably injured. There was partial paralysis of the right leg, and reflex paralysis of the right arm. The latter speedily recovered.—Private D. Kent, Co. B, 145th Pennsylvania, aged 24 years, was struck, at Gettysburg, July 2, 1863, over the upper third of the right rectus femoris, by a musket ball, which passed through the thigh, emerging at the inner side a little below the fold of the nates. There was loss of motion and sensation in the thigh and leg, and reflex motor paralysis in the right arm. The patient was discharged January 20, 1864, for tuberculosis. The paralysis had amended under the use of hot and cold douches, active motor, and faradization. In his work, entitled *Gunshot Wounds of the Nerves and their Consequences*, Philadelphia, 1872, Dr. S. WEIR MITCHELL cites the case of Sergeant C. Beatty, 26th Pennsylvania, shot through the calf, at Chancellorsville, May 3, 1863, who suffered intensely from causalgia. The foot, a few days after injury, was prickling and burning intensely. After a fortnight the prickling ceased; but the burning persisted. He recovered in about five months, without treatment. In this valuable work, abounding in illustrations of the effects of shot lesions of the nerves of the trunk and upper limbs, I find no other example of shot wound of the nerves of the lower extremities.

[3] Privates Albro, 27th Michigan; Fry, 3d New Jersey; Riley, 10th New York; and Smith, 46th New York.

[4] Case of Private *T. J. Dame*, Co. E, 18th Mississippi, wounded at Antietam, September 17, 1862. Died June 19, 1863. See *Spec.* 3849, A. M. M., *Cat. Surg. Sect.*, 1866, p. 243.

[5] Case of Private E. M. McGregor, Co. C, 76th New York, shot through the left sciatic nerve September 6, 1862. The missile lodged and could not be detected during life. He had motor paralysis of the leg muscles, and intense pain in the upper part of the track of the perineal and anterior tibia, and used hypodermic injections of morphia. He died February 1, 1863.

twenty-five survivors, one fully recovered and returned to duty, three entered the Veteran Reserve Corps, and twenty-one were discharged. With few exceptions, they suffered from neuralgia or from partial motor paralysis. One (Private Armlin, 134th New York) had reflex paralysis of the arm on the side corresponding with the injury to the sciatic nerve.[1] Notes of two of the cases of persistent neuralgia are appended:

CASE 12.—Private W. T. Burk, Co. F, 151st New York, aged 24 years, was wounded at Monocacy, July 9, 1864, and admitted to hospital at Frederick the following day. Acting Assistant Surgeon E. R. Ould reported: "Gunshot flesh wound of both thighs, perforating upper third and injuring the sciatic nerve of the right thigh. The patient is of a nervous and irritable temperament. Simple dressings were applied, and opiates given at night; wound healing. July 20th, great pain complained of in the course of the sciatic nerve and increasing in the region of the foot and ankle; pulse accelerated, 100 per minute; pain increasing; general appearance moderately good; appetite poor. Applied pounded ice to foot and gave two drachms of solution of morphia four times a day. August 1st, the ice moderated the amount of pain; treatment continued. Patient slept half the night. August 12th, patient much improved; ice discontinued; prescribed morphia, iron, and quinine four times a day. September 1st, pain more severe; the wounds have entirely healed; treatment continued. September 20th, walking about with crutches, but very lame; stimulating and anodyne liniment used night and morning. September 25th, patient finds great relief by keeping his hands wet with water; bowels regular; pulse natural. October 1st, but slight improvement; continued the quinine and iron mixture, also one drachm of fluid extract of cimicifuga. October 30th, still walks lame, the leg being very painful on motion. October 31st, furloughed this day; patient has but little prospect of a speedy recovery." He subsequently returned to the hospital, and was mustered out of service May 31, 1865, and pensioned. Examiner J. H. Helmer, of Lockport, New York, February 9, 1866, certified: "Ball entered right thigh, upper third, passed through in front of the bone, and through the left thigh back of the bone, destroying the femoral nerve. Left leg two inches smaller than the right; muscles flabby; no voluntary motion of the left foot. He can walk, but walks like a paralytic." At a subsequent examination it was additionally reported that "the temperature of the left leg and foot is reduced," etc. The pensioner was paid June 4, 1876.

CASE 13.—Private C. J. Keegan, Co H, 80th New York, aged 40 years, was wounded at Gettysburg, July 1, 1863, and entered the York Hospital on July 19th. Acting Assistant Surgeon G. Byers reported: "Gunshot flesh wound of right thigh; ball entered the middle third below the edge of the sartorius muscle, passing upward and outward, made its exit two inches below and behind the trochanter, injuring the great sciatic nerve in its course. The wound closed kindly; the leg and foot, however, continued œdematous, and the man has suffered very greatly with pains of a darting character. He has at no time been able to use the limb since the receipt of the injury. Liniment of aconite was applied to the leg, and opiates were given internally. May 23, 1864, the pain has much diminished in intensity within the last two months." The patient was discharged from service June 28, 1864, and pensioned. Examiner H. B. Day, of Utica, New York, certified, February 16, 1865: * * "The great ischiatic nerve must have been injured, as he has constant pain, numbness, and partial paralysis of the parts supplied by this nerve and its branches, rendering him unable to stand for any length of time," etc. Examiner I. Spencer, of De Ruyter, certified, October 19, 1865: "Permanent lameness of the thigh. The foot is also deformed by an unnatural action of the muscles contracting the toes obliquely, and there is an unnatural fixedness of the arch of the foot," etc. Subsequent examiners reported substantially the same, and all concur in their belief as to the nerve injury. This pensioner was paid June 4, 1876.

The two patients wounded in the anterior crural nerve, were discharged without relief of the persistent pain that followed their injuries. Surgeon I. I. Hayes, U. S. V., has furnished a detailed report of one of the cases:

CASE 14.—Private W. H. Cookson, Co. E, 42d New York, aged 23 years, was wounded at Antietam, September 17, 1862, and entered the Satterlee Hospital, Philadelphia, nine days afterwards. Four months after his admission Surgeon I. I. Hayes, U. S. V., reported: "He was wounded by a minié ball entering on the outer side of the right thigh, about midway between the anterior superior spinous process of the ilium and the trochanter major, and, passing obliquely upward, made its exit near the middle of Poupart's ligament, wounding, I infer, the anterior crural nerve, from the intense pain he has suffered in the course of that nerve. The wound has long since healed. The suffering experienced over the front and side of the thigh, parts supplied by the anterior crural nerve, is instructive as showing the effect of an injury in the course of a nerve manifesting itself in the extremities of that nerve. The pain has not abated by the use of the most powerful anodynes, and sleep is only procured through the influence of sulphate of morphia. A question, which is still 'subjudice,' arises: Shall we excise that portion of the nerve which is wounded, hoping thereby to relieve his almost intolerable suffering?" The patient was discharged from service February 28, 1863, and pensioned. Drs. T. S. Johnston and R. H. Hope, of Rock Hill, S. C., in certifying to the results of the wound, May 9, 1874, stated that "from this cause he is now suffering with neuralgia and partial paralysis of the extensor muscles of the thigh." The pensioner was paid June 4, 1876.

Of the five cases of wounds of the long saphenous, one resulted in complete recovery,

[1] J. MASON WARREN, in an interesting article on *Neuralgic Affections following Injuries of Nerves*, in *Am. Jour. Med. Sci.*, N. S., 1864, Vol. XLVII, p. 316 (which is reproduced in his excellent *Surgical Observations*, Boston, 1867, p. 465), details the case of a soldier with wound of the sciatic nerve, who was probably Private D. Callahan, Co. E, 19th Massachusetts, aged 22 years, whose history on the registers of this Office closely corresponds to the graphic description given by Dr. Warren, to which the reader is referred. His Pension Report for 1876 may be added: There was atrophy of the injured thigh and leg, with diminished temperature and greatly diminished motor power in the muscles of the leg and foot.

four in more or less paralysis and atrophy.[1] The case of wound of the middle cutaneous nerve was attended with severe neuralgia, which yielded to blistering and other remedies, and the patient returned to duty.

The series of nine cases of wounds of the popliteal nerve comprises a fatal case of tetanus.[2] The other patients recovered, and three entered the Veteran Reserves, while five were discharged, one after recovery from amputation in the thigh, and one with excruciating neuralgia.

The category of five cases of wounds of the anterior tibial included one death from tetanus.[3] The four survivors had partial paralysis of the extensor muscles. An instance is detailed:

CASE 15.—Private D. S. Pierce, Co. B, 1st Michigan, aged 22 years, was wounded at Bull Run, August 30, 1862, and admitted to Ryland Chapel Hospital, Washington, three days afterwards. Surgeon J. A. Lidell, U. S. V., reported: "The patient was admitted to Stanton Hospital from Ryland Chapel, December 5th, with wound in the right leg. The bullet entered the outer part of the front of the middle third of said leg, about midway between the tibia and fibula. The bullet did not go through the limb. It, however, went in so deep that it could not be reached by exploration. The wound has been healed since the middle of October. The missile has gravitated through between the tibia and fibula, and can now be felt deeply seated in the muscles of the calf. It gives him no trouble. The anterior tibial nerve was divided by the bullet, in consequence of which the muscles of the front of the leg are paralyzed. The end of the foot points downward from activity of those on the back of the leg, and the case resembles talipes equinus. The patient walks haltingly, but without a cane, by the aid of a high-heeled shoe. He has suffered but little pain since the wound healed, and considers himself to be slowly improving. He was discharged December 16, 1862." Examiner D. Hudson, of Lansing, Michigan, reported, May 8, 1863: "Ball passed through both peroneal muscles, dividing the tibial nerve * * and lodging deep in the soleus muscle. Ankle joint became stiff at an obtuse angle, requiring a heel more than an inch higher on the right shoe than on the left one. Neuralgic pain in foot and ankle daily and hourly." Drs. J. B. Hull and I. H. Bartholomew, of the Lansing Examining Board, certified, December 7, 1870: "The ball passed down, and now lies under the skin above the inner malleolus. He cannot stand on his leg but a short time, and is getting worse," etc. They also stated that they excised the ball, and reported, September, 1872: "The nerve is diseased, and he suffers great pain through the whole leg; is emaciated and feeble, and growing worse." This pensioner died of "consumption," November 22, 1872, superinduced, in the opinion of the attending physicians, by "the continually depressing effects of the pain and tenderness of his limb."

The three cases of wounds of the posterior tibial nerve were fatal. Two involved unsuccessful amputations, one at the knee joint and one in the leg, and the third was fatal from gangrene.[4] The two amputations were practised after tetanus had supervened:[5]

CASE 16.—Corporal B. Prather, Co. D, 103d Ohio, aged 18 years, was wounded at the battle of Nashville, December 15, 1864, and was admitted to the Cumberland Hospital on the following day. Surgeon B. Clark, U. S. V., reported: "Gun-shot wound of right foot, ball entering immediately under the metatarsal bone of the great toe and burying itself in the plantar fascia. The soft parts were remarkably sensitive in the vicinity of the wound, showing a great degree of muscular and nervous irritability. The foot was not swollen, the bones were not fractured, nor the tissues severely lacerated. December 26th, the ball was removed by Acting Assistant Surgeon S. G. Ayres; second operation, exsection of a half inch of the posterior tibial nerve, behind the inner malleolus, by Assistant Surgeon W. B. Trull, U. S. V.; third operation, amputation of the toe, with removal of the first metatarsal bone, by Acting Assistant Surgeon L. E. Tracy. The patient complained, on December 26th, saying that a feeling of stiffness had been coming on for three days, especially in the shoulders, neck, and jaws. The latter gradually closed until it was impossible to introduce food into his mouth. There was a tetanic spasm of the muscles of deglutition, so that the patient was dying from inability to swallow. Chloroform alone seemed to afford temporary relief from his intense sufferings. Relaxation of the jaws was effected by division of the nerve, but the spasms of the muscles immediately returned. At midnight of the 27th, amputation at the lower third of the leg was performed by Acting Assistant Surgeon S. G. Ayres, but without effect. Large opiate injections were afterward given, and the patient obtained sleep. A copious warm perspiration breaking out upon the face and the improved pulse were considered favorable symptoms. Died December 28, 1864."

The three cases of shot wounds of unspecified nerves were probably examples of

[1] Cases of Lieutenant A. Rodman, 2d Wisconsin, wounded in 1862, and who recovered. Also of Private W. Lette, Co. F, 29th New York, wounded at Bull Run, August 29, 1862; Corporal A. McNeal, Co. A, 121st New York, wounded October 19, 1862; Sergeant *C. E. Clark*, Co. H, 32d Virginia, wounded at Spottsylvania, May 12, 1864; and Private P. J. Vimont, Co. C, 7th Kentucky Cavalry, who were discharged for disability.

[2] Case of Private *J. G. Grissetta*, Co. D, 2d Alabama; wounded at Fort Blakely, April 9, 1864; died April 21st. It is stated that the popliteal nerve was "dark and disorganized."

[3] Private *James Rollins*, Co. H, 28th North Carolina, aged 30 years; wounded at Gettysburg, July 3, 1863; tetanus July 20th; death, July 22, 1863.

[4] Case of Private G. Richmond, Co. D, 111th New York, wounded at Bristow Station, October 14, 1863, in the upper third of the left calf by a carbine ball. He was sent to the Third Division Hospital at Alexandria. The wound was dilated by an incision. Gangrene appeared and spread very rapidly, and death took place October 23, 1863.

[5] CASE 16, and the case of Private J. Leonard, Co. G, 5th Ohio, aged 22 years, wounded at Gettysburg, July 3, 1863; tetanic symptoms July 14th, amputation at knee joint July 16th, and death three hours after.

injuries of the sciatic in one instance, of the anterior and posterior tibials in the others. Abstracts of two of the cases are subjoined; the third case has been published, and has been noticed in the foot-note on page 9 (case of Private J. S. L. Scott, 121st New York).

CASE 17.—Sergeant J. W. Crane, Co. A, 79th New York, aged 27 years, was wounded at Bull Run, August 30, 1862, and admitted to Judiciary Square Hospital, Washington, one week afterward. On May 9, 1863, he was transferred to DeCamp Hospital, David's Island, whence Acting Assistant Surgeon J. W. Dickie reported: "A ball passed through right thigh at about the junction of the upper and middle thirds. The wound closed about the first of March, and a small abscess formed, about that time, a little below the wound. When the abscess healed a pain commenced in the left hip joint, extending to the foot. This pain was constant. No pain was felt in the right leg except when pressure was made on the wound. The pain was most severe in the hip and calf of the leg. It would at times ascend and affect the respiratory muscles, causing great distress and difficulty in breathing. Appetite poor when admitted, yet the patient is quite fleshy. Had taken considerable quantity of morphia, so much as to be free from pain. May 13th, had recurrence of pain and dyspnœa, and spasm of upper extremities. Gave chloroform, twenty drops, and repeated the dose in fifteen minutes. May 17th, had another spasm; same treatment. Has slighter attacks more frequently, which are relieved by exposure to cold. May 19th, had another spasm; two grains of sulphate of morphia given; pain checked. May 24th, another spasm; gave chloroform one drachm, and sulphate of morphia one grain; pain relieved. On the next day cauterization was performed along the course of the great ischiatic and peroneal nerves. May 28th, gave nine grains of sulphate of quinine and a half grain of sulphate of morphia, and repeated every evening. May 29th, had a recurrence, but not much spasm. June 12th, the cauterized surface is healed; patient improving and has but little pain. June 22d, walked out, supporting himself by means of canes." The patient was subsequently transferred to McDougall Hospital, where he was recorded as having been "returned to duty December 28, 1863." The records, however, do not show that he resumed active duty in the field. He was mustered out October 6, 1864, and pensioned. The Hartford Examining Board certified, May 3, 1871: * * "The muscles and skin are bound down to the bone and are much impaired in action. Partial paralysis of both limbs, owing to the injury to the nerves." The same Board reported, September 15, 1873, that "owing to the injury to some nerve he suffers excruciating pain on slight exercise or change of temperature," and, at a subsequent examination, they stated that "pain extends to the spine and down the other leg, and the limb at such times is drawn up spasmodically;" also that "he is confined to bed from one to three months every year," etc. The pensioner was paid June 4, 1876.

CASE 18.—Private J. W. Young, Co. E, 137th New York, aged 27 years, was wounded at Gettysburg, July 2, 1863, and admitted to Harewood Hospital, Washington, three weeks afterward. Acting Assistant Surgeon T. H. Elliott reported: "Gunshot wound of right leg. Ball entered through upper portion of gastrocnemius muscle and emerged near the head of the fibula. The foot, immediately after the injury, dropped to full extension; all of the muscles of the leg paralyzed from division of nerves; flexors of thigh contracted, causing the heel to be raised from the floor three inches in the erect posture. Patient is unable to bear any weight on the limb. August 6th, wound unhealed; paralysis of extensor muscles complete. Patient discharged from service August 16, 1863." Examiner J. G. Orton, of Binghamton, New York, September 15, 1866, certified: "The power of flexion of the foot upon the leg is impossible in consequence of injury to flexor muscles; walking is performed with much difficulty and not without assistance." On February 29, 1876, he reported: * * "The power of flexion of the foot is entirely gone. It is at present almost worthless, the foot being swollen, and drags when he walks; he cannot walk without assistance." The pensioner was paid March 4, 1876.

In addition to the cases of reflex paralysis cited from Dr. Keen in foot-note 2 on page 9, a report of an instance of this rare affection is given below.[1] Special reports of operations on this subject are infrequent.[2]

---

[1] Private C. Sullivan, Co. K, 69th New York, aged 36, was wounded at Spottsylvania, May 10, 1864. From a field hospital of the Second Corps he passed to Douglas Hospital at Washington, and thence to South Street at Philadelphia, from all of which places "a shell wound of the left leg" was reported. Assistant Surgeon S. A. STORROW, U. S. A., in charge of the Filbert Street Hospital, described the injury as "a shot wound of the gastrocnemius muscle, involving the posterior tibial nerve." Acting Assistant Surgeon L. Tosier reported the patient's admission to the Ladies' Home Hospital, New York City, November 7th, and the following history: "A shell wound of the posterior portion of the leg, severing the lower portion of the gastrocnemius muscle. The wound has healed with considerable contraction of the parts, flexing the foot strongly and leaving the ankle joint exceedingly tender and painful—almost immovable. On the morning of July 11th the patient awoke with almost complete paralysis of each forearm and hand, in which condition they yet remain." The patient was discharged December 9, 1864, and pensioned. Examiner E. Bradley, of New York, on February 10, 1866, certified to atrophy of the wounded limb and an open ulcer occupying the lower and posterior surface: also to partial paralysis of the right hand. The New York Examining Board reported, September 11, 1872: "A shell wound, etc., leaving a tender cicatrix which is constantly breaking open. Locomotion is interfered with. The limb is very tender, and it is painful for him to walk. He cannot move his right hand on account of total paralysis of it, nor close the fingers. He states that both hands became paralyzed after he was wounded, and that he recovered the use of the left hand, but the other hand remained useless. We cannot discover any connection between the wound of the leg and the paralysis of the hand." Dr. A. B. MOTT, of New York City, who was surgeon in charge of Ladies' Home Hospital at the time of the pensioner's discharge from service, certified, February 22, 1873: 'At the time of his admission to the hospital the patient had lost the use of both arms, but he recovered the use of the left arm. As far as my memory serves me, it was my opinion at that time that the paralysis was due to shock at the time of receiving the wound" The pensioner was paid June 4, 1877.

[2] On wounds of the nerves of the lower extremities the reader can consult, in addition to the works already cited, and the researches of CRUIKSHANK, FONTANA, J. F. MECKEL, RETZIUS, TIEDEMANN, and other experimenters in surgical physiology on the results of division of the nerves, the following authors: DESCOT, *Diss. sur les affections locales des nerfs*, Paris, 1822, No. 233; SWAN (J.), *A Treatise on Diseases and Injuries of the Nerves*, 2d ed., London, 1834; HAMILTON (J.), *On some effects resulting from Wounds of Nerves*, in *Dublin Jour. of Med. Sci.*, 1834, Vol. XIII, p. 38; WALLER, *Nouv. meth. anat. pour l'investigation du système nerveux*, Bonn, 1852; PHILLIPEAUX and VULPIAN, *Recherches sur la régéneration des nerfs*, in *Mem. de la Société de Biologie*, 1859; DUCHENNE, *De électrisation localisée, etc.*, 2d ed., 1860; LONDE, *Recherches sur les névralgies, consécutives aux lesions des nerfs*, Paris. 1860, No. 199; TILLAUX (P.), *Des Affections Chirurgicales des Nerfs*, Paris, 1866; PAULET, *Les Suites immediates et eloignees des lesions traumatiques des nerfs*, in *Gaz. Hebdom.* de Paris, 1868, T. V, p. 283; FOLLIN (E.), *Traité élém. de path. ext.*, Paris, 1867, T. II. p. 233.

Flesh Wounds of the Lower Limbs with Injury of the larger Blood-vessels.—As indicated in my preliminary surgical report in *Circular* 6, S. G. O., 1865, p. 38, shot wounds of the larger arteries of the lower extremity, the femoral, profunda, peroneal, and tibials, uncomplicated by fracture of the adjacent bones, or by extended disorganization or complete removal of the limb by the impact of large projectiles, that come under the treatment of the military surgeon, are comparatively infrequent. It is difficult to convince surgeons who have had little field practice of the rarity of this form of accident.[1] It is strikingly illustrated by the fact that, in the series of fifty-eight thousand seven hundred and two cases of shot flesh wounds of the lower extremities we are now discussing, only a hundred and fifty-six instances of this particular lesion, or 2.6 per thousand, were reported. Of one hundred and fifty-six cases, thirty-three were treated without operative interference, eighty-seven by ligation, twenty-three by amputation, and eight by ligation followed by amputation. These four groups will be separately considered.

Wounds of Blood-vessels treated without Operation.—This group comprises eighteen cases of wounds of the femoral artery, in two of which the femoral vein was likewise implicated. Of these fifteen terminated fatally. There were three fatal cases in which the femoral vein alone was involved. There were four cases of wounds of the popliteal, with two recoveries. Of two cases of wounds of the posterior tibial, one complicated by wound of the peroneal was fatal. Of two cases of wounds of the peroneal one was fatal, and the result in the other case cannot be ascertained. Two cases of wounds of the internal saphenous vein resulted favorably, as did a case of wound of the dorsalis pollicis. A case of wound of an unspecified artery of the lower extremity had a fatal result. Twenty-three of the thirty-three cases terminated fatally, a mortality of 71.8 per cent. A few examples of these injuries will be detailed, commencing with a case of occlusion of the femoral artery from contusion, and two instances of direct lesion of that vessel:[2]

CASE 19.—Private S. T. Newell, Co. B, 1st U. S. Artillery, aged 21 years, was wounded at Gettysburg, July 2, 1863, and entered the Satterlee Hospital, Philadelphia, July 11th. Acting Assistant Surgeon W. C. Dixon reported: "The missile, a piece of shell, struck the inner side of the left thigh, middle third, producing a severe flesh wound. Simple dressings were applied. On the 19th the wound assumed a gangrenous appearance; a mixture of equal parts of creasote, alcohol, and water was applied. Under that treatment it remained about the same until July 28th, when the sloughing commenced to spread rapidly and nitric acid was applied. On the 29th the femoral artery was exposed at the upper and lower edges of the wound, with a large amount of sloughing tissue occupying the intermediate space. Two days later the slough was removed from around the artery, which was found to have been converted into a fibrous cord bearing no resemblance to an artery. It was watched closely to guard against hæmorrhage. At 2 o'clock P. M. on August 1st the artery separated, and the proximate and distal extremities of the vessel were found to be perfectly occluded. The wound healed rapidly, and in September the patient was transferred to Fort Hamilton." He was discharged, at Fort Independence, December 7, 1863, and pensioned. Examiner J. H. Crombie, of Derry, N. H., certified, May 6, 1874: * * "Was struck by a piece of shell, * * making a wound six inches in length and three in width, penetrating nearly to the bone. The limb is weakened very much. The muscular power is considerably limited. He is unable to walk or labor on the limb for any length of time by reason of weakness." The pensioner was paid June 4, 1876.

[1] HEINE (C.) (*Die Schussverletzungen der unteren Extremitäten*, Berlin, 1866, p. 127) remarks that: "The rarity with which shot injuries complicated by serious arterial hæmorrhages present themselves to surgeons at the stations for first dressings (*erste Verbandplatz*) is an experience that repeats itself in every campaign. Hence operative interference on account of wounded blood-vessels is seldom necessary at this stage. From the last war [the Danish war of 1864] I cannot recall a single case in which ligation or amputation was performed for primary bleeding at the field ambulance stations." The first chapter of GUTHRIE'S *Commentaries on the Surgery of the Peninsular War*, that excellent *vade-mecum* of the military surgeon, and the chapter on gunshot wounds of the extremities by MATTHEW, the historian of the surgery of the British army in the Crimea, have already established the doctrine above enunciated. The misconceptions which such an authority as VALENTINE MOTT adopted in his paper *On Hæmorrhage from Wounds*,—a paper contributed to the publications of the SANITARY COMMISSION,—can only be explained by his comparatively slight acquaintance with the effects of shot injuries.

[2] Of the remaining fifteen cases of shot wounds of the femoral artery treated on the expectant plan, one resulted successfully—case of *Wammack*, 5th North Carolina—and fourteen fatally, viz: Dinguid, Griffin's Battery; *Ledbetter*, 9th Alabama; Sylvester, 9th New Hampshire; Riming, 81st Pennsylvania; Corris, 17th Illinois; Collins, Ordnance Corps; Blaisdell, 17th Massachusetts; Lawrence, 9th New York Cavalry; Masser, 143d Pennsylvania; Craft, 144th New York; Stephen, 147th New York; *Geary*, 4th Georgia; Bailey, 8th Illinois Cavalry, and Clarendon, 26th Massachusetts. In the last two cases the femoral vein was also implicated. It is impracticable to give the details of these cases, but the names are mentioned in order that students of this special subject may be enabled to refer to them in the MS. records of the Surgeon General's Office.

Of the cases of wounds of the *femoral artery* treated without operation, a case of recovery and a fatal case will be detailed:

CASE 20.—Lieutenant L. Hallman, Co. D, 51st Pennsylvania, aged 24 years, was wounded at South Mills, April 19, 1862, and admitted to Hygeia Hospital, Fort Monroe, five days afterwards. Surgeon R. B. Bontecou, U. S. V., reported: "Gunshot wound of femoral artery, a bullet traversing the middle of the left thigh, entering anteriorly, and escaping on the posterior aspect just opposite. Pulsation could indistinctly be felt in the pedal and posterior tibial arteries. About one week after admission a smart arterial hæmorrhage came from the anterior wound. Compression by a bandage and cold wet applications were made, and the hæmorrhage was controlled, but returned the next day. We proceeded to his room to tie the femoral; on consultation, however, it was decided to wait, and, if it should bleed again, to operate. He continued doing well. Treatment: Absolute rest and cold wet applications, ice in small portions being allowed to melt on the bandage which surrounded the thigh. May 20th, abscess of the skin appeared, and discoloration of the great toe, which eventually sloughed to the first phalanx; temperature of the foot all the while good. He was sent to Philadelphia, in June, quite well." Lieutenant Hallman was transferred to the Veteran Reserve Corps on March 14, 1864, and ultimately mustered out of service June 30, 1866, and pensioned. Examiner W. Carson, of Norristown, Pennsylvania, March 3, 1867, certified: "Ball passed through left thigh, * * wounding the sciatic nerve; has lost first joint of great toe, with immobility of all the toes. Atrophy of limb equal to one inch in circumference; foot cold." Examiner H. E. Goodman, of Philadelphia, certified, September 18, 1869: * * "Limb much weakened and painful all the time." The pensioner died, of consumption, November 24, 1871.

CASE 21.—Sergeant H. Booth, Co. E, 7th Indiana Cavalry, aged 24 years, was admitted to the Gayoso Hospital, Memphis, April 18, 1864, having been wounded on the previous day by the accidental discharge of a revolver held in the hands of one of his comrades. Surgeon F. N. Burke, U. S. V., made the following report: "The ball entered the left thigh directly over the course of the femoral vessels, two inches below Poupart's ligament, and escaped at the crease of the nate and median line of the left thigh. There was copious hæmorrhage at the time the wound was received, but it was arrested by application of the tourniquet. As a precautionary measure it was left on at the time of admission, but not tightened. The wound became unhealthy and had a gangrenous smell on the fourth day. Charcoal cataplasms were then applied, and Labarraque's solution used to the wound. On the sixth day hæmorrhage again occurred, amounting to about six ounces, but pressure again arrested it. For the twenty-four hours preceding this the whole limb had become swollen and œdematous, especially the upper portion of the thigh. The patient had become very much prostrated and his pulse quite weak. He was naturally of a weak constitution. It was thought that to tie the artery there would result in gangrene of the limb, as its vitality was evidently quite low, and, the wound being unhealthy, secondary hæmorrhage from the sloughing of the vessel would be imminent. Amputation was then thought of, but it was obvious that the patient was too much prostrated to hope for a successful result. Oozing of blood occurred a couple of times during the ensuing few days, but the formation of a small clot was sufficient to arrest it. He died on April 28, 1864. The *post-mortem* examination discovered the femoral artery to have been perforated so as to admit the passage of a duckshot through the wound about half an inch below the origin of the profunda. The femoral vein was found to have sloughed for a distance of about one and a half inches, gangrene having extended along the fascia and cellular planes from one to one and a half inches at different parts along the course of the wound. The ball had passed between the femoral vessels and the femur."

Of the four cases of injury of the *popliteal artery*, a fatal instance and one that eventually resulted in fatal aneurism are selected for illustration:[1]

CASE 22.—Private J. C. Mapes, Co. K, 103d Pennsylvania, aged 22 years, was wounded in the left leg at Kinston, December 14, 1862, and entered the Stanley Hospital, New Berne, six days afterwards. Acting Assistant Surgeon J. B. Upham reported: "A minié ball entered three inches above the knee joint, on the inside, over the track of the femoral artery, and passing downward and backward emerged in the popliteal space near the insertion of the biceps, lacerating, in its course, the popliteal artery. His condition at the time of his admission was one of great mental and bodily depression. He was treated by stimulants, warm applications, and generous diet. Three days afterwards, secondary hæmorrhage coming on, attempt was made to ligate the femoral artery by dilating the wound, which failed. Amputation was not resorted to on account of the condition of the patient. Gangrene below the point of the injury came on rapidly, and the patient died December 29, 1862, fifteen days after the reception of the wound. The *post-mortem* examination revealed the injury of the artery already alluded to, which extended for a considerable distance, the track of the ball being almost in a direct line with the course of the vessel itself."

The other case referred to is a remarkable example of aneurism developed after fourteen years, as the remote result probably of a shot contusion of the popliteal artery:

CASE 23.—Private W. Young, Co. K, 4th New York, aged 19 years, was wounded at Fredericksburg, December 13, 1862, and admitted to Campbell Hospital, Washington, four days afterwards. Surgeon J. H. Baxter, U. S. V., recorded: "Gunshot wound of leg; patient transferred to Baltimore January 8, 1863." Surgeon L. Quick, U. S. V., reported that the patient was discharged from McKim's Mansion Hospital, March 18, 1863, for "gunshot wound of left leg, ball entering near the head of the tibia and emerging through the internal belly of the gastrocnemius muscle, producing lameness." The Boston Examining Board certified, October 27, 1865: "Has had wound of leg below knee, * * ball emerging one inch below and behind the internal condyle of the femur, evidently passing across the internal saphenous vein. Cicatrices not adherent, but there is some loss of substance of muscle, and the veins of the leg are varicose, probably in consequence of the wound. Motions of joint good. He says he has pain in leg on walking or standing, and much pain in popliteal space while sitting." On August 25, 1875, this pensioner came under the care of Dr. J. Collins Warren, at the Massachusetts General Hospital, who

[1] The other two cases of shot wounds of the popliteal artery are those of Pogue, 110th Ohio, who recovered and was discharged, and of Thompson, 120th New York, who died sixteen days after the reception of the injury.

reported the further progress of the case to the Boston Society for Medical Improvement, in the *Boston Medical and Surgical Journal*, Vol. XCV, No. 18, as follows: "Was wounded fourteen years ago, at the battle of Fredericksburg, by a musket ball, which entered the calf of the left leg a little to the inside, and came out opposite the inner aspect of the knee joint. There was no unusual amount of hæmorrhage at the time, and the wound healed well, but on recovery a small bunch remained in the popliteal space, growing larger at times, and again almost wholly disappearing. One year ago it grew larger than before and began to pulsate. It soon filled the hollow of the knee, and during the last two months has spread rapidly on the inside of the thigh. The skin over the popliteal space is made tense by an ill-defined pulsating mass, which spreads along the course of the femoral artery to within eleven inches of the anterior superior spinous process of the ilium. The left knee is nineteen inches in circumference, while the right knee measures but thirteen and one-fourth inches. The patient suffers severely from pain in the calf and foot, which is relieved only by frequent subcutaneous injections of morphine. A pound cannon-ball applied to the femoral diminishes but does not arrest pulsation in the vessel. Heavy pressure with the hand arrests pulsation entirely. August 30th: The patient was etherized and pulsation in the femoral was arrested by two hospital tourniquets applied, near the apex of Scarpa's triangle, alternately every fifteen minutes for twelve hours. During this period the patient was kept profoundly etherized, about a pound and a half of ether having been consumed for that purpose, with the exception of a few minutes during the afternoon, when some beef-tea and brandy were administered. The pulse during this time gradually rose from the normal rate to about 120, but subsided somewhat after nourishment had been taken. On removing the tourniquets pulsation had ceased, although on auscultation a slight murmur was heard beneath the tumor. At midnight there was no return of the pulsation, but the next morning a slight pulsation was observed, which gradually increased to its previous force. September 10th: Pressure was applied as before by tourniquet without ether, the patient preferring to bear the pain, and was continued for twenty hours, but had no effect upon the pulsations, which reappeared after it was removed. September 19th: The patient was etherized, the sac laid open, the clots, which were numerous, everted, and the artery tied at each end. It was found that the sac extended to the point of bifurcation of the popliteal artery. Two ligatures were therefore necessary at this point. The patient rallied well from the operation, and for the first week the wound healed rapidly. An attack of erysipelas arrested the healing process and reduced the patient greatly. On October 3d, hæmorrhage occurred from the upper end of the wound during the afternoon, and although digital pressure was immediately resorted to by an attendant, and in a few minutes the tourniquet was applied, the patient sank, and died the same evening. Dr. Fitz showed the specimen, which consisted of the aorta from its origin, the left femoral, and a portion of the aneurism in continuity. The fatal hæmorrhage had resulted from the sloughing of the walls of the artery at the upper end of the aneurismal sac, where the ligature had been applied. There was no alteration of the inner surface of the femoral artery, but the fibrous tissue was indurated around it, corresponding with the region where compression had been applied. The entire inner coat of the thoracic aorta was thickened, wrinkled, elevated in patches of an opaque grayish-white color, and the canal was dilated, especially that of the arch. Just above the cœliac axis these alterations ceased abruptly, the interior of the abdominal aorta being smooth and yellow, its walls evidently in a normal condition. The specimen was particularly interesting from the absence of changes at the point of compression and the presence of chronic inflammatory conditions of the thoracic aorta, such as are associated with the formation of aneurisms in a young man in whom a popliteal aneurism had arisen directly or indirectly from a traumatic cause."

Of five cases in which large veins were wounded, three in which the *femoral* vein was separately injured proved fatal, and two, in which the internal or long *saphenous* was believed to be lacerated, recovered. One of these is detailed:[1]

CASE 24.—Lieutenant L. D. Martin, Co. A, 29th Illinois, aged 32 years, was wounded through the left thigh at the siege of Fort Donelson, February 15, 1862. Dr. Madden, of Nashville, noted the following history of the case, which was forwarded by Surgeon E. Swift, U. S. A., Medical Director: "A rifle ball entered the limb at a point directly over the saphenous opening and glanced around upon the fascia lata to the outer aspect of the thigh, where it emerged one inch below the trochanter major. There was a copious flow of blood from the wounded veins at the time of the injury, but this was readily checked with lint. The patient was conveyed to the Academy Hospital at Nashville. On the eighth day there was a recurrence of venous hæmorrhage from the inguinal wound. This was again arrested by pressure, and the patient continued to improve till the evening of the 5th of March, when the bleeding was suddenly renewed to such a degree that the coats of the femoral artery were supposed to have yielded. Surgeon E. Swift, Medical Director in this city, having been consulted, he directed that the artery should not be ligated but judiciously compressed, and it was decided to postpone till the next morning any attempt to place a ligature upon the vessel. Pressure with the fingers upon the artery at the point of its emergence from beneath Poupart's ligament was maintained during the whole night by relays of assistants. Next morning, on intermission of the pressure, there was no hæmorrhage, nor was there any pulsation distinguished below the wound. A compress was placed over the artery, and a bandage applied from the toes to the groin. This was removed at the expiration of twelve hours, and the limb was wrapped in flannels. Pulsation below the groin was not perceptible for several days. The limb, however, retained its temperature and its vitality, and the circulation gradually became re-established. There was no recurrence of hæmorrhage. The patient recovered his strength rapidly, and returned to his home April 5, 1862, at which time he was able to walk with the assistance of a cane." Lieutenant Martin resigned the service September 17, 1862, and was pensioned. Examiner J. W. Redden, of Shawneetown, Illinois, March 1, 1864, certified: "The ball entered the front of the left thigh near the femoral artery, which seems to have been wounded; there is general derangement of the nerves affecting the joints, and muscular activity and strength of the limb." Examiner H. W. McCoy, of Golconda, Illinois, September 16, 1873, reported the pensioner as having received a "flesh wound of the left shoulder" in addition to the above injury, but no mention is made of this in any previous reports. The pensioner was paid June 4, 1876

[1] The three cases of injury of the femoral vein are: Scullen, 25th Ohio, who died of pyæmia on the 16th day; Bainbridge, 64th New York, fatal on the 23d day (for autopsy see Lincoln Hospital Case Book No. 17); and Schumaker, 2d New York Cavalry, who died on the eighth day after the reception of the injury. The other case of injury of the internal saphenous vein is that of Johnson, 7th Connecticut, who recovered and was discharged.

The result of this series of thirty-three shot wounds of the larger arteries and veins of the lower limb sufficiently prove that compression, styptics, or a let-alone practice cannot be safely adopted in such grave accidents. The histories of three fatal cases of wound of the femoral vein corroborates the argument of Surgeon S. W. Gross, U. S. V., in favor of the ligation of wounded venous trunks.[1] Surgeon J. A. Lidell, U. S. V., in his excellent memoir on traumatic hæmorrhage,[2] has cited two or three other instances of shot lesions of the great vessels of the thigh, reported by Surgeon W. Clendenin, U. S. V., of which I am unable to find any mention in the official returns. The comparative rarity of profuse primary bleeding from shot wounds of the large blood-vessels of the extremities can hardly be seriously contested.[3]

Wounds of Blood-vessels treated by Ligation.—Eighty-seven cases were reported of shot flesh wounds of the lower extremities with lesions of the larger blood-vessels, treated by primary or intermediary ligation of arteries. Only twenty-six of these resulted favorably, leaving the formidable mortality-rate of 70.1 per cent. Six cases in which the external iliac artery was tied for wound of the femoral or profunda, or of these vessels and their accompanying veins, were fatal. Of sixty-two ligations of the femoral but seventeen, or 27.4 per cent., were successful. One of two ligations of the profunda was successful. In seven ligations of the popliteal, two patients survived. There were two ligations of the anterior tibial with one recovery,—five of the posterior tibial with four recoveries,—two of both tibials with one recovery,—and one fatal case of ligation of the peroneal artery. All of these cases will be hereafter enumerated in brief abstracts or in tabular form; but, as there are many other cases of deligation of the same vessels in shot flesh wounds without primary arterial lesion, it will be most convenient to classify the analogous cases further on, and there will be presented here only a single abstract of a remarkable recovery after ligation of the femoral artery for shot injury:[3]

CASE 25.—Assistant Surgeon R. S. Vickery, 2d Michigan, aged 33 years, was wounded at Petersburg, July 30, 1864, and admitted to the field hospital of the 3d division, Ninth Corps. Surgeon P. A. O'Connell, U. S. V., reported: "Gunshot wound of upper third of left thigh by minié ball; ligation of femoral artery performed by Surgeon W. B. Fox, 8th Michigan." From the field hospital the patient was moved to City Point, and subsequently to New York. Assistant Surgeon J. E. Semple, U. S. V.. reported his admission to the Officers' Hospital, Bedloe's Island, August 25th, with "flesh wound involving direct injury to the large artery of the thigh." In January following, the invalid was transferred to Armory Square Hospital, Washington, where he was discharged from service March 11, 1865. Examiner J. Nichols, of Washington, certified, March 24, 1865: "Gunshot wound of left thigh, inner aspect, upper third, ball severing femoral artery. Limb much atrophied and shrunk away almost to the bone; leg partially flexed upon the thigh; inability to extend it. Great danger of secondary hæmorrhage from the artery, which requires a long time for restoration. Limb perfectly useless; prognosis doubtful—may yet have to be amputated." Dr. Vickery was a pensioner until May 14, 1867, when he was appointed Assistant Surgeon in the regular army.

---

[1] GROSS (S. W.), *Remarks upon the General Applicability of Ligation as a Venous Hemostatic Agent*, in *Am. Jour. Med. Sci.*, 1867, Vol. LIII, pp. 17, 305.

[2] In his paper on the *Wounds of Blood-vessels, Traumatic Hæmorrhage, Traumatic Aneurism, and Traumatic Gangrene*, in the *Surgical Memoirs of the Sanitary Commission*, 1870, Vol. I, p. 51, etc., Dr. JOHN A. LIDELL published several abstracts, contributed by Surgeon W. CLENDENIN, U. S.V., purporting to be descriptions of examples of "complete division of arteries by gunshot projectiles." Although these abstracts aptly illustrate the subject in hand, it has been found impracticable to verify the cases on the regimental and hospital returns; but in the confusion of the battle-field it is probable that not a few important surgical accidents failed to get recorded In the case of James Brown, 3d Tennessee Mounted Infantry (*loc. cit.*, p. 51), it appears that this regiment was never in action, and the patient's name is not on the hospital registers, nor does it appear on the death records. In the case of James O'Neal (*loc. cit.*, p. 55), it is left to conjecture whether the man belonged to the 10th Tennessee Mounted Infantry or to Wheeler's Cavalry. No reference to such a case is found on the files of the War Department. In the case of Sergeant French, 4th U. S. Cavalry (*loc. cit.*, p. 56), neither the date of the injury nor the engagement in which it was received are given, and on inquiry of the Adjutant General it has been ascertained that "there is no record of the enlistment of any soldier by the name of French in the 4th U. S. Cavalry, from 1856 to 1865, inclusive."

[3] BILLROTH (TH.) (*Chirurgische Briefe*, etc., Berlin, 1872, p. 113) remarks: "Of the immediate results of injuries of the larger blood-vessels, of profuse hæmorrhages on the field of battle, I have as little to relate as other surgeons that have served in the field. None of the colleagues with whom I conversed had observed such bleedings. Nowhere did I find a case of primary ligation of a large blood-vessel. It has been asserted that injuries of this kind prove fatal so rapidly on the battle-field that any assistance comes too late. There is no valid proof of this assertion. * * Observations are accumulating that arteries, even of the size of the aorta, when perforated by some modern shot projectiles, do not invariably bleed. In Carlsruhe, I have learned of a case *a priori* incredible, but attended by a careful autopsy, in which a shot through the aorta caused no bleeding until several days after the injury; the patient was therefore transported from Wörth to Carlsruhe with a hole in his aorta without any bleeding. I have, myself, seen three cases of shot wounds of the external iliac and femoral artery in which no bleeding occurred." Professor BILLROTH then details the cases.

Dr. F. H. Hamilton states (*Appendix to Treatise on Military Surgery and Hygiene*, 1865, p. 640) that in this case "the bleeding was arrested temporarily by a tourniquet, and three hours afterwards Surgeon Fox, of the 8th Michigan, enlarged the wound and tied the femoral *both above and below the seat* of injury."

No military surgeon now disputes the propriety of tying *both ends* of a bleeding artery at the wounded point,[1] and it is probable that if the judicious practice of Surgeon Fox had been more generally followed, and the precepts of Guthrie better appreciated, the deplorable fatality of this series of cases might have been largely averted.

Wounds of Blood-vessels treated by Amputation.—There were twenty-eight cases in which amputation was practised on account of uncontrollable bleeding from shot wounds of the larger blood-vessels of the lower extremity, and eight cases mentioned in the next subsection, in which recourse was had to amputation after proximal ligation of main arterial trunks had proved ineffectual. The series of twenty-eight cases includes twenty-six thigh amputations with only seven recoveries, a fatal amputation at the knee, and a fatal amputation in the leg. In this series the femoral artery was wounded in eleven instances, the profunda in one, the popliteal in nine, one of the tibials in six, and the long saphenous vein in one. All of these cases are tabulated further on. Details of two are inserted here:

CASE 26.—Corporal H. Schatt, Co. H, 64th New York, aged 30 years, was wounded at Hatcher's Run, March 25, 1865, and was admitted to the field hospital of the 1st division, Second Corps, where Surgeon F. M. Hammond, 126th New York, noted "a shot wound of the leg." On the following day the man was sent to City Point and thence to Washington. Assistant Surgeon H. Allen, U. S. A., reported his admission to Mount Pleasant Hospital April 2d, and contributed the following history: "Gunshot wound of left lower extremity, ball passing through popliteal space from without inward, injuring the popliteal artery. When admitted the patient's pulse was small, sharp, and fast; face pale and tongue coated. His toes were of a bluish tint, and the foot was covered with bluish and yellowish purple spots. The entire leg was greatly swollen and the superficial veins enlarged; the small veins of the lower third of the thigh, on the external surface, were somewhat discolored, and the integument was assuming a yellowish color. The limb was amputated at the lower third of the thigh, on the day of admission, by Acting Assistant Surgeon H. Craft. The operation was performed by the circular method, very little blood being lost. Two double ligatures were applied to the femoral and four to the branches. The anæsthetic consisted of equal parts of æther and chloroform. After the operation, cold-water dressings were applied, and a stimulating course adopted. The ligatures came away on the sixth and seventh days. On May 10th, there were symptoms of the femur exfoliating. The stump was nearly healed, when a collection of pus formed around the bone, and to give exit to it an incision was made just above the end of the stump. This was kept open by a tent and the stump encouraged to heal. Simple dressings were continued, and the tonic and stimulating course was persevered in. The exfoliating process steadily progressed up to June 19th, when a sequestrum was removed which proved to be nine inches long and was nearly a perfect shaft, extending nearly or quite to the trochanter major. It had only been partially destroyed on its under surface, and a new shaft of bone had formed around it. The stimulants and tonics were now increased, with nourishing diet, and by June 30th the patient was progressing favorably." The sequestrum was forwarded to the Army Medical Museum by Dr. Allen, and is represented in the annexed cut (FIG. 1). The patient was subsequently transferred to Rochester, and ultimately discharged from Ira Harris Hospital, Albany, September 25, 1865. Assistant Surgeon J. H. Armsby, U. S. V., contributed a cast of the stump (*Cat. Surg. Sect.*, 1866, p. 554), which shows the inferior portion to be baggy, and a deep and poorly healed cicatrix at that point, caused by loss of substance over the bone (FIG. 2). Examiner G. W. Cook, of Syracuse, N. Y., July 9, 1873, certified: "Tenderness of stump and slight covering over end of bone. He does not, nor can he, wear an artificial limb." The pensioner was paid June 4, 1876.

FIG. 1.—Cylindrical sequestrum from stump of left femur. *Spec.* 171. ½.

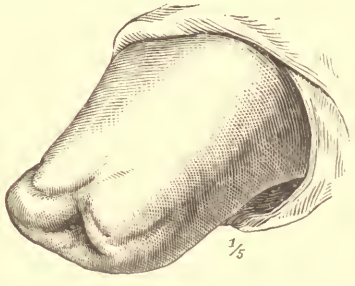

FIG. 2.—Stump after intermediary amputation of thigh. *Spec.* 2283.

Another case of this category is selected for illustration because it affords quite a typical example of what is likely to occur after a shot wound of the popliteal artery

[1] HEINE (C.) (*Die Schussverletzungen der unteren Extremitäten*, Berlin, 1866, p. 133), speaking of shot flesh wounds with injury of the arteries, remarks: "The ligation of the femoral artery was practised eight times [in the Danish War of 1864] and the external iliac was tied twice. In one of the latter cases, the femoral artery had been previously ligated; but as bleeding recurred, the external iliac was tied. This is the only case of the ten ligations that proved successful. * * The bleeding was primary in two cases only. * * In two other cases, no bleeding at all occurred, although the artery was completely severed in the wound; in the rest of the cases the bleeding was secondary,—from the seventh to the seventeenth day after the injury.

unless the proximal and distal ends of the vessel are promptly secured by ligature, and the formation of traumatic aneurism in the ham and consequent gangrene of the leg prevented. Moreover, in this instance, the patient having been brought to Washington, a very conscientious artist was able to depict the appearance of the gangrenous limb, in a water-color drawing, which is reproduced with tolerable accuracy in the chromolithograph opposite:

CASE 27.—Sergeant G. W. Gardner, Co. A, 12th Illinois Cavalry, aged 29 years, was wounded at Mitchell's Ford, on the Rappahannock, October 11, 1863. Surgeon S. B. Wylie Mitchell, 8th Pennsylvania Cavalry, reported that he was struck by a conoidal carbine ball, which entered four inches above the right knee, passed through the inner hamstring muscles and the adductor magnus, outward and downward, and lodged under the integument on the outer side of the thigh. Upon extracting the ball through an incision there was a profuse hæmorrhage, which ceased spontaneously. The patient was sent by railway to Washington, and entered Emory Hospital on October 13th. Acting Assistant Surgeon J. Walsh reported that "he was feeble and pallid; no pulsation could be detected in the tibial arteries of the injured limb. There was loss of sensibility and slight discoloration of the skin of the right foot. The leg was packed in raw cotton, and the temperature was kept up by bottles of hot water. Frictions with a stimulating liniment were occasionally employed. After October 18th, the leg was daily immersed in a bath of oxygen gas. On October 25th, two bits of blue cloth and a small piece of white cotton cloth were extracted from the wound. The foot was decidedly gangrenous, and gangrene began to advance rapidly up the leg." At this time a sketch of the appearances of the limb was made, under Surgeon J. H. Brinton's direction, by Hospital Steward E. Stauch. This drawing was elaborated, after the lamented death of Mr. Stauch, by Hospital Steward Schultze, and has been reproduced by chromolithography in the plate opposite (PLATE I, 28). On October 29th, Acting Assistant Surgeon W. H. Ensign amputated the limb at the lower third of the thigh. On examination of the amputated member it was found that the artery had been completely divided by the ball near the point at which it passes through the opening in the great adductor. The divided extremities of the artery were occluded by dark grumous clots. After the operation the patient was attacked by diarrhœa, and, on December 5, 1863, the case terminated fatally. A wet preparation of the lower half of the right femur, with a portion of the soft tissues, including the popliteal artery and vein, was contributed to the Army Medical Museum by Acting Assistant Surgeon J. Walsh (*Cat. Surg. Sect.*, 1866, p. 521), and is represented in the adjacent wood-cut (FIG. 3).

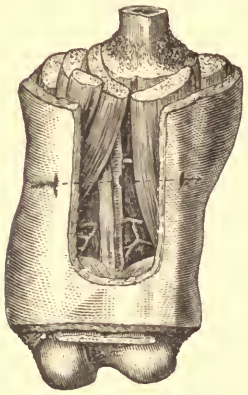

FIG. 3. — Preparation of lower half of the right thigh, showing a shot laceration of the popliteal artery. *Spec.* 1760.

Wounds of Blood-vessels treated by Ligation and subsequent Amputation.—Of the eight instances in which consecutive amputation was had recourse to after the failure of proximal ligation of large arteries for primary bleeding, six succeeded ligation of the femoral, one ligation of the popliteal, and one ligation of the posterior tibial. Five were amputations in the thigh, and three of the leg. Only one of the eight patients recovered, a case of wound of the popliteal artery treated by tying the femoral and subsequently amputating at middle thigh. One of the fatal cases is detailed:

CASE 28.—Corporal J. M. Harris, Co. E, 14th Iowa, aged 20 years, was wounded in the right thigh at the battle of Tupelo, July 15, 1864, and entered the Adams Hospital, Memphis, five days afterwards. Assistant Surgeon J. M. Study, U. S. V., made the following report: "A minié ball entered the lower portion of the middle of the thigh and passed beneath the bone without fracturing it. Aneurism of the femoral artery resulted. On July 27th, Surgeon J. G. Keenon, U. S. V., probed the sac with the finger, when excessive hæmorrhage ensued, and, after great difficulty in finding the ends of the artery, the vessel was ligated above and below the sac. Acting Assistant Surgeon S. S. Jessup assisted at the operation. Sphacelus of the foot and leg afterward necessitated amputation, which was performed, just below the knee joint, by Acting Assistant Surgeon R. W. Coale. The patient died of pyæmia August 3, 1864."

Recurrent hæmorrhage from the lower end of the wounded vessel was what commonly necessitated amputation in these cases.

Flesh Wounds of the Lower Limbs unattended by Primary Injury of the Large Nerves or Blood-vessels.—While in the two hundred and fifteen cases discussed in the two foregoing subsections, direct shot injury of the larger blood-vessels or nerves was regarded as the paramount lesion distinctively characterizing them, there were many other instances in the immense category of recorded shot flesh wounds of the lower extremities where the nerves and vessels shared in the laceration of the muscular and other soft parts by large projectiles, or were indirectly involved in the morbid processes following penetra-

ting or perforating wounds by small missiles. These are included in this third subsection of shot flesh wounds of the lower extremities, a group of fifty-eight thousand four hundred and eighty-seven reported cases, which (as stated on page 8) it is difficult to classify. Some instances remarkable for the extent of laceration of the soft parts will be cited, some of lodgement of foreign bodies, and some distinguished by the complications of pyæmia, tetanus, gangrene, erysipelas, hæmorrhage, secondary involvement of joints, etc., will be adverted to. In a hundred cases, ligation of the larger arterial trunks was resorted to, and in a hundred and sixty-one recourse was had to amputation. It will be recollected that in the two preceding subsections ninety-five examples of ligations and forty of amputations have been alluded to, as connected with primary injury of the nerves or vessels. All of these cases of ligations and amputations will be cited in consolidated tabulations at the close of this section. Some cases of shot wounds of the lower limbs, in which no operative interference was undertaken, will now be detailed.

Shot Lacerations.—After extensive destruction of the fleshy parts of the thigh and leg, reparation was usually slow and imperfect, sometimes as much so as in the remarkable case of laceration of the buttocks, narrated at page 430 of the *Second Surgical Volume.* Practitioners accustomed to regard mere flesh wounds as of little moment were not always happy in their prognoses of shot injuries of the soft parts in the lower limbs.[1]

CASE 29.—Sergeant J. W. White, Co. F, 14th New Jersey, aged 24 years, was wounded at Monocacy, July 9, 1864, and admitted to hospital at Frederick on the following day. Acting Assistant Surgeon J. H. Bartholf reported: "The patient was wounded by a cannon ball, or, as he says, by an unexploded shell, which tore through the back of his left thigh and killed a man close by him. It produced a very extensive lacerated wound, extending on the back of his thigh from near his knee to the fold of his buttock—a huge flap hanging downward and a shorter one attached at the upper end of the wound. He was admitted here the next day, without then suffering from any shock. Free suppuration followed, but not any sloughing, and simple measures only were required, viz: poultices, dilute solution of permanganate of potash, balsam of peru, water dressings, oakum, simple cerate. It granulated, contracted, and healed till, on November 25th, the raw surface was only four inches square. No loss of motion at the knee joint, strange to say, resulted from this extensive involvement of the muscles. December 22d, he is transferred to hospital at Beverly this day. The wound is very nearly healed, and the patient in good health." Subsequently the man was transferred to the Whitehall Hospital, whence he was discharged June 17, 1865, and pensioned. The Trenton Examining Board certified, September 4, 1873: "The muscles of the posterior portion of the left thigh were very badly lacerated by a fragment of a shell; all the flexor muscles were torn through and a most persistent and gangrenous sore followed the wound, and the cicatrix is very large and tender, the leg weakened, so that he cannot walk far or stand long on it." The pensioner was paid June 4, 1876.

Even in young and healthy subjects the progress of repair was slow after large solutions of continuity:

CASE 30.—Corporal A. W. McCausland, Co. B, 16th Maine, aged 18 years, was wounded at Gettysburg, July 2, 1863, and admitted to the field hospital of the First Corps. On August 24th he was transferred to Camp Letterman, where he came under the care of Assistant Surgeon W. F. Richardson, C. S. A., who recorded: "A shell struck the outer side of the left thigh, inflicting a terrible flesh wound eight inches long by four in width, with ragged edges. When admitted the patient was in good health, the wound looking well and filling up with healthy granulations. Up to date the treatment has been cold-water dressings. Stimulants are given and simple cerate dressings now used. The patient improved rapidly, and the wound closed." In October the man was transferred to Satterlee Hospital, Philadelphia, and on January 10, 1864, he was discharged from service by reason of "lameness of left leg resulting from the wound." Examiner T. Hildreth certified, September 4, 1873: "Was wounded by a shell in the posterior part of the thigh, carrying away a very large part of the muscles and integument, resulting in a tender cicatrix. He now suffers from numbness of the limb." The pensioner was paid June 4, 1876.

Sometimes small projectiles produced extended lacerations by driving into the soft parts coins,[2] knives, or other hard objects carried in the pockets of the soldiers:

CASE 31.—Private J. C. Haggerty, Co. I, 124th New York, aged 21 years, was wounded at Chancellorsville, May 3, 1863. Surgeon J. S. Jamison, 86th New York, noted a "shot wound of the right thigh." The patient passed from a Third

[1] Dr. C. HEINE (*Die Schussverletzungen der unteren Extremitäten*, Berlin, 1866, p. 65) thinks that large shot lacerations of the fleshy parts of the lower extremities are peculiarly liable to be followed by tetanus; but I find in the records under discussion little to corroborate this view. I will revert to the subject in treating of *Tetanus*.

[2] SOCIN (A.) (*Kriegschir. Erf.*, Leipzig, 1872, p. 16) gives a drawing of a flattened *Langblei* (the missile of the needle-gun), together with three bent French copper sous pieces and two vest buttons, all of which were extracted from the thigh of a French soldier at the Swiss ambulance at Lure. The ball and the large copper coins were detected and removed soon after the reception of the injury, but the buttons were not extracted until three months afterwards.

Corps hospital to Fairfax Seminary, and thence to Satterlee Hospital, when Acting Assistant Surgeon I. Roberts reported the case as interesting, inasmuch as the ball struck a silver coin in the right pocket of the man's trousers and was thus deflected from the track of the femoral vessels; but passed through the soft parts, driving fragments of the pocket-book into the tissues, and escaping at the gluteal fold. The wound progressed favorably for a time, but, about July 20th, deep abscesses formed, and there was some sloughing at the aperture of entrance and exit. The abscesses were incised, and several fragments of the pocket-book came away with the pus. There was so much constitutional irritation that quinia and stimulants were freely exhibited. The wound healed about the middle of December, and the man was transferred to the Veteran Reserves. He was quite lame, and the right foot was much everted. He was discharged October 7, 1864, and pensioned. Examiner J. Nichols, of Washington, certified: "Ball entered anterior aspect of upper third of right thigh, passing directly through, and inflicting a frightful flesh-wound. Bone uninjured; cicatrix very deep and adherent to all the soft parts below, nearly to the bone, rendering free motion of the limb impossible, and, if much used, very painful." Examiner J. Gordon, of Newburgh, New York, reported, February 28, 1876: * * "There remains a large umbilicated cavity, with adhesions of skin, fascia, and muscles. He suffers more particularly from distress in the leg, extending in part to the foot, accompanied, before atmospheric changes, with shooting, darting pains, * * so severe at times as to unfit him for manual labor." This pensioner was paid June 4, 1876.

Extensive lacerations of the calf were very slow in healing, and usually resulted in adherent cicatrices with atrophy of the remaining muscular tissues, greatly disabling the functions of the leg and foot:

CASE 32.—Sergeant F. A. Ingerson, Co. K, 27th Massachusetts, was wounded at New Berne, March 14, 1862. Surgeon G. A. Otis, 27th Massachusetts, reported that "a large fragment of shell striking the calf of the left leg carried away the greater portion of the bellies of the gastrocnemius and soleus muscles. There was inconsiderable bleeding. The laceration was so very extensive that it was difficult to coaptate or adjust the wound, and much of it had to be dressed open." The patient was sent to Academy Green Hospital. After the separation of sloughs, there remained a huge granulating surface. On April 19th, the patient was sent to a northern hospital, and discharged December 19, 1862. Examiner A. Lambert, of Springfield, reported, March 11, 1863, the wound "unhealed and discharging constantly." The Boston Examining Board stated, March 23, 1870: "A fragment of shell engaged the left calf. During the suppurating process that ensued a considerable portion of the belly of the calf was lost. *The wound has not entirely closed,* and the injured leg is notably larger than the other." In October, 1875, Examiner A. W. Nelson, of New London, reported: "There is a large cicatrix of left calf, with loss of most of the substance of the gastrocnemius; * * patient unable to walk a long distance."

In a similar case, amputation was contemplated; but the patient ultimately made a satisfactory recovery without operative interference:

CASE 33.—Private P. C. Whidden, Co. B, 13th Massachusetts, aged 22 years, was wounded at Antietam, September 17, 1862, and entered the Mason Hospital, Boston, January 22, 1863. Acting Assistant Surgeon W. E. Townsend noted: "Shot wound of left leg. Patient returned to duty November 1, 1863." The following detailed account of his injury and its result was forwarded by the man in July, 1866, through Dr. H. I. Bowditch, of Boston: "Was struck by a piece of shell on the posterior aspect of the left leg, causing extensive laceration and loss of the soft tissues, without injury to the bone. The wound extended from just above the ankle joint about eight inches up the back of the leg, from which, within these bounds, the soft parts, integuments, tendons, muscles, both arteries, and the posterior tibial nerve were entirely carried away, exposing the bones through nearly the whole length of the wound. On the front of the leg, corresponding to the middle of the wound, but about an inch of sound skin was left. A rounded flap, about an inch and a half long, containing the lower portion of the tendo-achilles, was torn up and laid back over the heel. The upper part of the wound was ragged and contused, and the middle portion cleanly cut away. There was but little hæmorrhage. He walked with great difficulty to the rear, and was then carried to a house a short distance from the field, where a consultation as to the propriety of amputation was held, six surgeons being present. Four decided that amputation was necessary to preserve life; one assented to this under existing circumstances, but thought that under more favorable conditions there was a possibility of recovery without the operation; the other that amputation was uncalled for. The patient decided to retain the limb. The wound was dressed with lint and was not disturbed for five days. On the fifth day, he was carried in an ambulance a distance of twelve miles to the hospital in Hagerstown. Upon examination the wound was suppurating profusely and full of maggots, and it was dressed with yeast poultice and powdered charcoal. It was then determined to amputate, but the operation was postponed for three days, and nourishing diet and stimulants were ordered. On the fourth day an examination preliminary to the operation was made, when healthy granulations appeared along the edges of the bones, and the operation was abandoned. The patient was then carried to a private house, where he received proper nourishment and good nursing, and at the end of a month, no bleeding having at any time occurred, went to his home in Boston Granulations had been going on rapidly; the wound had been filling up without a sign of inflammation, and a pellicle was spreading out from the sound skin all around the borders of the wound. After the journey the parts became irritated and inflamed, and the process of cicatrization went on much more slowly. By the first of March following the parts were perfectly healed, and the patient walked about with the aid of a cane. But the pellicle covering the surface being excessively thin was easily abraded, and the newly formed tissues possessing but little vitality, it healed slowly, new portions being rubbed off before the old were renewed, so that at no time since the wound was first closed has it been entirely free from slight superficial ulceration. At the present time the gap is partially filled up with cicatricial tissue, which has undergone contraction, making the wound appear much smaller than it originally was. It is covered with a thin layer of epithelium which constantly desquamates. The flap torn up and laid over the heel, as referred to above, instead of presenting the narrow outline of the tendo-achilles, has, in healing, become a thick flabby mass beneath the cicatrix, and after long walking becomes œdematous. The length of the cicatrix from top to bottom, on each side of the flap, is seven inches in the median line; from the top

of the cicatrix to the edge of the flap five inches; across the widest part at top and bottom, three and a half inches; in the middle, the narrowest part, three inches. Four inches and a half above the malleoli the leg measures in circumference six and a half inches; the sound leg at the corresponding part, nine inches. The integument on the front of the leg, at its narrowest part, is three and a half inches in breadth. The muscles of the calf contract but exert no influence over the foot, the tendons being absent, and extension cannot be performed, but the foot drops with its own weight. Owing to contraction of the cicatrix the foot can be flexed to but little less than a right angle with the leg. Sensation, which was lost in the external border of the foot and heel, has gradually returned. There is slight obstruction to the circulation from the slow return of venous blood. The patient walks with ease, unaided by a cane, and without the slightest perceptible limp." The report of the Adjutant General of Massachusetts shows that Private Whidden was discharged from service, by order of the War Department, December 11, 1863. He is not a pensioner.

In extensive lacerations of the soft tissues of the thigh and leg by shell fragments, or other large projectiles, it was often difficult to make out the exact extent of the injuries inflicted, and the field returns of the surgeons who examined the primary wounds, and the later reports of the hospital surgeons and pension examiners were often, of necessity, wanting in precision regarding such lesions.[1]

Lodgement of Missiles.—A few cases of lodgement of projectiles or of foreign bodies driven by them into the soft parts of the lower limbs will be cited:[2]

CASE 34.—Private W. H. King, Co. E, 17th Maine, aged 24 years, was wounded at Bartlett's Mill, November 27, 1863, and admitted to Prince Street Hospital, Alexandria, one week afterwards. Acting Assistant Surgeon J. Cass contributed the specimen (FIG. 4), with the following history: "He was wounded by a musket ball which struck two pocket knives, breaking them and driving the fragments with the ball into the anterior side of the middle third of the left thigh. A hundred fragments of the knives and four of the ball were removed on the field. Lime-water dressings applied to the wound, and fifteen drops of tincture of iron given before meals. On December 13th, he suffered considerable pain in the wound, and on the following day an incision was made two and a half inches from the wound, and a jagged piece of ball an inch long and three-fourths of an inch wide was extracted. 16th, complained of strangury and some pain in the limb. A teaspoonful of spirits of nitre given three times a day. 17th, was restless during the night; sweats profusely, and had a chill this morning. Gave morphia and whiskey, also half an ounce of castor-oil. Has had no stool for forty-eight hours; pulse 115 and feeble; tongue coated; very thirsty; some soreness in inguinal glands. Prescribed extract of ginger and turpentine ten drops each, to be repeated in six hours if it does not operate, and gave tonics and stimulants. 18th, pulse 100, tongue moist and coated. Sweats all the time, and vomited in the night. Bowels moved freely and urinates more freely; appetite better. There is a greater discharge of pus from the wound. 19th, pulse 115 and feeble; vomited considerable during the day. Ordered two quinine pills to be taken before meals, and an anodyne injection at bedtime. 20th, about the same; had a chill yesterday; granulations are pale and flabby. 21st, pulse 140 and very feeble; great prostration; had a chill this morning and is delirious. Takes stimulants every hour. 22d, rested well, but is more prostrated and shows tendency to coma. Died at 4.30 P. M. Autopsy eighteen hours after death: On cutting through the muscles of the thigh, an inch and a half from the surface and an inch from the main channel of the wound, a sliver of horn from a knife-handle was found, half an inch long and one-sixteenth of an inch wide; also a brass rivet one-sixteenth of an inch in diameter and one-fourth of an inch long. In another place two pieces of horn from the other knife-handle, one three-eighths of an inch long and one-fourth wide, and the other one-eighth each way, were found; also a piece of a blade one-fourth of an inch long and one-eighth wide; and two pieces of brass, one being three-eighths of an inch long and one-sixteenth wide at one end and tapering to a sharp point at the other, and the other piece measuring one-eighth of an inch each way. Opposite the external wound the periosteum was found in places thickened, inflamed, jagged, discolored, slightly ossified, and separated from the bone for the space of two and a quarter inches longitudinally, and one inch transversely, with some pus beneath it." Dr. Cass

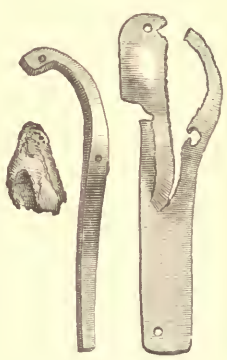

FIG. 4.—Fragments of ball and pocket knife extracted from thigh. *Spec.* 3236.

[1] CHENU (J. C.) (*Aperçu hist. stat. et clin., etc., pendant la guerre de* 1870–71, T. I, p. 283) observes: "*L'éclat de bombe ou d'obus* cause le plus souvent de *larges plaies avec perte de substance.* Nous connaissons quatre faits dans lesquels la partie antéro-interne des téguments de la cuisse fut enlevée d'un seul coup sans lésion de l'artère fémorale; on voyait les battements du vaisseau au fond de la plaie." The same surgical annalist cites a case, in which disarticulation at the hip joint was performed *in extremis* by M. MAURICE RAYNAUD on a soldier of the National Guard, aged 19, with a terrible flesh wound of the thigh.

[2] Among interesting published cases of lodgement of shot projectiles in the thigh is that of Major R. H. Stephenson, 24th Massachusetts, described by the late J. MASON WARREN (*Surgical Observations, with Cases and Operations*, 1867, p. 546): A musket ball, entering the front of the left thigh, about two inches below Poupart's ligament, was concealed somewhere beneath the rectus, and eluded the researches of a number of experienced surgeons. WARREN, after ineffectually searching for the ball a month after the injury, advised that the patient should use the limb with a view that muscular action would bring the ball from its hiding place. This prevision was justified, and a fortnight afterwards the position of the ball was recognized, and WARREN cut down and extracted it, and the officer speedily rejoined his regiment. The same writer has related (*Boston Med. and Surg. Jour.*, 1862, Vol. LXVI, p. 473) the case of Lieutenant C——, 2d Massachusetts, wounded in the retreat from Winchester, a musket ball making a long track in the gastrocnemius, and carrying before it, like a glove-finger, a patch of trousers and flannel underclothing, making a huge plug, which could only be removed the following day by free incisions. Dr. M. GOLDSMITH, of Rutland, Vermont, formerly Surgeon U. S. V., has described (*The Search for Balls in old Gunshot Wounds*, in *New York Med. Jour.*, 1868, Vol. VI, p. 426) the case of a color-bearer of a Vermont regiment, in which a ball deeply buried in the thigh was reached by dilating the sinus leading to it by sponge-tents.

also contributed five inches of the shaft of the femur of the injured thigh, which constitutes specimen 1985 of the Surgical Section of the Army Medical Museum. It is sawn longitudinally, and shows the shaft to be denser than usual and apparently somewhat hypertrophied. (See *Cat. Surg. Sect.*, 1866, pp. 258, 617.)

There were several cases in which large missiles buried in the fleshy parts escaped recognition; but none have been observed in which such concealed foreign bodies equalled in magnitude the projectiles that have been cited in some works on military surgery as embedded in the great muscles of the lower limb:[1]

CASE 35.—Lieutenant L. Soistman, Co. H, 98th Pennsylvania, aged 23 years, was wounded at Salem Heights, May 3, 1863. Three days afterwards he entered the Campbell Hospital, Washington, where he obtained a leave of absence on May 19th. On July 8th, he was admitted to the Officers' Hospital, Philadelphia, where Acting Assistant Surgeon W. Cammac recorded the following history: "A piece of shell entered the right thigh at the most depending inner part of the middle of the upper third, went under the deep fascia, and upward under the femoral artery and buried itself. The missile appears not to have been noticed at first, as the wound was sewed up. After going to his home in Philadelphia he was attended by a private physician, but the missile remained still undiscovered. On July 8th, Acting Assistant Surgeon W. Hunt was called in, who was struck by the peculiar feel, and on introducing a probe immediately found the foreign body, and ordered the patient to the hospital to have it removed. On July 9th, Dr. Hunt enlarged the wound, and, after considerable trouble from the proximity of the large vessels, removed, with the assistance of the forceps, a piece of shell weighing nine ounces, which had lodged in the thigh sixty-six days. Its presence had given rise to no great disorganization, but he complained, he says, of a weight in the part during the whole time. After recovery from the effects of the ether, a half grain of sulphate of morphia was given. Cerate dressings and light pressure were applied, and the wound drawn together with adhesive straps. The patient's general health was excellent. He did remarkably well and felt greatly relieved by the operation. On July 13th, cataplasms were ordered, the wound looking well and suppurating moderately, and the patient having better appetite than any time since wounded. On September 5th he was attacked with intermittent fever, which was checked after several days by quinine. By October 1st the wound had nearly healed, but the leg was still weak from extensive disorganization of the great muscles of the thigh. On November 9, 1863, he was returned to duty." This officer was again wounded, at the battle of the Wilderness, May 5, 1864, in the right side, for which injury he was treated in hospitals at Philadelphia and Annapolis. On August 2, 1864, he was again returned to duty, and on October 13, 1864, he was mustered out of service. The Philadelphia Examining Board certified, October 19, 1870: * * "A deep flesh wound, which, in healing, caused a cicatrix about five inches long and four inches wide, with loss of portion of muscular tissue, causing partial loss of power in the limb upon making much exertion," etc. The pensioner was paid March 4, 1876.

Sometimes musket balls buried themselves in the muscular parts of the lower limbs after ricochetting from stony or metallic surfaces:

CASE 36.—Private A. Wegner, Co. A, 16th Michigan, aged 25 years, was wounded at Gaines's Mill, June 27, 1862. Surgeon P. B. Goddard, U. S. V., contributed the specimen (FIG. 5), and reported: "He was wounded in the right hip by a shell and ball, taken prisoner June 30th, and carried to Richmond; paroled July 25th, and arrived at Sixth and Master Streets Hospital, Philadelphia, July 30th. This ball ricochetted from a stone or some hard substance, entered the front of the thigh near the femoral artery, and was cut out at the gluteus maximus muscle four inches higher up than the orifice of entrance. It did not touch the bone, but carried in with it a long strip of trousers." The patient was discharged January 26, 1863, and pensioned. In the certificate of disability Surgeon Goddard stated that "the ball wounded the sciatic nerve." Examiner R. G. Jennings, of Little Rock, certified, September 5, 1873: * * "One ball entered the right hip near the joint, glanced, and was cut out from the gluteal muscles. The wound occasionally discharges pus. Suffers from frequent pain in the joint. The leg remains weak and of comparatively little service to him, as he is unable to walk or stand long upon it." In January, 1876, the same examiner reported: "Has periodical discharges of pus and spiculæ of bone. The sensation of the right leg is much impaired and the motion impeded by partial paralysis," etc. The pensioner was paid June 4, 1876.

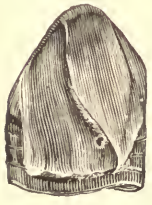

FIG. 5.—Distorted conoidal ball removed from the thigh. *Spec.* 4472.

[1] HENNEN (*Principles of Mil. Surgery*, 3d ed., 1829, p. 79) has recorded several examples of the lodgement of large projectiles in the thigh. He remarks that: "Masses of very extraordinary and almost incredible sizes are found. . . I have frequently seen them," he says, "of one and sometimes two pounds weight." He then cites the case of Lieutenant F——, 12th Regiment, wounded at Seringapatam. A cannon shot rolled over the banquet behind which this officer was lying down, and buried itself in the muscles of the hip. The bearers who conveyed him on a dooley to the tent of the chief medical officer, Dr. ALEXANDER ANDERSON, complained of the difficulty of carrying him from the trenches, owing to the litter "*having been unusually heavy on one side.*" The officer was moribund on his arrival; but, after his death, Dr. ANDERSON cut out what he told Dr. HENNEN was "unequivocally a thirty-two pound shot." GUTHRIE (*Treatise on Gunshot Wounds*, 1871, p. 72) relates the case of a soldier at Badajos, with a large piece of shell lodged in the thigh and buttock. HENNEN says (*loc. cit.*, p. 79) that the projectile weighed *eight pounds*. It was removed, and the man recovered. LARREY (*Mém. de Chir. Mil.*, 1812, T. III, p. 582) describes a case in which he removed a ball weighing *five pounds* from the thigh of a soldier. It had caused him little inconvenience, except a feeling of weight in the limb. PAILLARD (*Rélation chir. du siege d'anvers*) mentions that BÉGIN told him of a case in which a *nine-pound* shot was embedded in the muscles of the thigh. Dr. G. M. B. MACLEOD (*Notes on the Surgery of the War in the Crimea*, 5th ed., p. 108) states that he "saw a case at Scutari, in which a piece of shell weighing nearly three pounds was extracted from the hip of a man wounded at the Alma, which had been overlooked for two months, and to which but a small opening led." He further relates that BAUDENS describes the case of a French soldier in the Crimea, in which a shell fragment weighing 2 kilog. 150 grammes, or about five and three-quarters pounds avoirdupois, buried itself in the thigh so as to be invisible. I have not found this case in the *Guerre de Crimée* of BAUDENS, or in his letters of that date to the *Gazette Médicale*. A surgeon of a Maine regiment told me of a twelve-pound solid shot, that he had extracted from the muscles of the thigh of a volunteer soldier at Portland, which he should send to the Museum; but the missile never arrived, nor could the injury referred to be identified on the surgical records.

The small iron balls from spherical case-shot, having only a slight velocity at a little distance from the point of explosion, often lodged:

CASE 37.—Private E. E. Middleton, Co. C, 12th New Jersey, aged 24 years, was wounded at Gettysburg, July 3, 1863, and admitted to Newton University Hospital, Baltimore, several days afterwards. Surgeon C. W. Jones, U. S. V., reported: "The patient was in good condition when admitted. A ball entered near the posterior border of the tibialis anticus, a little above the middle third of the left leg, and, passing downward and backward, was removed July 13th, from the posterior portion of the leg by a counter-opening about four inches below the point of entrance. The missile on being removed proved to be a round ball from a spherical case shot. The wound has healed well and rapidly, but the contraction of the muscles makes the man look as if he had talipes equinus. However, the contraction is growing less by passive motion, and there is reason to hope that he will soon have perfect use of the limb. Simple dressings were used all the time." The missile was contributed to the Museum by Surgeon Jones, and is represented in the cut (FIG. 6). On February 2, 1864, the patient was transferred to Patterson Park Hospital, and one week afterwards he was returned to his command for duty. On June 4, 1865, he was mustered out of service. In his application for pension he alleged that "the wound healed, but broke out afresh in the spring of 1865, and discharged pieces of bone." Examiner B. H. Stratton, of Masonville, N. J., September 4, 1873, reported the leg as being in an ulcerated condition from necrosis of bone. Examiner F. Ashurst, of Mount Holly, certified, September 18, 1875: * * "The cicatrices are healed, and the pensioner enjoys very good health." This pensioner was paid June 4, 1876.

FIG. 6.—Iron case-shot extracted from the thigh. *Spec.* 3199.

In the next case, a musket ball had remained, innocuously, for more than two years, encysted near the outer hamstring tendons, and was not removed until the patient underwent amputation in the thigh on account of a complicated fracture of the leg. The cyst is of dense connective tissue.[1]

CASE 38.—Sergeant H. M. Lambert, Co. D, 12th Illinois Cavalry, aged 29 years, sustained a contusion of the right leg by the falling of his horse during a charge on the enemy near Germanna Ford, October 10, 1863. Three days after the accident he was admitted to Emory Hospital, Washington, whence Surgeon N. R. Moseley, U. S. V., contributed the specimen (FIG. 7), with the following report: "Slightly comminuted fracture of both bones of right leg at middle third, followed by copious discharge of sanious pus. The patient having become weak and debilitated, tonics and stimulants were resorted to with the desired effect. On October 25th, double-flap amputation at the upper third of the leg was performed by Acting Assistant Surgeon W. H. Ensign. Simple dressings and adhesive straps were used. The patient did well, and the stump had almost entirely healed, when, on November 8th, hæmorrhage supervened. Graduated compresses were resorted to without avail, and on November 10th the limb was reamputated at the lower third of the thigh by the double-flap method. The stump was again well-nigh healed, when, on November 26th, hæmorrhage again set in, and Dr. Mott's tourniquet was applied with perfect success. On December 10th the tourniquet was removed, and no return of the hæmorrhage followed. By January 18, 1864, the patient was up and about the ward, and doing well. The specimen, a conical ball enclosed in a sac, was removed from the amputated leg at the second operation. The patient had received this ball in a skirmish with the enemy in Kentucky, in October, 1861, and the missile had remained in the popliteal space beneath the outer hamstring tendons, without inconvenience, for two years and one month." The amputated tibia and fibula, showing no attempt at union, were contributed by the operator (See *Cat. Surg. Sect.*, 1866, p. 511), and constitute specimen 1744 of the Surgical Section of the Army Medical Museum. The patient was subsequently transferred to Judiciary Square Hospital, and discharged from service July 30, 1864. He is a pensioner, and was paid June 4, 1876.

FIG. 7.—Ball encysted in connective tissue. *Sp.* 1879.

There were cases in which missiles gravitated for considerable distances from the point at which they at first lodged:

CASE 39.—Private A. J. Dougherty, Co. I, 13th Indiana, aged 19 years, was wounded in the thighs at Turkey Bone Bridge, November 2, 1861. After being treated for a time at the regimental hospital he was returned to his company for duty, and subsequently he received a furlough to visit his home in Philadelphia. Acting Assistant Surgeon H. M. Bellows reported the following history: "He was admitted to Broad and Cherry Streets Hospital, April 13, 1863, at which time a foreign body was discovered beneath the skin on the front of the right thigh, five inches above the patella, which gave rise to considerable pain whenever the patient walked. On the next day it was removed by Surgeon J. Neill, U. S. V., and proved to be the half of a round leaden ball. He stated that the missile entered the left thigh just below and in front of the trochanter, where the only visible scar was found. After the injury he had some pain and tenderness on pressure over the lower part of the abdomen, with difficult micturition for a few days. On examination the presumption was that the fragment must have crossed from left to right, either in front or just above the pubes, and thence gradually downward into the thigh. The wound healed by granulations and by the 5th of May had completely cicatrized." The missile was contributed to the Museum by the operator, and constitutes specimen 1776 of the Surgical Section. The patient was subsequently transferred to Indiana, and mustered out at the expiration of his term of service, June 19, 1864. He afterward again enlisted, and was finally discharged June 21, 1865,

[1] At the points *a a* the ball is uncovered by the cyst; but the cellular envelope was probably nicked by the scalpel in cutting out the ball. This is one of the few good examples the Museum possesses of the "*Kyste définitif*" surrounding balls as defined by BAUDENS (*La Guerre de Crimée*, 2ème éd., 1858, p. 119). This "*Kyste primitif*," which he claimed to have "peremptorily demonstrated" to always invest balls embedded in the muscular tissues, even when extracted immediately after the infliction of injury, has not been observed by others (See MACLEOD, *Notes, etc., op. cit.*, p. 109), and doubtless means nothing more than that missiles sometimes get an investment from the intramuscular areolar tissue.

and pensioned. Examiner E. A. Smith, of Philadelphia, August 28, 1865, certified: * * "Pain in right testicle, and left leg feels perfectly dead at times; walks with difficulty." The Philadelphia Examining Board reported, February, 18, 1874: * * "Complains of pain in both limbs. Alleges that he has difficulty in passing water at times from irritable condition of bladder, and pain in the whole course of the ball. Cicatrices are without adhesions to the bone, and there is no atrophy of the limb. Slight stiffness about the left hip joint." This pensioner was paid June 4, 1876.

As in Chapter XI the peculiarities of shot wounds in general will be discussed, it would be superfluous here to dwell longer on the particular instances of missiles lodged in the fleshy parts of the lower limbs.[1] While not wishing to be rudely incredulous in regard to the almost marvellous accounts that some authors have given of large projectiles embedded in the soft parts of the thigh and leg, I may say that analogous authenticated examples are not to be found in the experience of the American War, and that in most of the remarkable heretofore recorded cases there is reason to believe that they were probably associated with fractures.

Peri-articular Wounds.—After the shot wounds of the soft parts of the lower extremity implicating the larger vessels and nerves, or producing great lacerations, or complicated by the lodgement of foreign bodies, cases are to be considered in which missiles, without immediately injuring the osseous articular surfaces, so injure the surrounding ligaments and other soft parts, in some instances even the synovial membrane, as to light up immediate or consecutive inflammation in the capsular cavity, or to induce, through the formation of cicatricial bridles or by other deformities, a diminution or even abolition of the movements of the joint. These injuries have been discriminated by M. Legouest under the title of *Peri-articular Wounds.*[2] He apparently includes in this group only cases in which the capsular cavity is not primarily opened; but I prefer to adhere to the definition proposed in my monograph on *Excision of the Head of the Femur*,[3] and have not felt at liberty to exclude from this category the rare instances in which evidence indicates the probability of a primary lesion of the synovial membrane without direct implication of the bones of the articulation, and I observe that Drs. Beck and Fischer adopt a similar view.[4] After a careful analysis of the reports of cases liable to belong to this group, four hundred and thirty-seven have been classified as instances of peri-articular shot wounds of

[1] The Army Medical Museum is rich in specimens of projectiles extracted from the soft parts of the lower limbs. Besides those described in the text, there are twenty examples of small missiles extracted from the soft parts of the thigh. These specimens are numbered 176, 1095, 1368, 2559, 2654, 2971, 4460, 4476, 4480, 4501, 4502, 4507, 4520, 4521, 4552, 4553, 4561, 4574, 4624, 4693. Brief notes of the particulars regarding these cases may be found in the *Catalogue of the Surgical Section* of 1866, from pages 593 to 597. Two of the most remarkable are illustrated in the annexed wood-cuts. That represented in FIGURE 8 was extracted by Assistant Surgeon J. T. CALHOUN, U. S. A., from the thigh of a private of the 12th New York, at the battle of the Wilderness, May 7, 1864, and was regarded as an explosive ball. *Specimen* 4553 (FIG. 9) was remarkable for having entered the left thigh below and in front of the great trochanter, and having passed subcutaneously around the pubic region and lodged in the right thigh five inches above the patella. The case is that of Private A. G. D——, 13th Indiana, wounded at Gauley River, November 2, 1862; the ball was extracted by Surgeon JOHN NEILL, U. S. V., April 14, 1863. There are seven specimens of missiles extracted from the fleshy parts of the leg in the Museum, viz: Numbers 1586, 2326, 3199, 4482, 4500, 4514, 4695, and two specimens extracted from the soft parts of the foot, viz: 1580 and 4523. All of these specimens are described, with notes of the cases to which they belong, in the 27th Chapter of the *Surgical Catatogue* already referred to. These specimens are neatly mounted on brass rods. Dr. A. SCHINZINGER (*Das Reservelazareth Schwetzingen im Kriege* 1870-71, Freiburg, i. B., 1873, p. 37) relates that he has a small collection of extracted bullets remarkable for their deformation, and that those extracted from German soldiers have been mounted in silver, and on the setting the name of the wounded man and the date of the battle engraved, at the thoughtful suggestion of the princess of that province.

FIG. 8. — Distorted ball extracted from thigh. *Spec.* 4561.

FIG. 9.—Flattened round ball extracted from thigh. *Spec.*4553.

[2] LEGOUEST (L.) (*Traité de Chirurgie d'Armée*, 2ème éd., Paris, 1872, p. 442). Some citations from his remarks on this subject may be found in the Surgical Volume of Part II of this work, footnote 1, p. 503. His further observation on this point is worthy of consideration, that "when shot wounds and notably even slight contused wounds are situated on the side of extension of joints, where they are exposed to continual attritions and tractions, they readily inflame and sometimes give rise to circumscribed abscesses or diffused phlegmous of more or less gravity."

[3] OTIS (G. A.), *A Report on Excisions of the Head of the Femur for Gunshot Injury. Circular* No. 2, War Department, Surgeon General's Office, Washington, D. C., 1869, pp. 63, 90, 92.

[4] BECK (B.) (*Chirurgie der Schussverletzungen*, 1872, p. 609) details 25 cases, in which the soft parts of the knee joint were either primarily or secondarily involved. Four, or 16.0 per cent., terminated fatally. He also gives 7 cases of flesh wounds of the ankle joint; no deaths. FISCHER (H.) (*Kriegschir. Erfahr.*, 1ster Theil, *Vor Metz*, Erlangen, 1872, p. 102) gives an account of 7 cases in which the knee joint was injured without lesion of the bony structure. Two, or 28.5 per cent., had a fatal termination.

the lower limb, of which forty-nine are referred to the hip joint, three hundred and fifty-one to the knee joint, and thirty-seven to the ankle joint. Each of these subdivisions will be concisely discussed.

In peri-articular shot wounds of the *Hip Joint*, the difficulties of diagnosis are almost insurmountable in the present state of our knowledge. In the cases of recovery, the exact extent of the lesions can only be surmised, and in the fatal cases necroscopic examination will scarcely determine with absolute precision whether the articular capsule was primarily or secondarily opened. Memoranda of forty-nine cases of shot wounds, which the reporters believed to have led to the opening of the coxo-femoral articulation without direct injury of the bones, are found on the registers. Thirty-five instances are adduced in which it was supposed that there was primary lesion of the joint capsule; twenty-one of them are reported as recoveries. Abstracts of seven of these have been already published.[1] Of the remaining fourteen recoveries, such scanty information as can be found in the reports is condensed in the appended abstracts:

CASES 40–48.—Lieutenant D. H. Miller, Co. H, 75th Ohio, aged 28 years, was wounded and captured at Gettysburg, July 1, 1863. After remaining a prisoner for a few days, he was admitted to the Eleventh Corps Hospital. Several weeks later he proceeded to his home in Logan, Ohio, where he was attended by Drs. G. W. Pullen and J. Sharp, who reported his case as follows: "The ball entered the posterier and inferior part of the glutei muscles of the left hip, passed over the neck of the femur, and came out on the inner side of the trochanter major. February 15, 1864, the wound has closed, but the motions of the hip joint are diminished to a great extent, and the leg is so weakened that he is unable to walk without the use of crutches." The patient was discharged from service January 22, 1864, Surgeon A. M. Speer, U. S. V., certifying to "shot wound of hip joint without fracture." Examiner T. O. Edwards, of Lancaster, Ohio, in February, 1871, stated that "the wound had opened and discharged a portion of his blouse," etc. Examiner W. C. Hyde certified, September 10, 1873: "There is flattening of muscles of the hip, the cavity of the joint injured by the missile, and the joint partially anchylosed." The pensioner was paid March 4, 1877.—Corporal *L. Bertram*, Co. A, 6th Louisiana, entered a Confederate hospital at Richmond with "shot wound of right hip, involving the joint," received May 4, 1863, and was furloughed April 15, 1864.—*T. J. Brandon*, a member of Co. F, 14th Alabama, was treated in the Confederate hospital at Farmville for "shot wound in the buttock with injury to hip joint," and was furloughed October 22, 1862.—Private *H. Kimberlin*, Co. G, 48th Virginia, received a gunshot injury of the right hip joint, producing lameness, and was furloughed from the Confederate hospital at Farmville.—Private *C. C. McMurray*, Co. H, 15th North Carolina, was admitted to hospital No. 24, Richmond, with "shot wound of hip joint," and was discharged September 13, 1862.—Private *G. W. Williams*, Co. F, 3d North Carolina, appears on a Confederate hospital case-book as having received a "shot wound of the hip joint, May 3, 1863, the ball being extracted near the knee." Furloughed.—Private J. Hilk, Co. B, 112th Pennsylvania, was wounded in June, 1862. Surgeon E. Griswold, of the regiment, reported, "an injury to hip joint by a pistol ball." The man was discharged from service October 16, 1862. He is not a pensioner.—Private I. J. Brown, Co. A, 18th Infantry, was wounded at Stone River, December 31, 1862. He was treated at various hospitals, and lastly at Camp Thomas, Ohio. Acting Assistant Surgeon C. R. Reed reported that he was discharged March 17, 1864, by reason of "shot wound of left hip joint." He is not a pensioner.—Private M. Ahern, Co. E, 183d Pennsylvania, aged 24 years, was wounded at Spottsylvania, May 14, 1864. Surgeon L. A. Edwards, U. S. A., reported his admission to Lovell Hospital with "shot wound of right hip joint." The man was mustered out July 13, 1865, and is not a pensioner.

Spontaneous luxation after traumatic coxitis from shot injury of the hip joint without fracture, was reported in three instances:

CASES 49–51.—Sergeant I. Murdick, Co. I, 134th Pennsylvania, aged 23 years, wounded at Fredericksburg, December 13, 1862. He was admitted to Stone Hospital, Washington, December 20th, with "gunshot wound of left thigh." Assistant Surgeon C. A. McCall, U. S. A., reported that the man was discharged from Mount Pleasant Hospital, April 16, 1863, because of "gunshot wound over left trochanter, passing in the direction of the hip joint; ball undiscovered and interfering with the free use of the joint." Examiner G. McCook, of Pittsburg, June 22, 1864, certified: * * "Inflammation and suppuration have ensued and have progressed until the round and capsular ligaments of the left hip joint have been destroyed and the femur drawn at least two inches above the acetabulum. The left leg is thrown across the right at least two inches or more above the right knee, resembling the position of a dislocated femur. The heel is elevated, and it is with extreme difficulty that he can walk with the aid of crutches. The toes of the left foot rest on the dorsum of the right." On November 22, 1867, the pensioner was furnished

[1] OTIS (GEORGE A.) (*A Report on Excisions of the Head of the Femur for Gunshot Injury. Circular* No. 2, War Department, S. G. O., Washington, 1869, pp. 90–92): CASE 166, Corporal H. C. Boyd, 39th Ill.; CASE 169, Lieut. C. Duncan, 18th Ind.; CASE 176, Pt. G. W. Minnick, 7th Md.; CASE 177, Pt W. M. Moore, 3d Ohio; CASE 178, Pt. W. N. Morgan, 9th Penn'a Reserves; CASE 185, Pt. Jacob Widmann, 97th New York; CASE 186, Pt. Henry Witzleben, 28th Ohio. In all seven cases the evidence of direct lesion of the articulation was inconclusive, and the opinions of the several surgical attendants were conflicting in each instance. Two cases (Witzleben, Morgan) terminated in false anchylosis. In the latter the adhesions were forcibly and successfully broken up by Professor S. D. GROSS. In one case (Widmann), after suppuration of the joint, the head of the femur was apparently luxated. Professor B. von LANGENBECK holds (*Ueber die Schussverletzungen des Hüftgelenks*, in *Archiv für Klin. Chir.*, B. XVI, p. 286) that, "the most usual result (constanteste Ausgang) of healing shot injuries of the hip joint is in anchylosis."

with an apparatus for dislocated hip joint, by Dr. E. D. Hudson, of New York City. Examiner J. K. Reinholdt, February 7, 1871, certified: "The downward momentum caused the ball to imbed itself securely in the hip joint. * * Parts swollen and tender; wound discharging; more or less injury to great sciatic nerve; limb deficient in temperature; more or less constant pain; confined to bed months at a time," etc. This pensioner died May 7, 1874, of convulsions superinduced by the results of his wound, his attending physician and others stating that the serious attacks of inflammation, resulting in the formation of abscesses, proved a severe tax upon his vitality and prepared the way for his sudden demise.—Private R. Emerick, Co. D, 82d Pennsylvania, aged 28 years, was wounded at Cold Harbor, June 1, 1864, and admitted to hospital at Alexandria, and subsequently to Pittsburg. Surgeon J. Bryan, U. S. V., reported that he was transferred to the Veteran Reserve Corps, October 8, 1864, by reason of "a grapeshot wound, dislocating the right femur." Not a pensioner.—Lieutenant F. Heck, Co. I, 74th Pennsylvania, aged 37 years, was wounded in the right thigh at Rappahannock Ford, August 22, 1862, and was discharged from service October 9, 1863. In 1874, the Examining Surgeons report: "Firm anchylosis, with head of femur thrown out of socket; knee and ankle joints entirely stiff; foot in an extended position, and limb shortened two inches."

Two cases are reported as injuries of the hip joint by large projectiles:

CASES 52–53.—Private J. Teeters, Co. A, 84th Pennsylvania, aged 34 years, was wounded at Bull Run, August 30, 1862, and discharged from service March 29, 1863. Assistant Surgeon J. D. McClure, of the regiment, certifying to "an injury in the right hip joint by a piece of shell, producing paralysis of the whole leg." This man was a pensioner, but has not been heard from since September 4, 1864.—Private *W. S. Gardiner*, Co. A, 14th South Carolina; injury to hip joint from bomb; furloughed.

The entire subject of traumatic lesions of the hip joint is of such importance that it is deemed proper to adduce or to refer to the previous publication of all the information that can be found on the registers, with the warning that, in many instances, the facts are derived from reports suggestive of superficial examination, and sometimes of diagnoses that must be regarded as little more than conjectures.[1]

Of the fourteen *Fatal Cases* in the series of thirty-five shot injuries believed to have been attended with primary lesion of the hip joint without fracture, the details of all are published in *Circular* 2, S. G. O., 1869, already cited.[2] In the reports of many of these cases it is stated that the character of the lesions was verified by necroscopic examination, and in others it may be inferred that autopsies were made, so that the series is, as a whole, more reliable than the preceding.[3]

Of the series of forty-nine cases of reported peri-articular shot wounds of the hip joint, fourteen may be classified as examples of *secondary traumatic coxitis*.[4] Seven were

[1] VON LANGENBECK (B.) (*Über die Shussverletzungen des Hüftgelenks*, in *Archiv für Klinische Chirurgie*, Berlin, 1874, B. XVI, p. 280) remarks: "It may be taken for granted that a gunshot injury of the hip joint may heal under favorable circumstances without traumatic coxitis beginning. Coxitis may certainly be avoided in simple capsule wounds, which are kept perfectly quiet from the commencement, as well as in gunshot injury of the knee joint, as I have seen the recovery of several cases without any inflammation arising. As, however, in most cases (Pott's) side splint was recommended by the surgeon or adopted by the patient, and as during the last war not a few of the men were subjected to distant transport, and, injury of the hip joint not having been discovered, were allowed to go about, it was difficult in such cases to avoid inflammation. It appears to me that we must admit that in all those cases in which coxitis suddenly appears a considerable time after the injury, recovery is certain under favorable external circumstances without any further trouble occurring." [The translation is the version of JAMES F. WEST, F. R. C. S.]

[2] *Circular* No. 2, S. G. O., 1869, *op. cit.*, pp. 90, 91, 92. The names of the patients, the duration of life after injury, and the names of the reporters are noted: CASE 165, W. Blair, survived injury 23 days; extent of injury demonstrated by autopsy; MCKEE, reporter.—CASE 167, A. D. Bradshaw, survived 19 days; verified by autopsy; BURNE, reporter.—CASE 168, P. Cornell, survived 3 days; WOLFE, reporter.—CASE 170, J. W. Faleoner, survived 15 days; autopsy; MORONG, reporter.—CASE 171, S. Finnegan, survived 1 day; COLE, reporter.—CASE 172, G. Green, survived 14 days; GRAHAM, reporter.—CASE 173, F. M. Hate, survived 102 days; HATCHITT, reporter.—CASE 174, J. E. Leedy, survived 7 days; LEAVITT, reporter.—CASE 175, J. McMahon, survived 19 days; BLISS, reporter.—CASE 179, B. F. Pittman, survived 73 days; JANES, reporter.—CASE 180, W. R. Reeves, survived 16 days; autopsy; HARRINGTON, reporter.—CASE 181, T. Smith, survived 28 days; autopsy; VANDERKIEFT, reporter.—CASE 182, R. Taylor, survived 4 days; autopsy; SEABROOK, reporter.—CASE 183, B. K. Wagoner, survived 265 days; HATCHITT, reporter.—CASE 184, of J. Wells, was also reported in *Circular* 2 as belonging to this group; but the carbine ball inflicting the injury, much deformed, with large bone fragments embedded in it (*Specimen* 2994, *Cat. Surg. Sect.*, 1866, p. 603), has since been discovered, and the case has been transferred to the category of shot fractures of the neck of the femur. In three cases, in which the patients died within a few days after the infliction of the injury, it is probable that there were grave concomitant lesions. In those in which they survived two months, three months, and eight months, respectively, there were no autopsies held, and the lesions were not accurately determined. In the eight remaining cases, the patients lived from one to four weeks; the mean was 16 days.

[3] BILLROTH (TH.) (*Chir. Briefe*, u. s. w., Berlin, 1872, p. 238) observes: "I am of opinion, that neither the direct injury of the joint capsule and bone, nor the secondary necrosis, can always be early diagnosticated. In cases resulting favorably, the diagnosis can generally only be made *ex post*, from the total anchylosis of the hip joint, and in many cases only after the discharging of some necrosed bone. . . Nevertheless I had not imagined the diagnosis to be so difficult; I had thought that there must be, under all circumstances, symptoms of acute coxitis; but I was mistaken therein. . . But gradually we arrive at a correct diagnosis in the majority of these cases from the slow progress after the injury, the copious suppuration, rapid debilitation, and speedy decubitus."

[4] *Circular* No. 2, S. G. O., 1869, *op. cit.*, pp. 93, 94. The cases of five of the seven patients who partially recovered have been enumerated in the Circular above cited: CASE 190, of Capt. H. C. Mason, 20th Massachusetts, is more extensively reported by J. MASON WARREN in his excellent *Surgical Observations with Cases and Operations*, Boston, 1867, p. 565. A fortnight after the accident, acute inflammation of the hip joint came on, and WARREN cut down and removed the ball from directly over the capsule of the joint. He ultimately recovered with stiff joint. The next case, No. 191, A. McGee, will be noticed on the next page. In CASE 193, Private S. Schafer, 81st Ohio, was struck in the left hip at Resaca, May 14, 1864, and recovered with a stiff joint, according to Surgeon W. THRELKELD, U. S. V., and others. CASE 196, Private W. A. Shingledecker, 101st Pennsylvania, Gettysburg, July

PLATE LVI.—DRY TRAUMATIC ARTHRITIS OF THE RIGHT HIP.

Case of A. McGee. Spec. 5518, Surg. Sect., A. M. M.

fatal, and seven resulted in recovery. Abstracts of five of the latter have been published in *Circular* 2, and two others are here noted:

CASES 54–55.—Sergeant J. A. Heady, Co. B, 15th Kentucky, aged 22 years, was wounded at Chickamauga, September 20, 1863, and was discharged from Camp Chase July 18, 1864. Surgeon J. T. Carpenter, U. S. V., certified to "shot wound of left hip, the ball entering three inches above and posterior to the trochanter major and remaining; function of hip joint interfered with, and marching impossible." This man is an applicant for pension. The Louisville Examining Board reported, in 1875, that the missile was still unextracted.—Private E. D. Bates, Co. B, 24th New York Cavalry, aged 21 years, was wounded in the left hip at Petersburg, June 17, 1864, and was treated at various hospitals. Surgeon R. B. Bontecou, U. S. V., reported his discharge from Harewood Hospital, Washington, May 5, 1865, by reason of "shot wound resulting in necrosis of head of left femur." The various Examining Surgeons certify to more or less injury of the bone, also that the missile remains in the limb.

Of the seven examples of secondary coxitis from shot wounds which recovered, the most interesting is the one numbered 191 of *Circular* 2, in which the nature of the injuries was observed more than seven years after reparation had taken place.

CASE 56.—Albert McGee, a negro refugee, aged about 30 years, is reported to have been struck at the first battle of Bull Run, July 21, 1861, by a musket ball, which probably entered the right hip at the level of the trochanter major, and, passing downward and forward, made its exit from the inner surface of the thigh just below the perineum. He made a complete recovery with the right lower limb shortened two and a half inches. About seven years subsequently McGee entered the Howard Grove Hospital, at Richmond. Assistant Surgeon J. H. Janeway, U. S. A., then stationed at Richmond, learned from Dr. D. R. Brower that the man came to Howard Grove Hospital in the latter part of October from the settlement of refugees at Hampton, Virginia, and was then suffering with Bright's disease. Professor Hunter McGuire, of Richmond, and Dr. J. N. Upshur, at the time resident physician at the Howard Grove Hospital, have kindly contributed their recollection of the case.[1] An autopsy was made by Dr. J. N. Upshur, and the surgeons who examined the injury of the hip were of the opinion that the head of the femur had been grooved by the ball at its lower part.

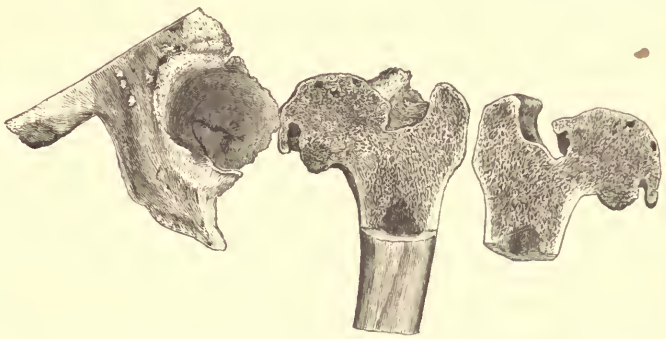

FIG. 10.—Chronic traumatic arthritis of the right hip joint following a shot injury, with secondary suppurative transformations which ultimately eventuated in recovery. *Spec.* 5518.

The pathological specimen[2] was sent to the Army Medical Museum, and there a vertical section of the epiphyses and upper portion of the femur was made, and it clearly appeared that there had never been a fracture of the head, and that the groove, supposed to have been made by the ball, was a depression resulting from a former abscess. The appearances closely resembled those sometimes observed in cases of chronic rheumatic arthritis. They are represented in the wood-cut above (FIG. 10), and yet more satisfactorily in the heliotype opposite (PLATE LVI).

2, 1863, after a gunshot wound disordering the functions of the right hip joint, recovered with a stiff joint, according to the testimony of Examiner of Pensioners G. MCCOOK.—CASE 197, Private T. Swartwood, 25th Ohio, was wounded May 8, 1862, by a musket ball which injured the right hip joint. Pension Examiner C. HUPP testified that the limb was shortened two inches and all movements of the articulation caused severe pain.

[1] Dr. HUNTER MCGUIRE writes, Richmond, Va., October 17, 1877: "I have received your letter of the 12th inst., and am sorry to be able to give you so little information about the case you speak of (CASE 191 of your report on excisions at the hip joint). I think I gave you at different times two specimens of shot wounds of the head of the femur. One of these cases you saw in the College Hospital here, before I operated. [Reference is made to *Specimen* No. 6217, Surg. Sect., A. M. M., an excised head and upper extremity of the right femur with osteomyelitis.] The other is the specimen Dr. UPSHUR speaks of, the one you here refer to. My recollection of this case is not very distinct, but I am quite certain that I looked upon it at the time as a case of peri-articular gunshot wound of the hip, and that the changes about the head and neck of the femur were due to the resulting coxitis. . . Dr. D. R. Brower was in charge of the Howard Grove Hospital when this specimen was obtained. He was, afterwards, superintendent of the Insane Asylum at Williamsburg, Virginia, and I think is now in Chicago and holds some office there under the government. He may be able to give you further information about the case, but I do not think it probable that he will remember anything about it." Dr. J. N. UPSHUR in a letter to Dr. HUNTER MCGUIRE, dated Richmond, October 16, 1877, remarks: "In compliance with your request, I would state in regard to the history of the negro man concerning whom you have received a letter from the surgeon in charge of the Medical Museum at Washington. He came to Howard Grove Hospital, then a hospital for freedmen—suffering with Bright's disease of the kidneys. Having noticed considerable shortening of the right leg, with inversion of the foot, I enquired if he had had fracture of the thigh; he replied that he had been in the army, and was shot by a Confederate sharpshooter stationed in an apple tree, the ball passing just below and through the hip joint. The wound had healed perfectly, and he possessed some motion in the joint. There was no reason for surgical interference at that time. After his death, which occurred a few weeks subsequently, I made a *post-mortem* examination, removing the head of the femur, which I found had been fractured *within* the *capsule*, and recovered with perfect *bony union*. As well as I remember, the bone bore plainly on its surface the track of the ball. The specimen was removed and given to you, and sent by you to the Medical Museum. I could not obtain from the man, who was an ignorant negro, a clinical history of the case."

[2] This specimen closely resembles one figured by M. LEBERT (*Traité d'Anatomie, pathologique gén. et spéc.*, Folio, 1861, T. II, p. 603, et Atlas, T. II, Pl. CLXXXI (Figs. 1–3), in his magnificent iconographic work. This is a specimen presented by M. VERNEUIL as "a beautiful typical specimen of dry arthritis (arthrite sèche) of the upper part of the femur. The upper ledge of the head of the bone is crushed down in the shape of a mushroom. At the anterior part of the neck a considerable projection is seen, a true exostosis of irregular surface, perfectly isolated by a line of demarcation from the rest of the bone. This tissue was at that point very red and vascular. On the surface of the head of the femur is found a multitude of rounded cartilaginous vegetations, some of which, narrow at their base, might have ultimately detached themselves and fallen as foreign bodies into the articular cavity. In spots the diarthrodial cartilage is ossified abnormally. On the specimen a condensation or kind of concentric hypertrophy of the head of the femur is observed in the section, while the lower part of the head of the bone presents, on the contrary, an atrophic rarefaction of its tissue. There is, therefore, an unequally distributed process of osteo-cartilaginous new formation, of atrophic absorption, and of ossification of the normal cartilage." *Loc.*

Abstracts of six of the seven fatal cases of secondary arthritis from peri-articular shot wounds of the hip are published[1] in the oft-cited *Circular* 2. The following is the seventh:

CASE 57.—Private *C. M. Blackwelder*, Co. A, 52d North Carolina, was wounded at Gettysburg, July 2, 1863, and admitted to hospital at Chester about three weeks afterwards. Surgeon E. Swift, U. S. A., reported: "Gunshot wound, followed by a dissecting abscess involving the head of the femur and its ligaments. The patient died of pyæmia, September 21, 1863. The *post-mortem* showed inflammation of the arachnoid membrane with serous effusion, also effusion of serum in the other serous membranes, and twelve ounces of pus in the left pleura."

Of peri-articular shot wounds of the *Knee Joint*, three hundred and fifty-one cases were reported. It would appear that of two hundred and fifty-five of these cases, according to the evidence available, the articular capsule of the knee joint was directly involved without fracture, and that in ninety-six cases the projectiles did not injure the joint, which was opened by secondary traumatic arthritis.[2] Of the aggregate of the three hundred and fifty-one cases, ninety-eight or 27.9 per cent. had a fatal termination. Three hundred and thirteen cases were treated without operative interference and thirty-eight were followed by amputation. The latter will be enumerated in the tabular statements of amputations following shot flesh wounds of the lower extremities. Of the three hundred and thirteen cases treated without operative interference, two hundred and forty-four recovered and sixty-nine or 22 per cent. proved fatal.

In the following two cases of recovery the joint appeared to be directly injured. The patients recovered with considerable use of the limbs:

CASE 58.—Private A. Parker, Co. K, 5th Maine, aged 18 years, was reported by Surgeon C. S. Tripler, U. S. A., as having received a "bullet wound of the left knee" at the battle of West Point, May 7, 1862. Surgeon A. B. Mott, U. S. V., in charge of the Ladies' Home Hospital, New York City, recorded the following description and result of the injury: "A musket ball entered the left knee joint at the junction of the tibia and fibula, passed through the joint, and emerged at the inner edge of the internal hamstring. Bleeding occurred freely for about forty-five minutes and then ceased spontaneously. The pain after the wound was very severe. On the day following a consultation of surgeons was held, when it was thought amputation would be necessary; but the operation was postponed. Two days after he went to Fort Monroe, where he remained until May 25th, when he came to this hospital. While at Fort Monroe he suffered considerable pain for six days after the receipt of the injury, and cold-water dressings constituted the entire treatment, with perfect quiet of the limb. When admitted here the leg and foot were badly swollen; discharge slight and watery; orifice of exit closed. The external wound was attacked with gangrene, and a deep slough came away. Charcoal poultices were used, and creasote, and the wound stuffed with pulverized cinchona. After the slough came away there was some synovitis, and tincture of iodine was applied for several weeks. The general treatment was tonic and sustaining; porter and ale were taken occasionally but not regularly. September 5th, wound has healed with a good cicatrix. There is stiffness in the knee which is gradually improving. Treatment: cold douche, passive motion and careful use of the limb. Patient has used crutches and afterwards a cane, but now uses neither. December 30th, the knee can be flexed to but little more than a right angle and is very straight. Patient walks without a limp, and there is very little weakness in the limb. He has been on guard duty for more than two months." This man was assigned to the Veteran Reserve Corps November 27, 1863. He is not a pensioner.

---

cit., p. 603. In many respects this specimen closely resembles that of McGee, which is represented in FIGURE 10, and in the heliotype print, PLATE LVI, *Med. and Surg. Hist. of the War of the Rebellion*, Part III, Vol. II, pp. page 27. In the specimen in the Army Medical Museum there is more extensive ossification of the cartilage at the rim of the acetabulum, and the neighboring osseous surfaces are more densely studded with osteophytes. The atrophic rarefaction and absorption are more pronounced at the inferior portion of the head, giving rise to the appearance which was mistaken for a groove made by a ball. On such lesions consult further CARL ROKITANSKY, *Lehrbuch der Pathologischen Anatomie*, Dritte Umgearbeitete Auflage, Wien, 1856, B. II, S. 205.

[1] *Circular* No. 2, S. G. O., 1869, *op. cit.*, pp. 92, 94. The six published cases are: CASE 187. Pt. J. Delaney, 51st New York, wounded at Antietam, Sept. 17, 1862; matter burrowed about the left hip joint, and the thin part of the acetabulum was perforated. Dr. WILLIAM M. NOTSON reported his case and death, Dec. 24, 1862.—CASE 198. Pt. *G. J. Dunn*, 18th Mississippi, was struck at Antietam, Sept. 17, 1862. Secondary involvement of the head of the left femur, from which he died June 19, 1863. A wood-cut of the specimen is reproduced in the *Circular*.—CASE 189. Pt. A. Hall, 1st Cavalry, was wounded in Louisiana, Sept. 27, 1863, the ball penetrating ultimately into the hip joint of the left side. Death, January 12, 1866, Asst. Surgeon A. HARTSUFF, U. S. A., having reported the case.—CASE 194. Serg't C. M. Seovil, 14th Connecticut, wounded May 12, 1864, received a musket contusion of the left hip joint. He died July 14, 1864, as reported by Surgeon T. R. SPENCER, U. S. V.—CASE 195. Lieut. J. G. Seldon, 2d Cavalry, received July 3, 1863, at Gettysburg, a wound of the left thigh in the vicinity of the hip. The hip joint became involved secondarily. He died Sept. 17, 1863. Asst. Surgeon R. F. WEIR reported the case.—CASE 198. Serg't C. B. Wheeler, 81st Indiana, received a shot wound of the left hip joint, near Atlanta, August 8, 1864. The injury soon affected the articulation, and Surgeon M. S. SHERMAN, 9th Indiana, reports that he had profuse suppuration, and died October 7, 1864.

[2] HEINE (C) (*Die Schussverletzungen der unteren Extremitäten*, Berlin, 1866, p. 58) observes: "Shot wounds of the soft parts, in which, secondarily, suppuration of the joint resulted from the breaking down of the tissues surrounding the shot channel, especially at the knee joint, were not very rare, while at the hip joint we only observed a solitary but very remarkable case of this kind." KIRCHNER (C.) (*Aerztlicher Bericht über das Königlich Preussische Feld-Lazareth im Palast zu Versailles*, Erlangen, 1872, p. 86) tabulates 27 injuries of the soft parts of the knee joint; but does not give the results. ARNOLD (J.) (*Anatomische Beiträge zu der Lehre von den Schusswunden*, Heidelberg, 1873, pp. 123, 124) gives details of 2 cases of shot wounds of the knee joint, in which, at the autopsies, the bones of the joint were found uninjured.

CASE 59.—Private *G. Deacon*, Co. G, 14th Virginia Cavalry, aged 25 years, was wounded at Boonesboro', July 8, 1863, and admitted to the Cavalry Corps Hospital. Surgeon S. B. W. Mitchell, 8th Pennsylvania Cavalry, noted a "flesh wound at the knee joint." One week after the reception of the injury the wounded man was transferred to hospital at Frederick, whence Acting Assistant Surgeon W. S. Adams reported the following history: "He was wounded by a spent ball, which entered on the outer lateral surface of the right knee, passing inward and forward, striking the patella and lodging. The patient worked the ball out with his finger on the field. By examination I find no evidence of the ball having entered the cavity; the joint can be moved without pain, and there is no evidence of effusion. Simple dressings were ordered to the wound. On July 25th the external opening had closed and an abscess was forming at the point of lodgement of the ball. Enlarged the external opening so as to communicate with the abscess, when about a half ounce of pus escaped, but no synovial fluid, although there was evidence of the joint being involved, but perhaps not communicating with the opening. On the following day the swelling of the joint was more extensive and fluctuation well marked. Tincture of iodine was then ordered to be applied to the joint twice a day, and the limb was placed in Smith's anterior splint. On August 10th the wound had nearly healed, effusion within the joint had almost entirely subsided, and the patient was comfortable. By August 20th the wound was entirely healed; appearance of joint natural. Considerable anchylosis existed, partly owing perhaps to deposit and partly to long continuance in one position. About a week later the splint was removed, and afterwards passive motion was resorted to without producing much pain or tenderness. On September 5th the patient was transferred to Baltimore, having considerable and daily increasing motion of the knee." He was paroled from West's Buildings Hospital on September 25, 1863.

Then follow three fatal cases of direct shot injury involving the cavity of the knee without lesion of the osseous surfaces:

CASE 60.—Private J. Wagoner, Co. F, 116th Pennsylvania, aged 23 years, was wounded at Petersburg, June 22, 1864, and admitted to the field hospital of the 1st division, Second Corps, where Surgeon D. H. Houston, 2d Delaware, recorded: "Flesh wound of left thigh by a minié ball." Surgeon G. L. Pancoast, U. S. V., contributed the pathological specimen (*Cat. Surg. Sect.*, 1866, p. 333, *Spec.* 3260) with the following notes of the case: "The patient entered Finley Hospital, Washington, July 1st, with shot wound through left knee joint. The bone was not injured. He died July 17, 1864. Two days before death signs of pneumonia presented themselves. An autopsy was made by Acting Assistant Surgeon G. H. Hopkins, who found extensive inflammation extending all around the joint and its neighboring parts. The femur and tibia were denuded of cartilage around the edges. In the cavity of the thorax there was considerable pleuritic adhesion, with effusion of thick pus, the lungs themselves being very much congested and hepatized—in fact, the lungs were diseased throughout their entire extent. There was also effusion both in the pleura and pericardium." The specimen consists of the bones of the injured knee joint.

CASE 61.—Private E. Dolan, Co. D, 5th U. S. Cavalry, aged 21 years, was wounded at Gaines's Hill, June 27, 1862. Acting Assistant Surgeon R. P. Thomas contributed the pathological specimen (*Cat. Surg. Sect.*, 1866, p. 333, *Spec.* 227), with the following description: "The patient was wounded by a bullet, which entered on the outside of the left knee joint opposite its lower portion, and made its exit at the inside of the popliteal region, nearly on a horizontal line with the wound of entrance. He was admitted to the Episcopal Hospital, Philadelphia, July 30th, and died on September 30, 1862. During this period he was in a very low condition, the wounds and abscesses in the neighborhood of the joint discharging profusely the greater part of the time; he also suffered from diarrhœa. An autopsy, performed a few hours after death by Acting Assistant Surgeon R. P. Thomas, showed "loss of cartilage, and ulceration of the heads of the femur, tibia, and fibula, with extension of the disease on the posterior aspect of the femur and between the heads of the tibia and fibula. There was also ulceration of the posterior face of the patella and abscesses in the soft parts." The specimen (FIG. 11) consists of the bones of the knee. The age of the patient is perhaps overstated. The epiphyses, both in the tibia and fibula, were not united, and the real age was, probably, under 20; possibly did not exceed 19 years of age.

FIG. 11.—Bones of left knee. *Sp.* 227.

CASE 62.—Private U. Conn, Co. M, 12th Pennsylvania Cavalry, aged 28 years, was wounded during a cavalry skirmish at Frederick, July 10, 1864, and was admitted to hospital the same day. Acting Assistant Surgeon J. H. Bartholf reported: "He was wounded in the right knee joint by a pistol ball. The missile entered at the lower inner edge of the patella, and I removed it from the joint, having put in my finger between the femur and tibia after enlarging the wound to feel the ball. There was no fracture of any bone. On consultation, it was determined to try to save the limb. The joint was freely opened and local antiphlogistic treatment was employed. Great pain and swelling, for a few days only, ensued, with but slight irritative fever at any time, and the pulse for weeks ranged from 85 to 95. Sometimes for a fortnight at a time he had a really good appetite; this notwithstanding that extra capsular abscesses appeared early and continued throughout to discharge much; at other times he was in a precarious condition. He was placed on a water-bed, being thin in flesh on admission and soon troubled with bed-sores. About a month before his death there was some cough. He sank very gently, and died October 14, 1864. The *post-mortem* examination revealed the recovery from the joint wound by obliteration of its cavity and bony anchylosis, which was not so firm, however, but that accidental violence partly broke it. The crucial ligaments were still undestroyed. There was one vast abscess from the knee to the groin encircling the femur, and another four inches long from the knee downward—neither of them communicating with the joint. He had gray hepatization (pneumonic) of two-thirds of the middle lobe of the right lung, all the rest of the lungs being healthy. The heart was very small and its weight six ounces. All the other organs were healthy."

In the three following cases the projectile did not open or enter the knee joint, and the involvement of the articulation was secondary in its nature:

CASE 63.—Private E. Williams, Co. E, 5th Michigan Cavalry, aged 26 years, was wounded during the engagement at Shepherdstown, August 26, 1864. Acting Staff Surgeon N. F. Graham reported his admission on the day of the injury to

the field hospital at Sandy Hook with "shot wound of right thigh," and his transfer to Frederick two days afterwards. Acting Assistant Surgeon J. C. Shimer, from the latter hospital, made the following report of the case: "He was wounded by a fragment of a shell, which lodged in the external muscles of the lower third of the thigh in close proximity to the bone. It was extracted on the field through the opening. Upon admission the patient's general condition was good. He experienced no pain whatever from the injury. Suppuration was going on finely and everything indicated a speedy recovery. The wound was thoroughly examined with the finger and a sinus found leading in the direction of the knee, but not into the joint. September 15th, patient complains of slight pain and tenderness in knee. The discharge has nearly subsided and the wound is healing. I enlarged the opening so as to allow free vent for the pus. Tincture of iodine is directed to be applied every other day. September 25th, for the last few days there has been some general derangement of the whole system; appetite somewhat impaired; pulse excited; bowels irregular. The knee is still painful, especially upon pressure, and the discharge is the same in quantity. Ordered fifteen drops of tincture of iron three times a day, with a half pint of milk-punch, a poultice of flaxseed meal to be applied around the joint, and the limb to be kept at rest. September 30th, no change in the general condition. The discharge of pus has ceased, but a thin oily looking material, resembling synovia, constantly exudes from the small opening that remains at the entrance of the wound. October 10th, patient has been doing well until to-day; is very restless; pulse accelerated to 128; appetite very moderate; complains of excruciating pain in the knee. The wound has healed externally. Tonics, stimulants, and generous diet are continued; one pill of opium is given four times a day, and blisters are applied over the joint. October 20th, patient has received considerable relief from the blisters. The blistered surface having healed on October 25th, I directed them to be reapplied and the surface to be kept excoriated by an ointment of Goulard's cerate and powdered cantharides. The other treatment was continued. 28th, pulse 113; suffers but little pain in knee, and feels quite encouraged. An opium pill is given at bedtime. 30th, pulse 110; appetite improving; bowels regular; tongue clean; knee of its original size and no pain on pressure. November 10th, general health rapidly improving; the ointment is discontinued. November 18th, walks about the ward with a splint adjusted to favor the knee and keep it at rest; general health excellent. On December 1st the tonics and stimulants were discontinued and the splint removed from the limb; the knee is anchylosed, and no passive motion is made for fear of exciting inflammation. On December 21st the patient received a fall, the entire weight of the body resting for the time on the injured limb. He was directed to be confined to bed, the limb to be kept at rest, and iodine to be applied over the knee; parts painful. December 24th, doing well; no constitutional disturbance. December 29th, pain and swelling subsided; patient on crutches again. January 10, 1865, patient transferred to Michigan." Assistant Surgeon D. O. Farrand, U. S. A., reported that the man was discharged from Harper Hospital, Detroit, May 26, 1865, by reason of "anchylosis of the knee joint, produced by the wound." Williams is a pensioner, and has been reported by various examiners as suffering from "complete anchylosis of the right knee joint." He was paid June 4, 1876.

CASE 64.—Private *T. G. Scott*, Co. B, 54th North Carolina, aged 45 years, was wounded at Harper's Farm, April 6, 1865, and admitted to the field hospital of the 3d division, Second Corps. Surgeon O. Everts, 20th Indiana, noted, "shot flesh wound of left knee." From the field hospital the wounded man was transferred to City Point, and thence, on April 22d, to the West's Buildings Hospital, Baltimore. Acting Assistant Surgeon A. Kessler contributed the specimen, represented in the annexed wood-cut (FIG. 12), with the following description: "A minié ball passed through the left leg just below the knee joint, implicating the joint but not laying it open. The leg became much swollen and discolored, and from the openings flowed a quantity of what appeared to be arterial blood. Soon after the patient's admission there appeared severe constitutional symptoms: rigors followed by high and continued fever, delirium, extreme nervousness, much prostration, constant vomiting, and sleeplessness. Amputation, which, at an earlier period, might have saved his life, was then pronounced impracticable, and the patient died with symptoms of pyæmia, May 4, 1865. A *post-mortem* examination of the limb revealed the fact that the tissues above and below the joint, the muscles, fascia, etc., were a gangrenous mass, and that the greater portion of the joint itself was divested of its periosteum and rapidly assuming the character of caries. Otherwise the joint was found to be intact, exhibiting no fracture."

FIG. 12.—Caries of left knee joint. *Spec.* 4205.

CASE 65.—Private W. P. Werden, Co. K, 34th Massachusetts, aged 20 years, was wounded at New Market, May 15, 1864. Surgeon J. V. Z. Blaney, U. S. V., reported his injury as "a shot wound of the knee." Acting Assistant Surgeon J. H. Bartholf contributed the following history from the General Hospital at Frederick: "The patient was admitted here May 25th, from the post hospital at Martinsburg, with a flesh wound of the left leg near the knee, caused by a minié ball. The missile entered a half inch below the patella, between it and the tuberosity of the tibia, directly over the quadriceps extensor tendon, and lodged superficially just under the skin, whence it was extracted the same day. He was removed in an ambulance sixty miles to Martinsburg. The joint soon became inflamed and swollen, and remained so until his admission here. Water dressings had been applied. I found the joint inflamed and very much distended, probably with synovia or a collection of pus, over the tendon of the quadriceps. A counter-opening was made at the lowest part of this, and evaporating lotions applied, on the 29th of May. On the 1st of June the patient was somewhat better. June 4th, ice applied to the knee. June 11th, patient has made very rapid and great improvement, so that the synovitis is nearly gone and the abscess is almost healed; but there is communication with the knee joint from the abscess, a minute orifice having been made by ulceration apparently, through which healthy-looking synovia has been flowing in small quantities for a couple of days. There is no constitutional trouble. June 12th, no more synovia comes out. June 17th, patient is permitted to get out of bed and walk a little. July 4th, has gone on very favorably to this time, walking with a cane. Is now transferred to Baltimore." After this date the patient was treated in hospital at Annapolis until September 13, 1864, when he was returned to duty. The Adjutant General of Massachusetts reports that the man was mustered out June 30, 1865. He is not a pensioner.

Of thirty-eight recorded instances of lesions of the knee joint without injury to the

articular surfaces, followed by amputation, twenty-nine or 76.3 per cent. were fatal. Two of the cases will be detailed, and all will be enumerated in the tables of amputation at the end of this section:

CASE 66.—Lieutenant J. A. Boies, Co. H, 13th Infantry, aged 22 years, was wounded in the assault on Vicksburg, May 22, 1863. He was admitted on a hospital transport and conveyed to Memphis, whence he was admitted to the Marine Hospital at Chicago on June 8th. Acting Assistant Surgeon R. N. Isham reported: "He was struck upon the outer side of the left knee by a cannon shot from a distance of about two miles. The ball probably only glanced over the surface, for there was the merest trifling appearance of a redness, but no wound or bruise upon the surface. Amputation at the upper third of the thigh was performed on June 18th, and death resulted June 28, 1863, from pyæmia. A frequent pulse, brown tongue, anxious expression of the face, and diarrhœa indicated the existence of the poison on admission. The strongest symptom, that of profuse discharges from the bowels, almost involuntary, and of a color, smell, and consistency of the discharge from the stump, together with the sickening sweetish odor of the perspiration and chills, indicated the invasion of the disease in a marked manner on the night of the 18th. The treatment was by iron, quinine, and stimulants. Scrupulous attention was given to the stump, removing all soiled dressings three times a day and injecting the wound with a solution of bromine and occasionally with tincture of myrrh and balsam peru. This partially succeeded in correcting its unhealthy appearance and producing the secretion, for a short time, of good-looking pus. There never was any attempt at healing in the wound, the edges of which looked like 'cut edges of pork.' The discharge from the wound was of a dark-colored thin offensive character. There was no sloughing or gangrene. The system seemed to make great efforts to eliminate the poison, as evidenced by the profuse perspiration and diarrhœa. The blood seemed to part with its serum easily. No clot was formed in the stump, and late in the progress of the disease the discharge consisted of altered blood. The pulse during the case was from 130 to 150. No *post-mortem* was allowed by his friends, but the sudden invasion of pain in the joints, a swelling of the knee and fluctuation, satisfied me that pus had formed in the synovial cavity."

CASE 67.—Sergeant G. A. Dyer, Co. G, 6th Maine, aged 21 years, was wounded at Rappahannock Station, November 7, 1863, and was admitted to Armory Square Hospital, Washington, two days afterwards. Surgeon D. W. Bliss, U. S. V., reported: "A minié ball entered four inches below and in line with the trochanter major of the right thigh, took a downward and inward course, and could not be found on admission to the hospital. On November 29th, the missile was extracted from the popliteal space; suppuration continued free and of good character. Two weeks subsequent to the extraction of the ball a bit of woolen cloth came from the lower wound. December 10th, patient was allowed to get up and move about, using crutches. December 25th, knee joint became painful and continued to swell from this date. Under iodine the swelling subsided to a considerable extent, but the pain continued; suppuration still free and at times thin and poor in character. On February 1, 1864, synovial fluid was observed from the upper point in the discharge; pain in knee joint still considerable at night, and leg enlarged. On February 19th, the thigh was amputated above the condyles by flap operation; four arteries tied; loss of blood small; patient in fair condition constitutionally. On opening the knee joint after the operation, erosion of the cartilages was discovered, and an abscess below the knee joint communicating with it. February 22d, patient doing well." The specimen represented in the adjacent cut (FIG. 13) was contributed by Surgeon Bliss, and consists of the bones of the knee of the amputated limb, showing a slight deposit of callus on the posterior aspect of the shaft, apparently due to the irritation set up by contact with the ball in position. The patient was discharged from service April 18, 1864, and pensioned, and subsequently furnished with an artificial limb. In his application for commutation, dated 1870, he described the stump as being in a sound condition. The pensioner was paid June 4, 1876. In the cut only a portion of the specimen, which consists of the four bones entering into the articulation, is represented. The amputation was done at the middle of the femur, and not through the lower third as represented in the cut.

FIG. 13.—Lower part of right femur studded with osteophytes after shot contusion. *Spec.* 2047.

Of peri-articular shot wounds of the *Ankle Joint*, thirty-seven cases are indicated on the records;[1] but the evidence in regard to the precise nature of the injury may be termed unsatisfactory. In fifteen cases, of which one proved fatal, no operative interference was deemed necessary. In the remaining twenty-two cases the limb was amputated at the leg, with fatal results in twelve instances. One case may here be detailed; all the cases of amputations of leg for peri-articular shot wounds of the ankle joint will be enumerated in the tables of amputations following shot flesh wounds of the lower extremities:

CASE 68.—Corporal E. D. Goodell, Co. D, 25th Massachusetts, aged 21 years, was wounded at Cold Harbor, June 3, 1864. Surgeon S. A. Richardson, 13th New Hampshire, recorded his admission to the Eighteenth Corps field hospital with "shot wound of right ankle." Surgeon R. B. Bontecou, U. S. V., reported the result of the injury as follows: "The patient entered the Harewood Hospital, Washington, June 10th, with shot wound of right foot near os calcis, the ball severing the

[1] The records of shot flesh wounds of the ankle joint without injury to the bones are very meagre. KIRCHNER (C.) (*Aerztlicher Bericht über das Königlich Preussische Feld-Lazareth im Palast zu Versailles*, Erlangen, 1872, S. 86) tabulates 8 cases of flesh wounds of the tibio-tarsal articulation but gives no results. HEINE (C.) (*Die Schussverletzungen der unteren Extremitäten*, Berlin, 1866, S. 5) thinks it very remarkable that not a single case of secondary arthritis following "shot wound of the ankle joint without lesion to the bone" was observed.

tendo-achilles. On admission, he was very weak. The parts were swollen and suppurating freely, and became subsequently gangrenous, the tarsal and metatarsal bones denuded. An operation was deemed necessary, and performed on July 22d by Acting Assistant Surgeon B. F. Butcher, who amputated the leg at the lower third by the circular method. Sulphuric ether was used. The patient improved after the operation, and was furloughed August 17th, the stump looking well." The bones of the amputated ankle were contributed to the Museum by the operator, and constitute specimen 3332 of the Surgical Section. In December following the man was admitted to Dale Hospital, Worcester, whence Surgeon C. H. Chamberlain, U. S. V., reported that the stump assumed a large suppurating surface with several sinuses leading to diseased bone, and that on February 20, 1865, he removed a sequestrum eight inches in length by a longitudinal incision. After this the patient was reported as having made excellent progress, and the stump as being nearly healed on March 31st. He was ultimately discharged from the Soldiers' Rest, at Boston, October 31, 1865, and pensioned. The pensioner was paid March 4, 1877.

Peri-articular shot wounds of the joints should be treated at the outset by complete immobilization of the articulation, by wire-cloth splints, or plaster bandages, the wound being covered with simple dressings of thick compresses saturated with cold lotions. The complications are to be combatted as they arise.

Complications of Shot Flesh Wounds of the Lower Extremities.—In the great series of 58,702 shot flesh wounds of the lower limbs, besides the groups characterized by lesions to the principal blood-vessels and nerves, by extensive lacerations, by lodgement of foreign bodies or extension of inflammation to the joints, there were many examples of complications of *Pyæmia*, *Gangrene*, *Tetanus*, *Erysipelas*, and *Hæmorrhage*. A certain number of cases have been classified in each of these categories. The reader, however, must guard against the belief that this class of cases is complete, for, as explained heretofore, there was neither time nor clerical assistance for an exhaustive search. The cases, however, have been impartially selected, and the results probably present a fair average.

Pyæmia.—Three hundred and twenty-eight cases, of which three hundred and twenty, or 97.5 per cent., resulted fatally, were found recorded. One of the eight cases of recovery will be detailed:

Case 69.—Private S. S. Chase, Co. L, 1st Maine Cavalry, aged 43 years, was wounded at Stony Creek, October 27, 1864, and admitted to the field hospital of the 2d division, Cavalry Corps, where Surgeon F. LeMoyne, 16th Pennsylvania Cavalry, noted: "Shot flesh wound of both legs." The patient was moved to City Point on the following day, and on November 14th he was transferred to Washington. Surgeon D. W. Bliss, U. S. V., made the following report: "He was admitted to Armory Square Hospital with wounds of the right thigh and left leg. The first ball entered the thigh posteriorly, about the junction of the middle and upper thirds, passing inward and a little downward, and emerging on the inner side of the thigh; the second ball entered the left leg on the posterior aspect, about the middle, and passed directly forward, emerging on the inner side, one and a half or two inches from point of entrance. The patient had an unhealthy appearance and was considerably emaciated when admitted, the wounds discharging a very thin and offensive matter, not very profusely. On November 26th, pyæmia became developed; patient had several violent chills, which were repeated on the following days, when his wounds became dark colored and dry and ceased to discharge, and he grew delirious. From this period quinine, iron, and chlorate of potassa were prescribed, with stimulants and the most nourishing diet, together with applications of creasote, tannin, and solution of chlorate of patassa to the wounds, under which treatment he gradually improved. At present (December 31st) his wounds are about healed and he is able to leave his bed, being greatly improved in every respect, and convalescent." The man was discharged from service March 24, 1865, because of "permanent contraction of the gastrocnemius muscle of the left leg, resulting from the wound." Examiner J. O. Perry, of Portland, Maine, certified, April 30, 1868, that "both wounds are very tender;" and that "the wound in the leg so far involved the nerves that the leg below it and the foot are quite numb." The Portland Examining Board reported, in 1873 and 1875, that they find deep, and, on the left leg, adherent scars, with considerable loss of tissues in both wounds. The pensioner was paid June 4, 1876.

In the greater proportion of the fatal cases, although the ratio of mortality was so large, necroscopic appearances were not recorded:

Case 70.—Sergeant M. Armstrong, Co. M, 6th Cavalry, was wounded at Williamsburg, May 4, 1862, and admitted to the Hygeia Hospital, Fort Monroe, five days afterwards, when Surgeon R. B. Bontecou, U. S. V., noted a "shot wound of left thigh." Acting Assistant Surgeon S. J. Radcliffe contributed the following history, from Hospital No. 1, Annapolis: "The ball entered the external aspect and posterior of the upper third of the thigh, passing inward and downward, and emerged about the centre of the middle third. The patient was in hospital at Fort Monroe about ten weeks, when he rejoined his regiment. He went through most of the great battles and skirmishes until Gettysburg, in July, 1863, when he was taken prisoner at Fairfield, Penn., and went to Richmond via Staunton, arriving there on July 20th. He was paroled and left the enemy's lines on the 23d, arrived at Annapolis on the 24th and at Camp Parole on August 2d, and entered this hospital September 20th. He states that the leg has not been painful except in cloudy weather, and has not swelled, and that his health

has been good. Prescribed pills consisting of quinine one and a half grains, and blue mass and capsicum one half grain each, to be given every four hours. September 25th: Had a chill yesterday; tongue coated; skin dry; pulse quick; conjunctiva yellow; countenance dejected and of painful expression; great lancinating pain in leg; nervousness; bowels irregular. Stopped the pills and gave quinine in solution, five grains every six hours. September 27th: Has lost flesh during last week. Has had continued fever, and the leg has been swelling for two or three days and is very painful, the least motion being painful; abscess forming between the former orifices of the wound on the posterior aspect; general condition unfavorable. A large flaxseed poultice was applied to envelope the whole thigh, and the quinine was continued. Patient objects to taking stimulants, and takes but little. October 1st, A. M.: The thigh, from the groin to the knee, has continued to enlarge to this date, with sharp throbbing pain, sleeplessness, depressed nervous condition, deafness, fever of a low type, diarrhœa and loss of appetite; patient quite hectic, pulse quick, and cheeks flushed; abscess pointing at the eschar or orifice of wound of exit. Made an incision from one to five inches long, and a full stream of dark, thin, offensive matter followed, amounting to nearly two pints; bathed with warm water and vinegar, and continued the stimulants, beef-tea and quinine, with an occasional dose of compound mixture of catechu. 5 P. M.: Patient feels better; pulse quick and feeble; skin in good condition; tongue cleaner; bowels better. Ordered spirits of mindereri, one half ounce, to be given alternately with the other medicine. October 3d: Abscess still discharging very dark, thin, and fetid matter; patient very prostrate; emaciation very rapid and distinct. Gave stimulants freely and often. October 3, A. M.: Patient very feeble, pale and thirsty; pulse quick and sharp; bowels worse; delirium most of the night, and nausea; abscess still discharging; leg very much swollen and highly sensitive; sloughing about the wound. Applied charcoal and yeast poultices, and gave tincture of chloride of iron, twenty-five drops, with quinine every four hours. 3 P. M.: Pupils contracted; stupor; pulse 120, feeble, sharp, and quick; very sensitive to touch; bowels more involuntary; leg largely infiltrated, red and swollen, and pits at the knee; very little discharge of bloody serum; patient sinking. Died at 5.30 A. M. on October 4, 1863."

An example of the series of fatal cases in which autopsies were made is subjoined. This series constitutes seventy-three of the three hundred and twenty cases.

CASE 71.—Sergeant D. A. Lent, Co. A, 6th New York Heavy Artillery, aged 24 years, was wounded at Cedar Creek, October 19, 1864. Surgeon W. A. Barry, 98th Pennsylvania, noted his admission to the Sheridan Field Hospital with "shot flesh wound of right leg." Several days after being wounded the man was transferred to the Camden Street Hospital, Baltimore, and subsequently to Rulison, Annapolis Junction, whence Acting Assistant Surgeon A. Marion reported the following history: "The patient was admitted to this hospital January 4, 1865, with a wound of the right leg, middle third, a minié ball entering on the anterior aspect one inch outside of the tibia, lodging between the tibialis anticus, tibialis posticus, and the anterior tibial artery. When admitted the wound was completely healed up, but the leg was much swollen and no ball could be detected. During the first week after his admission the patient had his leg rolled up with a bandage, and the swelling completely disappeared. He became able to walk about until January 18th, when he again complained, and on examination I found the leg again much swollen, with a dark spot located where the wound first healed up. After this flaxseed poultices were constantly applied until February 2d, when, on opening the wound, the ball was carefully removed from its place of lodgement. On the two days following the operation the patient had a severe fever and chills, with extreme pain and great depression. I ordered eight grains of calomel with ten grains of rhubarb to be taken at once, followed by a saline aperient. On the morning after the 4th, I ordered strong beef-tea, with brandy, to be taken freely. This treatment was continued until February 7th, with some saline draughts, according to the condition of the bowels. On the morning of the 8th, I found the patient greatly depressed and complaining of extreme pain in the joints, and on examining the wrists and the left shoulder joint I discovered them to be very much swollen, with a peculiar boggy feel to the touch. All these symptoms were attended with rigors, drowsiness, yellowness of the skin, and offensive perspiration, sometimes accompanied with delirium. Poultices were applied over the joints, with warm fomentations, and opium was given to relieve the pains every night. The treatment was continued, but no amelioration whatever of the symptoms took place, the patient gradually sinking until the morning of February 15, 1865, when he died. At the *post-mortem*, an abscess was found in the upper lobe of the right lung, about two and a half inches long and two inches in width and depth, filled with thick pus. Both lungs were much congested. The right ventricle of the heart was filled with a semi-organized clot. Kidneys about six inches long and four inches wide; small abscesses were found in the cortical portion of each one. Pus was also found in the urethra. Liver, spleen, pancreas, stomach, and intestines normal. About one teaspoonful of thick fetid pus was found in the right knee joint, and about half as much in the right wrist joint. There was no pus in the ankle joints."

It is to be regretted that autopsies were not more generally practised in cases of this group, and that in the exceptional cases the necroscopical records were so imperfect.

Hospital Gangrene.—The shot flesh wounds of the lower extremity that were distinguished by the supervention of hospital gangrene[1] numbered two hundred and eighty-three, with one hundred and fifty-eight deaths, or 55.8 per cent. Details of three cases of recovery are appended:

CASE 72.—Private W. J. Briggs, Co. A, 102d Pennsylvania, aged 27 years, was wounded at Chancellorsville, May 3, 1863. Assistant Surgeon J. C. McKee, U. S. A., in charge of the General Hospital at Pittsburgh, reported the following

[1] In *Investigations upon the Nature, Causes, and Treatment of Hospital Gangrene as it prevailed in the Confederate Armies*, 1861–1865, by JOSEPH JONES, M. D., published in the *Surgical Memoirs of the War of the Rebellion collected and published by the U. S. Sanitary Commission*, the author details many illustrations of gangrenous wounds resulting from shot wounds of the lower extremities. Instances may be found in the *San. Comm. Memoir*, Surg. Vol. II, pp. 234, 250, 310, 311, 315, 318, 329, 331, 334, 337, 347, 375, 380, 388, 394, 399, 406, 411, 437.

history: "The ball passed between the tibia and fibula, about the middle of the leg, escaping through the calf opposite the point of entrance. The patient was four days at Falmouth Hospital, seven days at Douglas, Washington, and was then removed to Satterlee, Philadelphia. Seventeen days after his admission to the latter he was furloughed and came to Pittsburgh. The wound had healed at its entrance and was still discharging at its exit, but was considered fit to travel with. He had several slight chills before leaving Philadelphia, and one of a more severe character after his arrival home, followed by hæmorrhage from the posterior wound, which was arrested. The next day he came to the hospital. The wound presented the unmistakable evidence of gangrene. He was isolated, and nitric acid was freely applied to all parts. The disease was found very extensive, involving the greater part of the calf of the leg. Poultices of charcoal and pyroligneous acid, etc., were applied. The constitutional remedies were quinia, muriated tincture of iron, stimulants, beef-tea, etc. The disease was checked, and the patient is (July 31st) recovering rapidly. The interest in this case is the distance the man carried the contagion, the great rapidity and destructiveness of its attack, apparently uninfluenced by the comforts of a good home and the best of food and nursing." The patient remained in the hospital until September 3, 1864, when he was mustered out, his term of service having expired. The Pittsburgh Examining Board certified, in 1873 and 1875, that there was wasting of the gastrocnemius muscle from gangrene, and that the resulting adhesions have impaired the action of that muscle and cause pain in the ankle. The pensioner was paid June 4, 1876.

CASE 73.—Private A. W. Bretz, Co. D, 49th Ohio, aged 23 years, was wounded in the right thigh, at Murfreesboro', December 31, 1862. Surgeon J. R. McClurg, U. S. V., in charge of the General Hospital at Cleveland, contributed the following history: "The ball entered upon the outer and posterior aspect of the limb, passed through the biceps, semi-membranosus and semi-tendinosus muscles, and out upon the inner side of the thigh. The patient was in Hospital No. 21, Nashville, about ten days, after which he was sent to the West-End Hospital, Cincinnati, where he remained over three months. He says his limb was at one time almost healed, but it soon manifested symptoms for the worse, and afterward discharged considerably for several days. He was forwarded to and arrived at this hospital upon the evening of the 29th of April, and on the 30th his wound was examined and dressed. At this time we found a ragged, foul ulcer upon the back part of the limb, where the ball entered, about one and a half inches in diameter, surrounded by an erysipelatous—or a halo of dusky red—inflammation, hard and painful to the touch. The patient was feverish, restless, unable to sleep; had poor appetite, and appeared much prostrated. He complained of severe shooting pain in the limb and of the disagreeable odor of the wound. We dressed the wound with the creasote ointment and prescribed a tonic treatment. Some three days afterwards the whole integument and cellular tissue, previously inflamed and diseased, became one putrid mass and dropped out, leaving a large cavity, large enough to admit the whole hand. The hæmorrhage at this time was considerable, and was arrested at the time by applying the pure creasote to the whole bleeding cavity, together with compresses, adhesive strips, and a roller from the foot to the groin. The hæmorrhage was by this process arrested, and for two or three days afterwards my assistant surgeons reported the case favorably. But I was again called upon to visit the patient, who was reported to be sinking very fast, and that the wound was bleeding very much. I found to my surprise the whole bandage and bed saturated with blood, and the patient truly in a dangerous condition. Upon removing the bandages and compresses a large mass of coagulated blood and dead tissue dropped out, having the most intolerable stench imaginable. The hæmorrhage was still very great, and I was almost at a loss to know how to stop it. The whole back part of the thigh appeared to be one bleeding cavity. I introduced my hand into the wound and found I could pass my fingers almost up to the tuber ischii. At the bottom of the cavity, entirely exposed to view, were the belly of the biceps, the semi-membranosus and semi-tendinosus muscles. We used cold water, which succeeded in a measure to stop the hæmorrhage temporarily. Immediately afterward, or as soon as the patient had recovered from the shock produced by the loss of blood, I put him under the influence of equal parts of sulphuric ether and chloroform; then commencing immediately below the tuber ischii and cutting through the parts down to the muscles, I brought the knife down and out at the upper part of the cavity, turning the flaps outward and exposing the whole cavity; with a pledget of lint tied to a probang I cauterized every part of this cavity—the flaps and even the muscles—with pure nitric acid until they became perfectly charred and all hæmorrhage entirely ceased. The flaps were now brought together and fixed with wide adhesive strips around the thigh. A compress saturated with a lotion of nitric acid was applied, and over this a roller from foot to groin. The patient was ordered sulphate of quinine one grain, and tincture of chloride of iron fifteen drops, every two hours; also, eggnog, brandy-punch, and essence of beef. From this moment he began to improve rapidly and complained of no more severe stinging pain in the limb. Not the least hæmorrhage ensued afterward, and that most offensive fetid discharge subsided at once. We dressed the sore twice per day afterward, still using a weak lotion of nitric acid. It has progressed and is still (June 1st) progressing most favorably." The patient was assigned to the Veteran Reserve Corps December 11, 1863. There is no record of his ever having applied for pension.

In addition to the history of the case, Surgeon McClurg submits the following remarks in relation to the treatment of gangrene: "There is not a doubt in my mind but that the nitric acid is one of the most, if not the most, efficient remedy in use for sloughing phagedæna and hospital gangrene. I am aware that of late bromine[1] and its compounds are exciting considerable interest in the medical profession as curative agents in hospital gangrene, but I must acknowledge that my experience with these agents will not allow me to call them specific, and I certainly regard them as secondary remedies to nitric acid. The acid is an old and common remedy, and I believe the reason it has not oftener proved its superiority over all other remedies in hospital gangrene has been on account of the cautious manner in which it has been used. This is a serious disease, and the remedy should be freely applied. In the above case, I placed one ounce of acid in a tumbler, dipped my pledget of lint in again and again until the whole diseased part was effectually cauterized. All danger was at once over, and the disease that moment arrested."

[1] Among published papers on the local application of bromine in hospital gangrene may be mentioned *Bromine in Hospital Gangrene*, by R. L. STANFORD, M. D., Surgeon U. S. V., in *Am. Med. Times*, 1863, Vol. VII, p. 24, and *Remarks on Hospital Gangrene*, by Surgeon G. R. WEEKS, U. S. V., in *Am. Med. Times*, 1863, Vol. VII, p. 46. GOLDSMITH (M.), *A Report on Hospital Gangrene*, etc., Louisville, 1863. THOMSON (WM.), *Report of Cases of Hospital Gangrene treated in Douglas Hospital*, Washington, D. C., in *Am. Jour. Med. Sci.*, 1864, Vol. XLVII, p. 378.

CASE 74.—Private H. Barr, Co. I, 21st Iowa, aged 43 years, was wounded at the Black River Bridge, May 17, 1863, and was transferred from a field hospital to Memphis, two weeks after the injury. Acting Assistant Surgeon W. M. Dorran contributed the following history: "He received a flesh wound of the right leg, the ball entering about two inches below the head of the fibula, external aspect, passing inward and downward behind the bones of the leg, and escaping three inches below the head of the tibia, internal aspect. On June 4th, he was admitted into the Jackson Hospital, in this city. The wounds were then small, the external one nearly healed; both wounds were suppurating, and the pus was 'darkish,' the patient stated. Either pus burrowed or a diffuse abscess formed six inches below the internal wound on the calf of the leg, pointed and broke there, discharging a considerable quantity of pus. The tissues all around this new sore began to slough, and a destructive process extended down to within two inches of the ankle, up to the internal wound, forward to the spine of the tibia, and backward to the median line of the muscles of the calf. A consultation was held over the case, and it was decided to amputate, the patient states; but the superintendant of the hospitals happened to be present and overruled the decision, and had the patient transferred to the gangrene section of this, the Union Hospital, on June 30th. On admission, a large portion of black dead tissue surrounded the breach of the surface, which, when cut away by the scissors, made the ulcer to be about eight inches long and four inches in width at the middle of the leg. The tibia was denuded of periosteum to the extent of four inches in its middle third. The internal saphenous vein was a black cord for about six inches. The gastrocnemius and soleus muscles had sloughed to the median line, and the fascia between these two muscles, and also under the soleus, had sloughed away much farther in extent than the muscles. After it was cleaned as well as possible by cutting and washing, fuming nitric acid was applied, or almost poured on the dead and dying tissues still remaining, and with a piece of wood it was worked into their structure, and the semifluid slush or mud was cleaned away, as it formed, by the application of the acid. Then the whole leg was enveloped with a poultice of charcoal and linseed-meal, covered by an oilcloth, and bandaged from the toes to the knee. After the cauterization, when the patient was under the influence of some stimulants and morphia given to him during the operation, he expressed himself as feeling better than he had for two weeks past, and the leg easier. July 1st, Sloughing by acid not ready to be removed yet; acid again applied where gangrenous ulceration still proceeded, also the poultice and tight bandage. July 4th, The patient rests well at night, and his appetite is rather improved. He is cheerful and hopeful, and of the opinion now that there is a chance of his leg being saved, whereas before he had made up his mind that it was to be lost. The slough by the acid was removed to-day, and the sore is fresher in appearance anteriorly, but posteriorly the fascia is still sloughing. The strong acid was again applied in this region, causing the formation of a mass to be cleaned away to the amount of two or three ounces. Lint saturated with a solution of bromine and bromide of potassium is now introduced into every crevice and sinus and over every sloughing part, and over this a poultice and bandage. Stimulants are given four times a day, also tonics of quinine and tincture of chloride of iron. July 8th, By assiduous attention to treatment, after the manner already described, the sore has been brought to present a fresh and rather healthy base, and some granulations are springing up on the anterior part. Nitric acid has still to be applied under the muscles of the calf, and at the lowest margin of the ulcer some dead tissue remains. July 12th, The ulcer is quite clean and has quite a healthy appearance; granulations are springing up very beautifully, except at the lower margin. The patient's general condition has improved. Resin cerate is used to dress the parts where granulations are springing up, but solution of bromine or Labarraque's solution where any unhealthy appearance presents itself. July 16th, The sore appears quite healthy and granulating all over. The muscles that were separated from each other by destruction of tissue between them are beginning to grow together. The tibia, which was bare for some distance, is again being covered by granulations. The edges of the ulcer are becoming depressed and rather inverted instead of being indurated and everted. The internal saphena vein has been destroyed for eight inches of its length and cut away. There was no hæmorrhage at any time. September 1st, Ulcer very much reduced in size. Nitrate of silver is used at times to depress exuberant granulations. October 1st, Wound almost completely healed, and patient able to walk about." He was discharged April 6, 1864, and pensioned. Examiner R. S. Lewis, of Dubuque, Iowa, certified, June 16, 1864: "The right leg has been pierced by a ball about three inches below the knee, * * * followed by gangrene; is still discharging, leaving the limb useless." This pensioner was last paid September 4, 1868, since when he has not been heard from.

The pathology and treatment of gangrene of the lower extremities will be considered in the chapter on the general subject. In the lower limbs traumatic gangrene is usually of the humid variety and commonly progresses with great rapidity.

Tetanus.—Among cases of shot wounds of the lower extremities not attended by lesions of the bones, joints, great vessels or nerves,[1] there were one hundred and seventeen

[1] Surgeon J. JULIAN CHISOLM, C. S. A., in his *Manual of Military Surgery for the use of Surgeons in the Confederate States Army* (Columbia, S. C., 3d ed., 1864, p. 257), observes that the results described by LARREY in his campaigns in Egypt and Germany (*Mémoires de Chir. Mil. et Campagnes*, Paris, 1812. T. III, p. 286), in the frequent appearance of tetanus in wounded soldiers upon exposure on battle-fields to cold and damp night air, never followed the leaving of wounded soldiers upon the battle-fields of the Confederacy. Dr. EDWARD WARREN, Surgeon General of the State of North Carolina, declares (*An Epitome of Practical Surgery for Field and Hospital*, Richmond, 1863, p. 132) that "the experience of all surgeons establishes the fact that changes of temperature are prolific sources of this disease;" and Professor SAMUEL D. GROSS (*A System of Surgery, etc.*, 5th ed., 1872, Vol. I, Chap. X, p. 238) remarks that gunshot wounds are peculiarly liable to be followed by tetanus only when the sufferers are neglected, or permitted to lie upon damp, cold ground, or in currents of cold air, after an engagement. Dr. CHISOLM says (*l. c.*, p. 258) that "a trifling puncture or scratch is, at times, sufficient to cause an attack; and it has been noticed by military surgeons that the scraping of the skin by a ball, with bruising of the nerves, is more liable to this complication than the more severe wounds." "Wounds in certain situations," Dr. CHISOLM adds, "are thought to favor its appearance, viz: injury to the hands, *feet, joints*, etc." . . "Its common period for appearing is between the fifth and fifteenth days." Professor JOS. JONES, Surgeon P. A. C. S., in an article on *Traumatic Tetanus*, in *Confed. States Med. and Surg. Jour.*, 1864, p. 1, dwells upon the good effects of chloroform mixture, administered by the stomach, in shot flesh wounds. The compilers of *A Manual of Military Surgery prepared for the use of the Confederate States Army*, Richmond, 1863 [Surgeons A. TALLEY, W. F. CAMPBELL, ST. GEORGE PEACHEY, A. E. PETICOLIS, and J. DUNN are reported to have constituted the commission that prepared this work], in the chapter on *Tetanus*, on page 9, refer to the effect of draughts of cold air in determining violent exacerbations of muscular rigidity.

cases of tetanus noticed, with one hundred and six deaths, or 90.5 per cent. An example of one of the eleven instances of recovery is appended:

CASE 75.—Private G. C. Nichol, Co. C, 22d Iowa, aged 20 years, was wounded at Vicksburg, May 22, 1863. Surgeon T. F. Azpell, U. S. V., noted his admission to the Steamer R. C. Wood, from a field hospital, June 4th, with "shot wound of right thigh." Assistant Surgeon J. M. Study, U. S. V., reported the following history from Union Hospital, Memphis, where the patient was admitted June 8th: "The injury for which this man was admitted was an ordinary flesh wound, the ball passing transversely from without inward, through the posterior aspect of the right thigh. At the time of his admission the wound showed no indication of having made any progress toward reparation, but presented an extremely irritable margin. Warm-water dressing was applied, and on the following day there were marked symptoms of tetanus, chiefly confined to the jaws, which, however, soon became more general, and in addition to the trismus there was that frightful condition of the body intermediate between opisthotonos and pleurothotonos. Sufficient quantity of chloroform was administered by inhalation, to produce complete anæsthesia, twice regularly in twenty-four hours. Sulphate of morphia, in half-grain doses, was given each evening at bed-time, and brandy ad libitum. June 11th, no notable change in the case; patient is stupid, and there is an absence of muscular rigidity as long as the combined effects of the chloroform and morphia continue. June 14th, patient much in the same condition as when last noted, excepting an extensive tumefaction of the left limb, which tumefaction, so far as the most careful scrutiny would show, is entirely idiopathic in its nature. A roller was applied to this limb from the toes to the groin; otherwise the treatment of the case is the same. June 18th, tetanic symptoms subsiding somewhat; the wound has changed in appearance but little since first noted; tumefaction in left leg still present. Chloroform is given less freely than before; morphia continued the same, also the brandy. June 21st, patient is now able to separate the jaws to the width of half an inch; his general condition is improving rapidly; appetite is ravenous; the bowels are regular; swelling in left leg disappeared; wound beginning to suppurate. Morphia, in one-third doses, is given at bed-time; brandy, one ounce every two hours. June 28th, the wound has been suppurating freely, a large amount of the adjacent tissues having sloughed away. The warm-water dressing, which has been continued until now, is stopped, and scraped lint moistened with glycerine is applied. Patient takes one pint of ale daily. July 15th, the wound is quite healed, and the patient walks with the aid of a cane. On August 19th, he was furloughed." The registers of the Union Hospital show that this man returned from furlough, and was sent to his regiment for duty September 30, 1863.

Two examples of fatal cases are subjoined. It has been impracticable to discover any details of autopsies throwing any light on the subject.[1] Apparently there were no instances recorded in this group in which microscopical examinations of sections of the spinal cord were undertaken:

CASE 76.—Private P. Brown, Co. A, 169th New York, aged 36 years, was wounded at Cold Harbor, June 3, 1864, and admitted to Harewood Hospital, Washington, five days afterwards. Surgeon R. B. Bontecou, U. S. V., reported: "Shot flesh wound of left leg. Patient furloughed July 29th." Assistant Surgeon M. F. Coggswell, U. S. V., in charge of the Albany Hospital, reported the following result of the case: "The patient was admitted August 1st, having a large ulcer, measuring six by five and a half inches, on the calf of the leg, the result of a gunshot wound. His general health was very poor, and he was anæmic and debilitated. Gangrene had appeared previous to his admission to this hospital, and the ulcer was indolent, foul, and unhealthy. Nitrate of silver was applied and solution of chlorinate of soda, also poultices of flaxseed-meal mingled with pulverized charcoal. This treatment was followed in twenty-four hours by a healthy discharge of pus and a general improvement of the ulcer. Beef-tea, milk-punch, and extra diet were ordered. On the 2d of August his tongue was red and dry, his appetite failed, and he manifested great uneasiness and appeared to labor under an impression of impending evil. That night (August 2d) the weather, which had been very hot and dry for several days, suddenly became damp and chilly, and on the morning of August 3d, at 4 o'clock, symptoms of trismus appeared, and were followed in two hours by a general spasm of all the voluntary muscles. The *risus sardonicus* was marked, and the patient was in great distress; deglutition was impossible. Beef-essence and milk-punch were administered by enemata, and half a grain of sulphate of morphia was injected hypodermically over the epigastrium. The latter acted so speedily and powerfully that in two hours all the muscles were relaxed. The patient's strength, however, was completely exhausted, and at 8 o'clock P. M. he expired, there being no recurrence of the tetanic symptoms. No general *post-mortem* was made; a local examination did not reveal anything. The trunk of the posterior tibial nerve was intact, but its muscular and cutaneous branches were involved."

CASE 77.—Sergeant W. Walters, Co. B, 87th Pennsylvania, aged 29 years, was wounded at the Wilderness, May 8, 1864. Surgeon N. R. Moseley, U. S. V., reported his admission to Emory Hospital, Washington, May 16th, with "shot wound of foot." Surgeon J. H. Taylor, U. S. V., reported the following result of the injury: "The patient was admitted to Summit House Hospital, Philadelphia, May 20th, having been wounded by a ball striking the plantar surface of the left foot at the first interosseous space, one and a half inches from the metatarso-phalangeal joints, going directly through on the dorsum and producing a flesh wound. Cold-water dressings were applied. The patient is of strumous diathesis, having scars on the side of his neck, the remains of scrofulous abscesses. May 30th, at 8 A. M., he was in excellent health; at 12 M. he complained of stiffness and pains in the jaws and neck; great pain, referred to articulation of left inferior maxilla with temporal bone, together with constant fixed pains at the epigastrium, shooting around to the spine; jaws seemingly tied, as the patient expressed; mouth gradually closing; twitching of facial muscles; some difficulty of respiration, but none of deglutition.

[1] CHISOLM (J. JULIAN), M. D., (in his *Manual of Military Surgery*, 3d ed., Columbia, 1864, p. 259) states: "That fruitful source of information, pathology, gives us no instruction in this disease. An autopsy reveals to the eye nothing commensurate with the intensity of the symptoms. A slight congestion of the spinal cord and medulla oblongata is all that can be discerned."

Treatment: Bowels unloaded by injections; brandy and quinine given in large quantities, milk-punch and beef-tea by mouth and rectum. Liquor of morphia, one half ounce, was given every two hours for eight or ten hours, but with no effect. Injected one grain of sulphate of morphia, dissolved in one drachm of water, hypodermically just over the temporal region; but even this failed to produce any narcotic effect. Counter-irritation was used at the spine with chloroform and covered with oiled silk, but so severe was the burning pain that it soon had to be discontinued. On May 31st, the patient was attacked with severe cramps in the abdomen, the muscles here becoming hard and tense, the muscles of the back rigid and prominent; great pain, referred to chest in inspiration; pupils contracted. There was profuse perspiration over the entire body from the commencement of the disease; pulse natural. A solution of sulphate of atropia, one grain to an ounce of water, was now injected, in quantities of one drachm, a little to the left of the median line of the neck at first, and subsequently on each side of the spine, below the scapula, at intervals of one half, one, and two hours, in all seven or eight times. The pupils were now dilated, but there was not the slightest relaxation of muscular spasm; perspiration still profuse. An effort to rouse him from this state with cold douche had but little effect. The spasms continued to increase in frequency and violence until 3 A. M. on June 1, 1864, when he died."

Extraction of foreign bodies, removal of all causes of irritation to the wound, avoiding cold and currents of air, were the prophylactic measures advised. Anæsthetics and narcotics were generally employed, but in grave and confirmed cases the therapeutical results were most discouraging.

Erysipelas.—In forty-five cases, of which thirty-four proved fatal, extended erysipelatous inflammation was the most characteristic feature. An example of recovery from this complication is detailed:

CASE 78.—Private *W. Bowling*, Co. B, 1st Maryland Cavalry, aged 22 years, was wounded at Gettysburg, July 4, 1863, and entered the Frederick Hospital two days afterwards. Acting Assistant Surgeon W. S. Adams reported: "The patient was wounded by a minié ball which entered two inches above the right patella, passing downward, striking that bone and glancing, and came out at its lower border, without causing fracture or involving the joint. The patient's general health was good. Cold-water dressings were ordered, and rest. July 20th, evidence of erysipelas appeared this morning; bowels constipated; pulse quick. Ordered lead and opium wash to the knee joint, and gave three compound rhubarb pills. 21st, bowels open freely; pulse less frequent; tongue furred, with red edges and tip; skin dry; loss of appetite; erysipelas extending above and below the wound. Applied tincture of iodine around the limb beyond the disease. 23d, erysipelas extending rapidly; considerable gastric irritation; pulse quick but feeble. Ordered one pint of milk-punch a day, and three grains of quinine three times a day. 24th, erysipelas still extending and now occupying the entire right leg and thigh, and the pelvic region down the left thigh as far as the knee; right limb very œdematous and assuming a decided phlegmonous character. Evaporating lotions of ether were ordered to the worst points, and the other treatment continued. 30th, erysipelas still extending up the body and now occupies the entire left limb. It has subsided in its original seat, and desquamation has taken place. Numerous longitudinal incisions, extending from the instep to the toes of the left foot, were made to relieve the tension. Stimulants were increased to one pint of whiskey per day, and beef-tea and generous diet pushed as far as possible. August 2d, general condition much better, but erysipelas still continues on the feet and ankles, and there is some sloughing of the integuments over the metatarsus of the left foot owing to the incisions not having been made in due time. August 6th, condition still improving; erysipelas has nearly disappeared. 9th, decidedly convalescent; ulcer of left foot granulating finely; appetite good. 30th, ulcer entirely healed; wound of knee nearly so. October 13th, wounds entirely healed, and patient this day transferred to Baltimore." Surgeon T. H. Bache, U. S. V., reported that the patient was paroled from West's Buildings Hospital November 12, 1863.

The graver cases of erysipelas complicating flesh wounds were pernicious and contagious:

CASE 79.—Private L. Brittin, Co. M, 1st Pennsylvania Cavalry, aged 35 years, was wounded at Hanoverton, May 28, 1864, and admitted to the field hospital of the 3d division, Fifth Corps, where Surgeon L. W. Read, U. S. V., noted "a shot wound of leg." From the field hospital the patient passed to Washington and thence to Philadelphia, entering the Summit House June 28th, and subsequently the Satterlee Hospital. Surgeon I. I. Hayes, U. S. V., recorded the following history: "The injury was caused by a minié ball passing transversely and producing a slight flesh wound of the upper third of the right leg. The wound healed, when it was attacked by gangrene, and after again becoming healthy the whole limb was seized with erysipelas. On March 24, 1865, the whole external lateral surface of the knee presented two sloughing wounds, one on a line with the head of the tibia, the other just above the tendon of the muscle. The whole limb was swollen, red, and painful. General condition poor, with headache, fever, dry tongue, and dry hot skin. On March 26th, a large collection of pus, amounting to about six ounces, was evacuated immediately below the patella. The patient's bed was moved, the old splint removed and a Smith's anterior applied. On rinsing the limb a sloughing wound involving nearly the whole popliteal space was found. On the following day the patient was slightly more comfortable, but there was not much change in his general condition. On March 31st, there was no change in the appearance of the wound, but the patient's strength was evidently becoming exhausted. There were symptoms of pyæmia, and he was delirious during the afternoon, but better toward evening. His pulse was 120 and very small; countenance sunken, with hectic spots on the cheeks. He complained of no pain, but was evidently partially unconscious. He died April 6, 1865."

Hæmorrhage.—In addition to the group of cases of shot flesh wounds of the lower limbs with primary lesion of the large blood-vessels, as discussed on pp. 13, 18, *ante*, one

hundred and fifty cases have been noted—and this is probably an imperfect summary—of consecutive bleeding from the large vessels, among which were sixty-four examples of recovery, eighty deaths, and six cases with unknown results, a mortality rate of 55.5. Consecutive bleeding was from vessels varying in magnitude.[1] Tabulations have been made showing the time from the reception of the injury to the onset of the bleeding, the amount of blood lost, and the treatment, but there is not space to reproduce this analysis. Two illustrative cases are appended:

CASE 80.—Private J. C. Corliss, Co. G, 17th Illinois, aged 21 years, was wounded before Vicksburg, May 19, 1863, and entered the Jackson Hospital at Memphis eight days afterwards. Acting Assistant Surgeon H. D. Garrison recorded the following description of the injury and its result: "A conical ball entered the left thigh anteriorly, about five inches below Poupart's ligament, passing upward and slightly inward in its course. The wound was examined at the time by a surgeon, who was unable to extract the ball. When admitted to this hospital the man was in good health, and his wound gave him but very little pain. Water dressings were applied and all went well until about noon on the 28th, when, from some slight motion, copious hæmorrhage commenced suddenly. The femoral artery was almost instantly compressed over the pubic arch, but not until much blood was lost. A consultation being called, it was believed that the profunda femoris was probably severed, and that a tourniquet with a small roller for a pad placed over the track of the ball would probably be sufficient to prevent the recurrence of hæmorrhage until nature had time to permanently close the vessel. This plan was accordingly adopted and proved successful for twenty-four hours, when—while Surgeon E. M. Powers, 7th Missouri, in charge of the hospital, was looking at the appliance and congratulating the patient on his safety—the hæmorrhage again set in with all its former force. On consultation it was then agreed to inject the wound with solution of persulphate of iron, which was accordingly done, and the tourniquet was re-applied. No further hæmorrhage occurred afterwards, but in spite of stimulants freely administered the patient expired fourteen hours after the last attack. The *post-mortem* examination revealed the fact that the femoral artery was opened about an inch below the origin of the profunda. The opening was about the size of a small pea and seemed to have been caused by the sloughing of the coats. In this case the pulsation of the tibial and popliteal arteries demonstrated that the flow of blood through the femoral was uninterrupted and led to the adoption of an erroneous diagnosis." Surgeon Powers in his report stated that the loss of blood in this case amounted to four and a half pints, also that the bullet was extracted from its place of lodgement after the patient's admission to Jackson Hospital.

CASE 81.—Private A. Kunkle, Co. B, 62d Pennsylvania, aged 18 years, was wounded at Gettysburg, July 2, 1863, and remained at a field hospital for two weeks, when he was transferred to Baltimore. Acting Assistant Surgeon J. Dickson made the following report from Jarvis Hospital: "He was wounded through the right thigh, the missile entering near the tuberosity of the ischium, and, passing about fourteen inches through the deep muscles, emerged outside of the femur four inches from the knee. He stated that he bled very freely on the field, and after being taken to a neighboring house there was a recurrence, lasting all night. No further hæmorrhage occurred until the patient was brought to this hospital. At that time he was very anæmic and feeble. Generous diet and iron were ordered. On July 17th, an alarming hæmorrhage occurred from both wounds, which was arrested by compression and the local application of persulphate of iron. Two days afterwards there was another hæmorrhage as profuse as before, and the same treatment was resorted to with the same result. On July 28th, there was a recurrence nearly as profuse as the last. Amputation and ligation of the femoral artery was thought of; but it was concluded he would die after either, and compression upon the femoral and along the course of the wound was resorted to. On July 30th, the patient was rallying. On August 6th, another slight hæmorrhage came on, followed by a discharge of sanious pus, the contents of an aneurismal sac. By August 29th the wounds had almost healed and the patient quite built up and walking on crutches, his leg being considerably contracted but straightening gradually." In October following the patient was transferred to the Satterlee Hospital, Philadelphia, and subsequently to Pittsburg, whence he was returned to his regiment for duty February 12, 1864. The Adjutant General of Pennsylvania reports that the man was mustered out with his command July 13, 1864. He is not a pensioner.

Ligations of Blood-vessels of the Lower Limbs after Flesh Wounds.—At page 16 it will be recollected that attention was called to a considerable number of cases of direct injury of blood-vessels treated by primary or consecutive ligation, and that it was promised that further on such examples would be enumerated, together with cases of deligation of the same vessels for flesh wounds without primary arterial lesion. The series which will be here presented numbers one hundred and ninety-five instances,—one hundred and ninety-four ligations of arteries and one of the saphenous vein. It will be noticed, however, that among the hundred and ninety-four cases of arterial ligations there were six instances in which the femoral vein was simultaneously tied with the artery it accompanied.

[1] An analysis of the series shows 1 fatal case of bleeding from the external iliac; there were 23 cases of hæmorrhage from the femoral, with 18 fatal results, 3 recoveries, and 2 unknown. The hæmorrhages from the profunda, circumflex, and other branches were 19 with 5 deaths. There were 13 cases of secondary bleeding from the popliteal with 8 deaths; 6, of bleeding from the anterior tibial with 1 death, and 15 of the posterior tibial with 9 deaths. It is hardly necessary to follow out the statistics of the smaller vessels. There were 13 cases of profuse venous hæmorrhage of which 10 were fatal. This includes 4 cases of bleeding from the femoral veins, all of which were fatal.

A fatal instance of *deligation of the common iliac artery* is first detailed, constituting one of the six instances in which this operation was practised during the American civil war. This operation now (1877) foots up sixty-one cases with forty-eight deaths:

CASE 82.—Private J. Bouer, Co. I, 48th Pennsylvania, aged 19 years, was wounded at Tolopotomy Creek, May 31, 1864, and admitted to the field hospital of the 2d division, Ninth Corps. Surgeon J. Harris, 7th Rhode Island, noted, "shot flesh wound of both thighs by a minié ball." Four days after being wounded the man entered Judiciary Square Hospital, Washington. Assistant Surgeon A. Ingram, U. S. A., corroborated the above description of the injury, and reported the result as follows: "Disorganization of tissue from a deep flesh wound; hæmorrhage took place on June 10th, from the small vessels, and was controlled by pressure, but recurred on June 15th, when the femoral artery was taken up at Scarpa's triangle. This vessel was again ligated, on June 18th, at Poupart's ligament; hæmorrhage again occurred on the morning of June 22d, when the common iliac was ligated. The patient died during the day." The report does not show which of the two limbs was operated on, and diligent search has revealed no additional record of the particulars of the case.

The reader may compare, on page 333 *et seq.* of Volume II of Part II, the details and comments on four other examples of ligation of the common iliac artery practised during the War, two for shot wounds of the pelvis and two on account of aneurisms arising from punctured wounds. Yet another instance of unsuccessful ligation of the common iliac artery for consecutive hæmorrhage after a shot wound of the pelvis has been recorded by Medical Inspector F. H. Hamilton, U. S. A. The particulars, so far as they can be ascertained, are stated in the foot-note.[1]

Ligations of the External Iliac Artery.—In four of these examples ligatures were placed at first on this trunk, but in the seven remaining cases after the femoral had been tied.

CASE 83.—Private G. W. Husk, Co. F, 1st Maryland Cavalry, aged 47 years, was wounded at Deep Bottom, August 16, 1864. Assistant Surgeon C. Wagner, U. S. A., reported,[2] from the hospital at Beverly, New Jersey: "Admitted from City Point with a gunshot flesh wound of the upper third of the right thigh. Bleeding occurred from the femoral artery on November 10th, fifteen ounces of blood being lost. The patient was feverish, pulse 130, appetite wanting. Acting Assistant Surgeon J. C. Morton administered chloroform and ligated the external iliac artery. The patient died November 17, 1864, from recurrent hæmorrhage."

CASE 84.—Private *J. H. Gatewood*, Co. F, 21st Georgia, aged 32 years, wounded at Manassas, August 28, 1862, Surgeon J. Chambliss, P. A. C. S., reported:[3] "Small ball entered just behind the left trochanter, passed out below the perineum, entered the right thigh opposite, and emerged at the external aspect at middle of upper third of the thigh; bleeding was profuse for several minutes. Aneurism of the femoral artery; digital compression repeatedly used without avail. January 31, 1864, ligation of the external iliac artery, pretty much after Cooper's method, by Surgeon Jackson Chambliss, P. A. C. S. February 3d, erysipelatous inflammation subsided. February 15th, the wound presented a healthy granulated appearance and discharged healthy pus. He continued to improve until February 17, 1864, when violent arterial hæmorrhage occurred, from which he died in a few minutes."

---

[1] Professor FRANK HASTINGS HAMILTON, A. M., M. D., LL. D., in *The Principles and Practice of Surgery*, New York, 1872, in treating of ligations of the common iliac, states, at page 232, that: "On the 15th of May, 1864, after the battle of the Wilderness, I tied the same vessel in the presence of Dr. WALSER and my student Mr. HOYN. The patient, John E. Preston, of the 19th Pennsylvania Vols., had been wounded by a rifle-ball which had traversed the pelvis, and the operation was made to arrest a hæmorrhage which had already nearly proved fatal. He died on the following day, but without a recurrence of the bleeding." In editing the surgical report in *Circular* No. 6, S. G. O., 1865, p. 78, I cited from the records but three cases of ligation of the common iliac practised during the American civil war,—the operation on the left common trunk by Surgeon J. COOPER MCKEE, U. S. A., for hæmorrhage after shot wound of the pelvis (which afforded the specimen 3464, Sect. I, A. M. M.), and the operations by Acting Assistant Surgeon R. N. ISHAM of Chicago, and J. B. CUTTER of Newark, for aneurisms consequent on stabs. In the seventh chapter of Volume II, of Part II, of the *Medical and Surgical History of the War*, pp. 233–6, these three cases of ligation of the common iliac artery were detailed, and a fourth operation of ligation of this trunk for hæmorrhage following shot injury, in the case of Colonel J. R. Scott, 19th Illinois, was quoted from the report of the operator, Professor D. BRAINARD, in the *Chicago Medical Journal*, 1864, Vol. XXI, p. 97, and reprinted in the *Am. Jour. Med. Sci.*, 1864, Vol. XLVII, p. 565. The operation of ligation of the common iliac for hæmorrhage after shot flesh wound of the lower extremity reported above (CASE 82) by Assistant Surgeon A. INGRAM, U. S. A., is the fifth, and the case adduced by Professor F. H. HAMILTON is the sixth, example of the war-series of this important procedure. From Professor HAMILTON'S printed report of the case of Preston I was unable to trace the injury upon the records, as there is no mention made of it either in the 19th or 119th Pennsylvania Volunteers; but after repeated diligent search the original manuscript entry of the case was found on the field register of the 3d division of the Sixth Army Corps hospital, at the Baptist Church, Fredericksburg, Virginia. It is there stated that Corporal John E. Preston, of Co. G, 119th Pennsylvania, was wounded at the battle of the Wilderness, receiving a "gunshot injury of the anterior superior spinous process of the left ilium." The precise date and extent of the injury is not noticed, nor the disposition made of the patient; but, in a list of deaths in the 3d division hospital, Sixth Corps, at the Baptist Church, Fredericksburg, the death of Corporal John E. Preston, on May 14, 1864, is recorded. In another part of the register, signed by Dr. J. W. WALSER, is a list of operations performed at Baptist Church Hospital after the battle of the Wilderness, by Drs. HAMILTON and BUCK, which comprises: "One ligation of the common iliac,—death in twenty-four hours." The data are very imperfect, but the probabilities are, from the documentary evidence accessible, that Corporal Preston, 119th Pennsylvania, was struck, on May 7th, at the Wilderness, by a musket ball which fractured the anterior superior spinous process of the left ilium, and that he was sent to Fredericksburg by the hospital trains that reached that town on May 11th. Further, that uncontrollable hæmorrhage arose, and that Medical Inspector F. H. HAMILTON, U. S. A., ligated the left common iliac artery on May 13th, and that the fatal termination of the case took place twenty-four hours afterwards, May 14, 1864.

[2] See *Report on Interesting Surgical Operations performed at the Hospital at Beverly, N. J., by Assistant Surgeon* C. WAGNER, U. S. A., 1864, p. 13.

[3] CHAMBLISS (J.), *Case of Traumatic Femoral Aneurism—Treated by Digital Compression—Ligation afterwards of the External Iliac Artery*, in *Confed. States Med. and Surg. Jour.*, 1864, Vol. I, p. 97.

CASE 85.—Private J. R. Spaulding,[1] Co. F, 112th New York, aged 23 years, was wounded at Fort Fisher, January 15, 1865. Assistant Surgeon S. H. Orton, U. S. A., reported, from McDougall Hospital, New York Harbor: "A minié ball entered the upper and inner aspect of the left thigh, and, passing a little downward and outward, emerged near the knee, apparently avoiding the bone and all important vessels. Simple dressings were applied for about three weeks, when the wound began to look unhealthy and had a tendency to slough. Solution of the permanganate of potash was freely used and tonics given. On March 23d, hæmorrhage occurred from the posterior wound and was arrested by sulphate of iron and pressure. On March 31st, bleeding commenced from the anterior wound. Dr. Orton applied a ligature to the external iliac artery. On April 21st, the hæmorrhage recurred from the anterior wound, probably through the collateral circulation, which in the meantime had become established. The bleeding was successfully restrained by the application of the horse-shoe tourniquet, which was kept constantly retained for the space of two weeks, when it was omitted without any subsequent recurrence of the hæmorrhage. At this time the patient was greatly afflicted with bed-sores, which were a source of great annoyance and sufficient to exhaust his strength. The wounds, however, were healing kindly. On May 31st, the patient was attacked with dysentery, which, in his enfeebled condition, resisted all efforts at once. The patient continued to sink under this complication, and died June 15, 1865, five months after the receipt of the original injury and about two and a half months after the operation of ligating the artery. At the time of his death the wounds were nearly healed."

The fourth case of this group is that of Private *J. Langford*, printed in full in the *American Medical Times*, 1863, Volume VI, page 256. A somewhat extended abstract of this interesting case is here appended:

CASE 86.—Private *J. R. Langford*, Co. F, 10th Georgia, was wounded at Antietam, September 17, 1862. Assistant Surgeon R. F. Weir, U. S. A., reported from the hospital No. 1, Frederick, that the patient entered that hospital October 27th. He had been struck by a musket ball which entered half an inch below Poupart's ligament, below the right groin, just over the vessels, and made its exit on a line with the right tuber ischii, about two inches and a half behind it. Profuse immediate hæmorrhage of arterial color produced syncope, and there was recurrent bleeding when the fainting was over. The patient was confined to his bed only about a week, and, by September 27th, both orifices had cicatrized. When he left his bed the thigh was flexed on the pelvis, extension causing pain. On October 27th, an examination revealed an aneurismal pyriform tumor in the right groin, its apex directed toward the scrotum and the greatest transverse diameter corresponding with Poupart's ligament. At the base its diameter extended to the vessels about four and a half inches; at the apex, internal to the vessels, and about three inches external to the vessels. Starting from Poupart's ligament, the tumor extended in its outer portion three fingers' breadth toward the anterior superior spine, and in the iliac fascia it extended a similar distance. Near the cicatrix of the wound of entrance the aneurismal thrill was very distinct. The patient said he perceived this thrill since he had been able to go about. The prominence of the tumor was moderate. The limb was flexed on the pelvis at an angle of about 45°. Neuralgic pains affected the anterior surface of the thigh and bitterly increased in its intensity. Pressure on the aorta or external iliac completely arrested pulsation. The pulsation of the posterior tibeal at the ankle was feeble. The patient was of fine physique, and reported himself as in excellent health prior to injury. By November 5th the tumor had rapidly augmented in bulk, and, after consultation, it was determined to operate by Syme's method on the following day. The measures proposed contemplated compression on the right common iliac, an incision through the cicatrix of the wound of entrance sufficient to introduce the left index, and feel and plug the original opening into the artery, then to freely lay open the sac and ligate the vessel above and below the point of injury. November 6th, at noon, patient was placed under ether. A straight incision two inches long, starting from just within the middle of Poupart's ligament and running obliquely downward along the thigh, was made. The upper end of this opening was prolonged by a curved incision one and a half inches long, running upward and outward as far as the ligature of the external iliac artery. This incision was deepened through the superficial fascia, and the knife being then laid aside, the dissection was carried on by means of the handle of the scalpel and the finger nails. The lymphatic of the saphenous opening was thus brought into view, immensely enlarged, congested, and pushed upward. The aneurismal tumor was found to have partially forced its way through this opening, overlapping its upper edge like a femoral hernia. Commencing at the inner margin of this opening the dissection was carried on without much difficulty to Poupart's ligament, which was found very tense, and the artery could be felt beating just beyond. The upper end of the incision was then prolonged one inch toward the umbilicus, and after dividing the tendons of the external oblique on a director, the ligament was divided directly over the artery by blunt-pointed scissors. The sheath of the artery was soon brought plainly into view and its covering pushed up to one-half inch beyond the epigastric and circumflex arteries, at which point a ligature was placed around from within outward by means of a Mott's aneurismal needle. The effect of ligation was to arrest pulsation in the tumor. The curved wound was closed by means of silver interrupted sutures. One small artery, the superficial epigastric, required ligation. Not more than one ounce of blood was lost during the operation. The limb was enveloped in cotton batting. An anodyne was given after recovery from the anæsthetic, and repeated at midnight. At 4 o'clock P. M. the patient was quiet; pulse 120, temperature of sound limb 93, of limb operated upon 95 in popliteal space. November 7th, patient passed a quiet night, though sleeping but little, and states that the neuralgic pains have ceased. In a paper on *Hospital Gangrene*, by Acting Assistant Surgeon A. North, printed in the

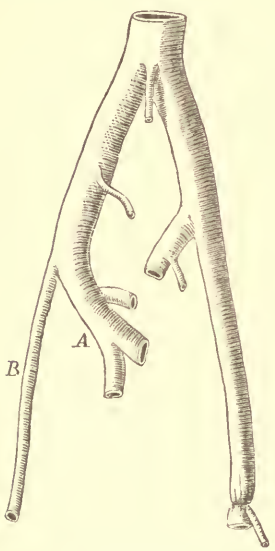

FIG. 14.—Ligation of right external iliac for shot injury. *Sp.* 3986.

[1] The case is briefly noted by Surgeon J. A. LIDELL, U. S. V., *Gunshot Wound of Thigh, etc.*, in *Surgical Memoirs of the War of the Rebellion, coll. and pub. by the U. S. San. Comm.*, 1870, Surgical Vol. I, p. 231.

American Medical Times, 1863, Volume VI, p. 257, the sequel of the history is given: "The operation was successful, and in two weeks the wound was nearly healed, when it took on an unhealthy action, and patient then complained of a burning pain in it. Anticipating what was coming, he was immediately moved to a stone building where there had previously been no gangrene; and here, November 21st, he came under my care. He remained here for four days before the disease became sufficiently developed to justify his removal to the gangrene tent. November 25th, patient is very desponding, and is growing weaker day by day; has considerable headache; pulse 120 and almost imperceptible; tongue furred, brown, tip and edges red and dry. The ulcer, which is three inches in width, extends from the pubes up nearly to the anterior spine of the ilium; has an unhealthy and sloughy appearance. Patient complains of a slight burning pain in wound, the edges of which are everted, jagged, and undermined for about two inches; the integument is indurated and tumefied, and extremely sensitive to the touch or the least movement of the limb; characteristic odor not well marked. The sinuses extending under the integument were freely laid open and the surface of the ulcer scraped with a spatula, to which the acid was first applied with a mop, and then worked in with a stick so as to get it down to the comparatively healthy tissue, and was also applied in a similar manner to the tissue surrounding the ulcer, to destroy, in this way, both the cuticle and cutis vera and thus to limit the extension of the disease. Superficially antiseptic poultices were applied, and opiates given to relieve pain; takes half an ounce of brandy and beef-tea every half hour. November 26th, although the pain following the application of the acid was so severe as to cause slight convulsions for a time, patient is feeling better to-day; pulse 108 and gaining in strength. Fearing that the progress of the disease has not been entirely arrested, the acid was again thoroughly applied. Takes stimulants and tonics, with fifteen grains of tartrate of iron and potass three times a day. November 28th, the black, charred slough has separated, revealing a healthy, granulating surface beneath. The extreme sensitiveness to the touch, together with the induration and swelling of the surrounding parts, has almost entirely disappeared; applied oakum saturated with acid wash to the ulcer. December 5th, patient represents himself as feeling much better; mind hopeful and cheerful; appetite good; ulcer is cicatrizing rapidly; continue stimulants and tonics. December 15th, all unfavorable symptoms have disappeared and patient is regarded as convalescent. For two months after this date patient was up and about the ward, when secondary hæmorrhage, following sloughing of the sac, supervened, and in four days resulted fatally," March 15, 1863. Assistant Surgeon R. F. Weir's notes state that a sudden change occurred on February 25th, when, in the evening, the patient had high fever; pulse 140 and almost imperceptible. On February 27th, considerable pain over the right tuber ischii and knee joint. A consultation failed to discover the cause of this change for the worse. On March 2d, an opening formed at the upper portion of the cicatrix and discharged twelve ounces of ill-conditioned pus. The opening was enlarged and examined digitally and with a probe; the cavity was syringed out. March 9th, the patient's condition had improved since the opening of the sac. March 13th, about the same, discharge increasing in quantity. It was decided to make a counter opening at the lower extremity of the sac, on the inside of the thigh, and seven ounces of fetid pus escaped, which was soon succeeded by a jet of arterial blood. The sac was laid freely open and a compress of sheet-lead was held over the sac by an assistant provided with relays of assistants. About seven ounces of blood was lost during the operation. On March 14th, at 9 o'clock A. M., pressure was removed and bleeding occurred, five ounces being lost. Pressure was again applied. On March 15th, the patient was much brighter, and it was decided to keep up pressure until bleeding recurred, and then to enlarge the lower opening, search for the bleeding point, and, if it could not be found, to freely lay open the sac. At 7 o'clock P. M., seven ounces of blood were lost. Chloroform was given and the opening enlarged; clots were turned out, the entire cavity was exposed, and nothing more than a general oozing could be found. The cavity was thoroughly cleansed, and the slight oozing of blood was stopped by cold water. The patient sank soon afterwards, from the antecedent hæmorrhages and the shock of operation. An autopsy was made four hours after death: "Body much emaciated; rigor mortis well marked; right thigh flexed on pelvis and everted. The incision, made for the purpose of opening the suppurating cavity to arrest the hæmorrhage which occasioned death, was seven inches long, commencing about one and a half inches to the inner side and on a level with the anterior superior spinous process, and terminating on the inner side of the thigh. The thickness of the tissue divided, part of which was cicatricial, was about three and a quarter inches, in which ran the femoral vessels. These were found to have been divided by this incision but did not otherwise directly communicate with the aneurismal cavity. This cavity occupied the iliac fossa of the right side and was situated between the fibres of the iliac muscles, and had crowded the caput coli toward the median line. It extended from a level with the fourth lumbar vertebra to four and a half inches below Poupart's ligament. The sac or abscess in the thigh was about four inches in diameter and of a size nearly to contain a fœtal head. It had dissected up the tissues with the exception of the tendons, psoas, and iliacus from lesser trochanter, and anterior and inner surfaces of the femur. Below this point, at the bottom of the cavity, a track extended to the inside of the lesser trochanter and approached to within an inch of the surface of the tuberosity of the ischium. Another track extended in front of the pubes toward the root of the pubis. This extensive cavity contained about four ounces of coagulum mixed with blood, which gave to the smooth wall a sloughy appearance. At the inferior, beneath the femoral artery, a small quantity of fresh coagulum was found in the cellular tissue, suggesting the idea that the hæmorrhage had proceeded from this point, but the vessels causing it could not be found. An attempt had been made to inject the artery, but had failed for the want of proper instruments. On dissection of the abdominal walls the peritoneal cavity and its contents were found in a healthy condition. The external iliac artery of the right side, from its origin to the point of ligation, had diminished to a small cord about one-eighth of an inch in diameter, firm to the touch, and of a dark color from its containing clot. The principal branch of the external iliac, the epigastric, and circumflex were found larger than the corresponding arteries of the left side. The sacral artery was also enlarged. The chain of lymphatic ganglia along the inside of the iliac artery was much enlarged and indurated, and the tissue in the region of Poupart's ligament had been much altered and firmly matted together by inflammatory action. The femoral artery, as it passed under the ligament, was nearly three-fourths of an inch nearer the pubis than usual. The femoral vein was in a normal condition. The artery below the point of ligature to the point of division, in the operation immediately preceding death, was about three and one-fourth inches in length. This portion was laid open, together with the upper portion of the femoral artery, in order to ascertain, if possible, the locality of the original injury. About one and a half inches below the origin of the epigastric and its inner margin there was a faint permanent discoloration, which also

presented a slight linear appearance; elsewhere the artery presented no peculiar appearance." The specimen is represented in the wood-cut (FIG. 14), drawn from the preparation 3986, Section I, A. M. M., and presented by Dr. Weir to the Museum.

In the other seven cases of ligation of the external iliac the femoral artery had previously been ligated. Successful results were finally attained in two instances:

CASES 87–93.—Private J. S. Degolia, Co. A, 76th Pennsylvania, aged 32 years, wounded at Drury's Bluff, May 16, 1864. Surgeon A. Heger, U. S. A., described the injury and its result as follows: "The patient was admitted to the Point Lookout Hospital May 19th, having been wounded by a musket ball entering the right hip at the external and posterior aspect, passing across, over the pubes, to the left thigh, and downward toward the knee, wounding the great vessels of the left side, and making its exit one inch above the knee, on the external surface. On May 24th, the femoral artery was ligated above the wound two inches below Poupart's ligament. The patient was much prostrated from the severity of the wound and loss of blood. Stimulants were used, and warm applications to the limb. Repeated hæmorrhage required the ligation of the external iliac on May 29th. The patient died, of gangrene, June 1, 1864. The first operation was performed by Surgeon A. Heger, U. S. A., and the second by Surgeon J. H. Thompson, U. S. V."—Private W. S. Marshall, Co. E, 11th Pennsylvania Reserves, aged 26, wounded at Gaines' Hill, June 27, 1862. Assistant Surgeon C. Wagner, U. S. A., reported that the patient was admitted into Hammond Hospital with a "gunshot wound of the right thigh and false aneurism of the femoral artery. The aneurism measured six and a quarter inches in its longest diameter. Dr. Wagner ligated the femoral near Poupart's ligament. On September 6th, hæmorrhage to the extent of forty ounces occurred from the femoral artery. Dr. Wagner then tied the external iliac. The bleeding did not recur. The patient died September 16, 1862, from exhaustion."—Private H. Locke, Co. H, 6th Vermont, aged 23 years, wounded at the Wilderness, May 5, 1864. Surgeon Henry Janes, U. S. V., reported, from Sloan Hospital, Montpelier: "Gunshot wound, right thigh; ligation of femoral and iliac arteries for secondary hæmorrhage. Transferred to Veteran Reserve Corps December 5, 1864."—Sergeant-Major L. C. Sears, 5th New Hampshire, aged 22 years, wounded at Fredericksburg, December 13, 1862. Surgeon T. Antisell, U. S. V., reported from Harewood Hospital, Washington: "A conical ball entered the right thigh two inches below Poupart's ligament. On the morning of December 19th there was a slight hæmorrhage from the wound. Search was made for the ball without result. A counter opening was made and a seton inserted. He remained very comfortable until the 22d instant, when a severe hæmorrhage occurred, which necessitated the tying of the femoral in the ward, by Dr. Antisell. On Sunday, January 4, 1863, there occurred a hæmorrhage which was arrested by means of styptics and compression. Another hæmorrhage followed on the evening of January 7th, which could not be controlled by styptics. Search was made for the bleeding vessel without result. The patient lost much blood. On the following morning, January 8th, the patient was again brought into the operating room and the wound was carefully explored, but the bleeding vessel was not found. The operation of tying the external iliac artery was then performed by Dr. Antisell, in the hope of arresting the hæmorrhage permanently. The operation was no sooner completed than there was a welling up of blood from the point from which the previous hæmorrhage had proceeded. Styptics and compression were applied, and the patient was returned to the barrack. Stimulants and beef-tea were freely given, and warmth was applied to the extremities to restore reaction. He revived toward evening, and remained sensible and quite comfortable until the evening of the 10th instant. He died January 11, 1863, from exhaustion."—Lieutenant J. A. McQuillan, Co. I, 38th Ohio, aged 25 years, wounded near Atlanta, July 29, 1864. Surgeon J. H. Phillips, U. S. V., reported, from Hospital No. 1, Chattanooga: "Gunshot wound of right thigh. Hæmorrhage occurred on September 20th, thirty ounces of blood being lost. The femoral artery was ligated September 20th, in the wound, which was gangrenous. On the 26th, the hæmorrhage again returned, and it being found impossible to ligate it again in the wound, the external iliac was ligated just above Poupart's ligament, after which the hæmorrhage did not recur, but the gangrene continued, and the patient sank, and died October 2, 1864."—Private R. B. Cornwell, Co. A, 23d Ohio, aged 23 years, wounded at South Mountain, September 14, 1862. Assistant Surgeon W. E. Waters, U. S. A., reported from Caspari Hospital that the patient died November 3, 1862, of peritonitis. Acting Assistant Surgeon L. Heard reported:[1] "The shot had entered some four inches below Poupart's ligament, over the track of the femoral artery. An examination gave evidence that the femoral artery had been wounded and that a traumatic aneurism was forming. Water dressing was applied till the 29th, when compression by means of a horse-shoe tourniquet was made, and continued until October 4th. On October 10th, Drs. J. F. May and Shippen, assisted by Drs. Hall and Seeley, ligated the femoral artery. Ligatures were placed on the cardiac and distal sides, and the vessel was divided between the two ligatures. On the sixth or seventh day bleeding occurred, which was soon arrested and a tourniquet placed upon the limb. In about a fortnight after the operation the proximal ligature came away of itself, with knot and loop at the end. On October 30th, profuse secondary hæmorrhage took place, which greatly reduced the strength of the patient. Dr. May ligated the external iliac artery. The patient gradually sank, and died November 3, 1862."—Sergeant J. K. Zeiders, Co. I, 53d Pennsylvania, aged 19 years, wounded near Gettysburg, July 3, 1863. Acting Assistant Surgeon W. V. Keating reported, from Broad Street Hospital, Philadelphia: "Gunshot flesh wound of the right thigh by a conical ball. The wound sloughed, and secondary hæmorrhage occurred from the femoral artery on July 28th. The hæmorrhage recurring on August 4th, Acting Assistant Surgeon A. Hewson ligated the femoral artery just above Scarpa's triangle, and on August 11th again ligated the vessel higher up. The thigh became somewhat œdematous; by October 28th the wounds of the previous ligations had nearly healed externally. A sinus extended into the tissues below, which were found to be in a softened broken-down condition; ligature separated. On October 8th, Dr. Hewson administered ether and ligated the external iliac artery through a curved incision about three inches long; about six ounces of blood lost. October 25th, slight hæmorrhage from point of ligature, and another in the afternoon, amounting in all to about six ounces; controlled by styptics to wound and oil of turpentine and veratrum viride internally. Pulse 130 and weak." The patient was discharged from service May 14, 1864.

[1] HEARD (L.), *Wound of the Femoral Artery—Ligation of both Cardiac and Distal Sides of Severed Vessel—Secondary Hæmorrhage—Ligature of External Iliac—Peritonitis—Death;* in *Am. Med. Times*, 1862, Vol. V, p. 337; and *Boston Med. and Surg. Jour.*, 1862, Vol. LXVII, p. 369.

Professor John Ashhurst, jr., has lately remarked[1] that a study of the statistics of the operations of tying some of the larger arteries impresses the fact that "as cases have accumulated, the percentage of mortality has greatly increased."[2] This comment, however, is less applicable to the series of ligations of the external iliac artery.[3] In studying the statistics the operations for disease and for traumatic cause must be discriminated. The war cases have a fatality more than twice as great as those in civil practice.[4]

Ligation of the Femoral Artery.—In a previous portion of this section, commencing at page 16, reference is made to sixty-two ligations of the femoral artery for direct shot injury of the vessel, with the large mortality of 72.6 per cent. An interesting example of a well-managed successful case is adduced, and the great importance of ligating the distal as well as proximal extremities of the vessel is urgently enjoined. In addition to these sixty-two cases there were sixty-five instances in which the femoral artery was tied for consecutive bleeding unattended by primary injury to the vessel. The hundred and twenty-seven examples are enumerated in the summary entitled TABLE III. This series presents the same grave mortality as when the cases of direct lesion of the vessels were separately considered. References to publications of detailed cases are given; a few abstracts will be presented of cases which furnished pathological material for the Museum:

CASE 94.—Private B. Ayres, Co. A, 5th Iowa, aged 40 years, was wounded at Vicksburg, May 19, 1863, transferred by hospital steamer to Memphis, and admitted into Gayoso Hospital on the 27th. On the Medical Descriptive List appear the following notes by Acting Assistant Surgeon A. W. Nelson: "A minié ball entered the left thigh through the centre of Scarpa's triangle, passing to the inside of the vein and out at the lower part of the left nates. At the time of admission the wound was in a very dirty and sloughing condition and the skin had a dark tinge. There was considerable diarrhœa, with free perspiration; he was dozing a good deal of the time without any opiate; pulse 100. Water dressings were applied, and he was ordered to lie on the abdomen occasionally to allow the discharge to escape. Ale was given daily. He had a severe rigor on the evening of the 30th, and on the 31st, at 7 o'clock P. M., had hæmorrhage from the anterior wound, which was checked by a compress. Fifteen grains of quinine were divided into four powders, one powder to be given every four hours. At 2 o'clock P. M. on June 1st the wound was opened to the sheath of the femoral vessels and a darning needle removed from the sheath; there was no hæmorrhage, and all compression was removed. The wound was thoroughly cleansed, and the patient removed to bed. About 8 o'clock P. M. blood, in large quantities, burst forth in a jet, apparently from below; it was quite dark, but the exact shade was not observed. The femoral artery was immediately ligated, but with difficulty owing to the thickened and diseased condition of the parts. There was no hæmorrhage after ligation, but patient did not rally under the use of stimulants, and he died at 11 o'clock P. M. Chloric ether was used during the operation. The autopsy disclosed great sloughing in the course of the wound. There was a slough of the femoral vein of the size of a three-cent piece. The vein was pierced by the large needle alluded to above, two small holes existing opposite each other; the artery was healthy. It was observed that well marked symptoms of pyæmia existed several days before his death; however, the autopsy was not carried far enough to verify this diagnosis." The specimens (FIG. 15) consist of wet preparations of the left femoral artery ligated below the origin of the profunda, and of the femoral vein, showing the point of perforation by the needle, which were contributed by Dr. Nelson.

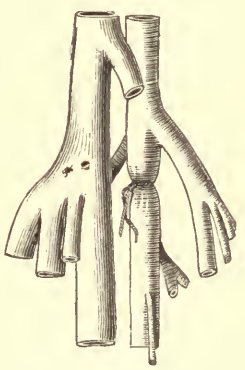

FIG. 15.—Femoral artery and vein. Ligation of artery. *Specs.* 2085, 2020.

[1] *Transactions of the International Medical Congress of Philadelphia*, 1877, p. 572.

[2] Thus Professor ASHHURST observes that when Dr. G. W. NORRIS published his classical paper in 1847 (*Am. Jour. Med. Sci.*, Vol. XIII, p. 24), he had collected sixteen cases of ligation of the common iliac artery with eight recoveries and eight deaths, a mortality of fifty per cent., while there are now recorded sixty-one cases with only thirteen recoveries and forty-eight deaths, a mortality of seventy-nine per cent.

[3] Thus HODGSON (*Treatise on Diseases of Arteries, etc.*, 1815, p. 416) enumerated twenty-one instances of ligations of the external iliac following the first operation by ABERNETHY, in 1796, and fifteen of the twenty-two patients completely recovered, or 68.2 per cent. In 1875, Dr. RABE collected (*Deutsche Zeitschrift für Chir.*, Leipzig, 1875, B. V, p. 213) two hundred and seven cases of ligations of the external iliac, of which one hundred and thirty-five recovered, or 65.2 per cent., advancing the death rate but 3 per cent., though the number of cases is decupled.

[4] Among American Surgeons two principal methods of ligating the external iliac artery are taught and practised. ABERNETHY, who first ligated this vessel on the living subject in 1796 (*The Medical and Physical Journal*, London, 1802, Vol. VII, p. 97, and *The Surgical and Physiological works of* JOHN ABERNETHY, London, 1830, Vol. I, p. 292), made a perpendicular incision "about three inches in length, through the integuments of the abdomen in the direction of the artery, and thus laid bare the aponeurosis of the external oblique muscle, which was next divided from Poupart's ligament, in the direction of the external wound, for the extent of nearly two inches. The margins of the internal oblique and transversalis being thus exposed, the finger was introduced beneath them for the protection of the peritonæum, and they were divided. Next, the peritonæum and its contents were pushed upward and inward, and the external iliac artery taken hold of with the finger and thumb. It now only remained to pass a ligature round the artery and tie it; but this required caution on account of the contiguity of the vein." In his second case, ABERNETHY made his incision in a line a little external to the artery to avoid the epigastric. Both of these operations failed, but ABERNETHY'S third and fourth attempts were completely successful. Sir ASTLEY COOPER'S operation is generally preferred as endangering the peritoneum less, and less weakening the abdominal parietes so as to give a tendency to hernia. Sir A. COOPER saved four of his six patients. His method of operating is described in HODGSON (*op. cit.*, p. 42), by HARRISON

CASE 95.—Private S. Brown, Co. G, 134th New York, aged 16 years, was accidentally wounded on August 30, 1862, and entered the Mansion House Hospital, Alexandria, six days afterwards. Assistant Surgeon W. A. Conover, U. S. V., contributed the following report of the injury: "The ball entered the left leg at the posterior middle third, penetrated the tibialis posticus muscle, and was extracted at the same opening. At first there was free discharge of laudable pus, but suppuration increased rapidly, and by September 26th infiltration of the tissues had nearly reached the popliteal space. Under a supporting treatment the patient seemed to gain rapidly until November 14th, when, during his sleep, a profuse hæmorrhage occurred from the sloughing of the posterior tibial artery and a great quantity of blood was lost before it was discovered. His condition not admitting an operation, the wound was plugged with styptics and a bandage was applied from the toes to the hip. This treatment controlled the hæmorrhage for eight days, stimulants being given freely in the mean time in order to prepare the system for an operation, if necessary. On November 28th another attack of bleeding was promptly controlled by the attendant, and, upon consultation, ligation of the femoral artery at the lower third was agreed upon as giving the patient a chance for his life. The operation was performed with some difficulty, owing to the abnormal structure of a branch artery which had to be carefully avoided. The patient bore the operation very well considering his condition, and, on the following day, his extremities were perfectly warm and remained so, showing that circulation had been re-established. The discharge, however, continued excessive, and although stimulants and tonics were used very freely, the patient sank steadily, and died of pyæmia on December 7, 1862. The autopsy confirmed the extensive disorganization from infiltration of pus, the artery being in an unhealthy condition up to within an inch of the ligature. The tying of the artery was a success, the clot having been perfectly formed and the circulation re-established by the profunda, which was sufficiently enlarged for the purpose." The ligated artery was contributed by Dr. Conover, a wet preparation of which is shown in the cut (FIG. 16).

FIG. 16.—Ligation of femoral. *Spec.* 1024.

FIG. 17.—Left femoral artery tied four and a half inches below the profunda. *Spec.* 3972.

CASE 96.—Private W. Colgan, Co. C, 2d Massachusetts Cavalry, aged 21 years, was wounded at Berryville, September 14, 1864. On the following day he was admitted to hospital at Sandy Hook, and three days afterwards he was transferred to Frederick. Assistant Surgeon R. F. Weir, U. S. A., reported: The wound was caused by a conoidal ball, which entered on the outer border of the popliteal space of the left limb, took a diagonal course up behind the femur, and emerged on the inner aspect at the lower portion of the upper third. The patient was very anæmic when admitted, and stated that he lost a considerable amount of blood on the field. Stimulants and generous diet were ordered. On September 24th there was an attack of hæmorrhage to the amount of twelve ounces, which was checked by compression. On the following day another hæmorrhage occurred, when the femoral artery was ligated four and a half inches below the profunda by Acting Assistant Surgeon J. C. Shimer. On the morning of September 28th there was slight oozing of arterial blood, when the openings were enlarged and the source of bleeding searched for ineffectually. Recourse was had to digital compression. Death ensued at 10 o'clock, September 28, 1864. At the *post-mortem* (see the adjoining wood-cut, FIG. 17) the femoral and profunda arteries were found to be intact. (See the *Catalogue* of the Surgical Section of the Army Medical Museum, 1866, p. 433.)

CASE 97.—Private I. Curler, Co. G, 5th Michigan, was wounded at Fair Oaks, May 31, 1862, and admitted to Hygeia Hospital, Fort Monroe, four days afterwards. Surgeon R. B. Bontecou, U. S. V., reported: "Gunshot wound of femoral artery, the ball entering the anterior and middle portion of the right thigh and passing out opposite posteriorly, going close to the inside of the femur. The temperature of the limb was good, although the artery at the ankle beat feebly. Hæmorrhage from both wounds occurred on June 10th, and returned in a few hours. An unsuccessful attempt to find the artery below the wound was made, and I tied the femoral, as I supposed, above the profunda; but pulsation being so strong in the artery exposed below the ligature, further search was made and the profunda was found unusually high up. This was also tied, and no hæmorrhage returned. The foot, before the operation warm, now became cold; but by the aid of external heat its temperature returned on the following day. The patient was a fine healthy looking young fellow. He was transferred to New York by steamer on June 12th." Surgeon S. W. Gross, U. S. V., contributed the specimen shown in the annexed cut (FIG. 18) and reported the result of the case as follows: "The patient was admitted to DeCamp Hospital, David's Island, New York, June 15th, and was placed under the charge of Acting Assistant Surgeon W. K. Cleveland. At the time of his admission the ligature had come away but the wound had not united. On June 17th, profuse hæmorrhage occurred from the profunda femoris, around which a ligature was cast. The patient, however, had lost so much blood that he succumbed two hours after the operation." The specimen (FIG. 18) consists of a small section of the femoral and profunda arteries, and shows the femoral blocked up with a clot at the seat of the ligature, also the ligature around the profunda, where another clot was formed.

FIG. 18.—Section of right femoral and profunda. Ligature on the former has cut its way out. *Spec.* 1004.

CASE 98.—Private D. Rapp, Co. K, 7th Indiana, aged 20 years, was wounded at Robinson's Creek, November 30, 1863. He was admitted to the field hospital of the 1st division, First Corps, where Surgeon G. W. Metcalf, 76th New York, noted: "Gunshot wound of left thigh." On December 6th, the wounded man was transferred to Douglas Hospital, Washington. Three days afterwards he was operated on by Assistant Surgeon W. Thomson, U. S. A., who furnished the following detailed

(*Surg. Anat. of the Arteries*, 4th ed., 1839, p. 351), and most of the text-books. Dr. STEPHEN SMITH has published a good account of thirty-two deligations of the primitive iliac artery (*Am. Jour Med. Sci.*, 1860, Vol. XL, p. 17). I have mentioned many of the more recent cases in a foot-note to Part II, Vol. II, p. 333, of the *Med. and Surg. Hist. of the War*. But by far the most comprehensive analytical summary furnished is given by Dr. L. RABE [*Zur Unterbindung der grossen Gefässstämme in der Continuität by Erkran-Kungen und Verletzungen der unteren Extremitäten*, in *Deutsche Zeitschrift für Chir.*, Leipzig, 1875, B. V, p. 213), who tabulates 207 cases of ligations of the external iliac, of which 72, or 34.7 per cent., proved fatal. Of these 207 cases the author distinguishes 34 with 22 deaths (64.7 %) as war cases, and 173 with 50 deaths (28.9) as cases from civil practice. In four of the cases from civil life the common iliac was afterwards ligated (twice successfully), and in one of the cases from war practice the same vessel was tied with temporary success. This was Dr. BRAINARD'S case, published in the *Chicago Med. Jour.*, 1864, Vol. XXI, p. 97, which Dr. RABE quotes from Professor GÜRLT'S *Jahresbericht* for 1864.

report of the case: He was a well developed and very muscular man and had been apparently in good health. At the moment of injury he was retreating, and was struck by a bullet on the posterior aspect of the left thigh a short distance below the gluteal fold, which passed through the limb to the inside of the bone, divided both femoral artery and vein, and made its exit three and a half inches below Poupart's ligament, at the point of election in ligating the femoral in Scarpa's space. There was profuse hæmorrhage at the time of injury, and an immediate want of sensibility in the leg and foot. When examined on the 7th of December, the whole limb was found warm and the collateral circulation had been established; but there was no pulsation in either of the tibial arteries. At the superior margin of the wound of exit there was a small tense swelling, which pulsated synchronously with the systole of the heart. An aneurismal thrill, resembling the loud purring of a cat, was distinctly felt, extending along the course of the vessels into the pelvis, but not communicating laterally. The little finger was introduced into the wound at the time of the operation, and the pulsation and thrill were found to be closely localized and confined to the divided ends of the femoral vessels. There was no extensive effusion of blood into the tissues of the thigh, and hence this was not in the strict surgical sense of the word a traumatic aneurism. It was concluded that the sac was composed only of the sheath, which had been united by inflammation after the division and retraction of its vessels, and had then been somewhat distended after the heart had regained its force. It was also suggested by Surgeon Lidell, who kindly saw the case with me, that there was a free communication between the divided artery and vein in this sac which permitted the arterial blood to return freely by the vein, as evinced by the pulsation communicating with such force backward toward the heart in the line of the vessels. It was unmistakable that there existed a wound of the femoral artery sufficient to cause its obliteration, that an aneurism was being developed at the divided proximal extremity, and that the proper surgical procedure would be to secure the ends of the vessel at the point of the injury. It was determined to emulate the example of Mr. Syme, to lay open boldly the sac by a free incision and search for and secure the bleeding orifices. It was hoped that the profunda had escaped injury, and every precaution was to be used to secure the femoral below its origin. A small hæmorrhage on December 9th rendered immediate interference necessary, and the following operation was then done with the assistance of Surgeon Lidell and the medical officers of the hospital. After the patient had been fully etherized and the femoral artery thoroughly compressed on the pubes by the thumb of a reliable assistant, as evinced by the loss of pulsation in the tumor, an incision four inches in length was made through the skin and fasciæ, immediately over the tumor and including the gunshot wound, in a line parallel with the sartorius. A second incision was now made into the tumor, which was dilated instantly by the finger to the size of the first. Distal hæmorrhage was anticipated, and it caused but little surprise when a most profuse dark colored torrent poured out from the incision. The lower angle of the incision was rapidly searched in vain for the source of the hæmorrhage, and it was feared that it might come from the dark softened depth of the track of the ball. No pressure on the artery had the least controlling effect upon it. The removal of the sponge was followed instantly by a boiling dark torrent of venous blood, which so quickly filled the cavity as to prevent any examination. So profuse and uncontrollable was the flow that visions of ligating the external iliac were vividly presented to the mind. When the flow was found to arise from the superior angle of the incision numerous and ineffectual efforts were made to secure the vessel, but the parts were so hardened by local inflammation that the forceps glided over them as it would over a cartilaginous surface. This point, from whence the dark blood seemed to flow, was finally compressed by the point of the left index finger, and by means of the nail of the small finger of the right hand a vessel was isolated, a ligature passed around it with an aneurism needle, and this hæmorrhage, most embarrassing because uncontrolled by pressure, was finally suppressed. The first ligature was applied at the superior angle of the incision to the proximal extremity of the divided femoral vein, from which this unexpected and most annoying hæmorrhage escaped by regurgitation from the saphena. The blood found its way into the limb by means of arteries arising from the iliac above the point compressed, was finding its way back by the saphena, enlarged to compensate for the occlusion of the femoral, was poured into the femoral a short distance above its divided proximal extremity, and then regurgitated through the stump of the femoral into the superior angle of the incision. The proximal end of the femoral artery, from which a crimson tide escaped on relieving the pressure slightly, was now easily found, and this was ligated. The wound was now thoroughly cleansed of all clots of blood. The femoral artery and vein, denuded of their sheath for a distance of two inches, were clearly seen at the bottom of the wound, their divided extremities having become adherent to the neighboring tissues during the inflammatory action of the previous ten days. As a precautionary measure a ligature was cast around the femoral artery at the lower angle of the wound, and some little difficulty was experienced in discriminating between the artery and vein, owing to the fact that from ten days' disuse the vein in becoming an impervious cord had become similar in size, color, and consistency to the artery. A small orifice was observed in the vein near its distal extremity, and from this occurred a free black flow on moving the limb. This was also included in a ligature. The wound was now closed by one or two sutures and the patient placed in his bed. A brief recapitulation may give clearness to the above account. The first vessel tied was, therefore, the proximal extremity of the femoral vein near the entrance of the saphena; the second, the femoral artery a short distance below the origin of the profunda, both at the superior angle of the incision; the third, the femoral artery at the lower angle of the incision and two inches from its distal extremity; the fourth, the femoral vein near its distal extremity at the centre of the incision, and to control a flow from an incision through its coats, which may have been made accidentally. The profunda had not been seen, and it was hoped that it would suffice to keep up the circulation. No important arterial channels had been interfered with by the operation, and a successful issue might be expected. The man was stimulated, took morphia, and his leg was covered closely in bed with blankets to preserve the animal warmth. This man had lost blood freely at the time of the injury; he had been subjected to a very long and fatiguing transport in ambulances and cars before reaching the hospital, and for seven days his food had not been as good or sufficient as might have been desired for one about to undergo such an operation. He was pallid and haggard looking, and iron, nutrients, and stimulants were freely ordered. There was great pain and restlessness during the ensuing night, and large quantities of morphia were required to procure sleep. December 10th, no interference with the circulation; leg and foot both warm. The whole limb is swollen, and bloody serum escapes freely at the point of

FIG. 19.—Ligation of femoral artery and vein. *Specs.* 2249, 2250.

the injury. December 12th, the restlessness has been the most marked symptom, caused seemingly by constant and severe but indescribable pain in the limb. The pulse is 120, the countenance pale and haggard, the tongue dry and coated, and the general symptoms indicate great nervous prostration. Large quantities of morphia have been found requisite. The whole limb and foot are much swollen and œdematous. On the evening unmistakable signs of sphacelus appeared, the foot became cold, and a hue of purple discoloration was observed as high up as the ankle. The neuralgic pain and restlessness still continued. On December 13th, all the symptoms were worse. The discoloration, the dark purple hue of gangrene, extended rapidly upward, particularly on the inside of the limb. The whole thigh became crepitant, the pulse more rapid and feeble. He became more and more depressed, and finally died at 12 o'clock at night. These final scenes all surgeons can imagine. The *post-mortem* revealed nothing interesting in the great cavities. The whole thigh and leg were found gangrenous as far as the point of the injury. The vessels were dissected, spread upon a board, and a most faithful picture was made of them by the artist under Dr. Brinton's direction. Only the proximal extremities of the vessels were found in the softened gangrenous mass; but they threw light upon the history of the case. The artery was divided below the origin of the profunda, which was uninjured, but not enlarged, as one would expect if the whole force of the circulation had been directed toward it by the obliteration of the main artery. In ten days the profunda should here have been as large as the femoral, if all the blood brought to the divided femoral had been seeking a passage through its calibre. Its undilated condition gives color to the idea that most of the blood brought to the divided femoral extremity found its way quickly back by the divided femoral vein; that the pressure was thus relieved, and that the profunda received only its usual supply of blood. That the limb was nourished by a collateral circulation, arising above the brim of the pelvis, is clear from the fact that no pressure on the external iliac would restrain the flow of blood from the saphena through the femoral vein. The saphena vein is normal, and its relation with the femoral indicates how easily the regurgitating hæmorrhage was caused, as no valves are there to prevent it. For several days—from the 9th to the 12th—there were no signs of an interference with the circulation, but at that time gangrene appeared and spread with great rapidity. This may have been due to the recent phlebitis of the profunda vein, which is now filled with a pink firm coagulum. The irritation caused by the operation, or due to the passage of the ball, may have induced the inflammation of this vein, now so vital to the support of the circulation. This seems to have been a wound of an artery, resulting in an aneurism the sac of which was composed of the re-united sheaths and enlarged probably by some dissection upward, in which a free passage of blood took place from the artery to the vein. No question as to the propriety of the operation now exists in my mind, since, as the sequel shows, no digital compression over the femoral would have sufficed to prevent or control a secondary hæmorrhage." The two specimens were contributed by the operator, Dr. William Thomson (see FIG. 19). The case is cited by Dr. Lidell.[1]

FIG. 20.—Unsuccessful proximal ligation of the right femoral artery for traumatic aneurism. *Spec.*509.

CASE 99.—Lieutenant R. W. Smith, Co. I, 5th Pennsylvania Reserve Corps, was wounded at the battle of Bull Run, Virginia, August 30, 1862, in the right thigh. He was conveyed to Alexandria in a rough wagon, and thence brought to Washington, and admitted to Douglas Hospital, September 5, 1862, with a circumscribed false aneurism of the femoral artery. The vessel was ligated in the continuity on September 7th. Secondary hæmorrhage followed, and the patient died September 8, 1862. At the autopsy it was ascertained that the hæmorrhage had been temporarily restrained by the direction of the wound and coagula in the large aneurismal sac. Recurrent hæmorrhage had led to the fatal result. The preparation is well represented in the accompanying wood-cut (FIG. 20) reduced to one-half.

CASE 100.—Private J. Hübner, Co. K, 5th Michigan, aged 29 years, was wounded at Fair Oaks, May 31, 1862, and conveyed to New York City one week afterwards. Dr. F. T. Foster, of the New York (Civil) Hospital, reported the following history: "He was admitted on June 8th, having been wounded by a musket ball, which entered the posterior fleshy part of the right thigh and had not been removed. The case presented nothing peculiar, and under simple treatment progressed well until June 27th, when there occurred from the wound a copious arterial hæmorrhage, controlled with difficulty by the application of lint and pressure. On the same day he was etherized and the wound opened; but the source of the hæmorrhage was not discovered. The wound was again stuffed with lint and the limb bandaged, after which Dr. T. M. Markoe tied the femoral artery a short distance below the origin of the profunda. The ligature came away on the 8th of July, and the incision and the original wound soon began to close by granulation. On the 29th the ball could be felt encysted beneath the integument on the anterior aspect of the thigh, but he declined to have it removed. On September 3d he was discharged from the hospital with the wound entirely healed and the limb in good condition." The man was discharged from service, at Fort Hamilton, New York Harbor, October 1, 1862, and pensioned. Examiner H. F. Montgomery, of Rochester, New York, certified, February 2, 1863: "A ball entered the right thigh in middle third, over the femoral artery, and was not abstracted. There is a long cicatrix in this region, and another behind, on the inside of the bone. His foot is benumbed, and, on exercise, swells and is painful. He is apparently in good health. He has a buckshot in the right leg below the knee." Examiner J. J. Lutze, of East Saginaw, Michigan, reported, March 4, 1874: * * "Large tender cicatrices on outer and inner posterior thigh, points of entrance and incision. Adductor brevis and longus muscles impaired and injured." This pensioner's rate of compensation was reduced from five-eighths to one-fourth on March 4, 1873, since which date he has not drawn any pension.

Besides the cases of ligation of the femoral artery above detailed, numerous other cases have been narrated at length in journals or elsewhere, to which references are given further on. In TABLE III, the entire series of thirty-six recoveries and ninety-one fatal cases are noted alphabetically, and the principal facts regarding them are concisely recorded.

[1] LIDELL (J. A.). *On the Wounds of Blood-Vessels, Traumatic Hæmorrhage, Traumatic Aneurism, and Traumatic Gangrene, in Surgical Memoirs of the War of the Rebellion, collected and published by the United States Sanitary Commission*, 1870, Vol. I (Surgical), p. 143.

TABLE III.

Summary of One hundred and Twenty-seven Cases of Ligation of the Femoral Artery for Hæmorrhage from Shot Injuries unattended by Fractures.

No.	Name, Military Description, and Age.	Dates.	Injury, Operator, and Result.
1	Ambrose, T. L., Chaplain, 12th New Hampshire, age 35.	July 25, Aug. 15, 1864.	Right thigh; hæm.; femoral lig.; hæm. from branch of profunda—large branch tied. Died Aug. 20, 1864.
2	Archibald, T., Pt., G, 24th Mass., age 18.	April 2, 12, '65.	Right femoral artery wounded and ligated; one end tied. Died April 26, 1865, pyæmia.
3	Atwood, L. D., Pt., B, 32d Mass., age 31.	Sept. 30, Oct. 31, 1864.	Left thigh, middle third; ligation of femoral, both ends tied. Died November 9, 1864.
4	[1]Ayres, B., Pt., A, 5th Iowa, age 40.	May 22, June 1, 1863.	Left thigh; hæm.; wound opened and a darning needle removed from sheath of vein; artery ligated. Died June 1, '63, pyæmia. *Specs.* 2020, 2085, A. M. M.
5	Bailey, J., Pt., I, 55th Penn., age 26.	June 18, Jul. 9, '64.	Left thigh; ligation of femoral. Died July 10, 1864.
6	Banfill, T., Serg't, C, 19th Indiana, age 20.	May 12, June 12, 1864.	Left thigh; femoral ligated, by Surg. T. R. Crosby, U. S. V. Died June 12, 1864, pyæmia.
7	Barkeloo, J., Pt., M, 2d Ohio Cav., age 28.	July 19, 1863.	Right popliteal artery severed; primary lig. of femoral artery; amp. thigh. Disch'd Mar. 17, '65.
8	*Bedingfield, J. T.*, Capt., G, 60th Georgia, age 25.	Mar. 25, April 15, 1865.	Both thighs; left femoral ligated, by A. A. Surg. N. A. Robbins. Died April 25, 1865, exhaustion.
9	Bell, J. C., Pt., E, 34th Iowa, age 23.	April 6, 17, '65.	Left leg, cutting post. tib. artery; fem. lig., by Surg. A. McMahon, U. S. V.; amp. thigh for recurrent hæm. Died Ap. 23, '65, exhaus'n.
10	Bills, C., Pt., K, 17th New York, age 20.	Aug. 30, Sept. 26, 1862.	Wound of thigh, involv. profunda artery; both ends femoral tied; sloughing. Died Oct. 4, 1862.
11	Blake, G., Pt., I, 3d West Virginia.	Aug. 26, Sept. 9, 1863.	Shot wound of left femoral artery; vessel tied, by Surgeon W. D. Stewart, U. S. V. Furloughed Nov. 12, 1863. Wounds healed.
12	Brown, S., Pt., G, 134th New York, age 16.	Aug. 30, Nov. 28, 1862.	Left leg; fem. lig. in lower third, by Asst. Surg. W. A. Connor, U. S. V. Died Dec. 7, 1862, pyæmia. *Spec.* 1024, A. M. M.
13	*Brown, W.*, Serg't, 1st Maryland Artillery.	Dec. 10, —, '63.	Left thigh; femoral ligated. Recovered.
14	[2]*Check, M.*, Pt., I, 61st North Carolina.	July 30, Aug. 3, 1864.	Femoral artery severed; femoral artery ligated, by Surg. D. F. Wright, P. A. C. S. Recovered.
15	*Clark, W. L.*, Pt., H, 25th North Carolina, age 20.	April 1, 10, '65.	Shot wound lower third right femoral artery; artery tied, by A. A. Surg. J. Morris. Died April 19, 1865, gangrene.
16	Claypole, S., Pt., D, 62d Penn., age 27.	May 30, June 8, 1864.	Right leg; femoral lig., by Asst. Surg. W. F. Norris, U.S.A. Died Aug. 4, '64, asthenia and pleuro-pneumonia.
17	Clelland, W., Pt., A, 8th New York Heavy Art., age 18.	June 1, July 24, 1863.	Left thigh; one end of femoral tied. Died July 24, '64, typhoid fever.
18	Clover, B., Civilian, age 16.	Aug. 23, Sept. 1, 1864.	Left fem. artery injured; aneurism; femoral tied. Recovered.
19	Clymer, J., Pt., B, 104th Pennsylvania.	May 31, June 16, 1862.	Left popliteal space; femoral lig., by A. A. Surg. M. K. Cleveland. Died June 16, 1862.
20	[3]*Coble, J. A.*, Pt., F, 45th North Carolina, age 20.	Nov. 27, '63, Jan. 23, '64.	Left thigh; diffused trau. fem'l aneurism; fem. lig. above and below; femoral vein also tied. Recovered.
21	Colgan, W., Pt., C, 2d Mass. Cavalry, age 21.	Sept. 14, 25, '64.	Left thigh; fem. lig. in continuity, by A. A. Surg. J. C. Shrimer. Died Sept. 28, '64, loss of blood and exhaust. *Spec.* 3972, A.M.M.
22	Connell, M., Pt., K, 2d New York Heavy Art., age 34.	April 7, June 15, 1865.	Right thigh; one end of fem. tied, by A. Surg. O. P. Sweet, U.S.V. Died June 16, 1865, exhaustion.
23	Coultes, W. H., Lieut., C, 61st New York.	June 1, 18, '62.	Middle of thigh; both ends femoral tied, by A. A. Surg. W. Hunt. Died June 23, 1862, shock.
24	Coy, J. H., Serg't, K, 6th Maine, age 28.	Nov. 7, 24, '63.	Left thigh; femoral lig., by A. A. Surg. J. C. W. Kennon; hæm. recurred; religated, by A. A. Surg. T. O. Bannister, Dec. 1; again on Dec. 23, by Surg. D. W. Bliss, U. S. V. Died Dec. 23, 1863.
25	*Crowder, D. J.*, Pt., Stamford's Bat'ry, age 23.	Dec. 16, '64, Jan. 9, '65.	Right thigh; ligation of femoral, by A. A. Surg. D. D. Talbot. Died Feb. 3, 1865, gangrene.
26	Cummings, J. M., Pt., D, 49th Indiana.	Dec. 28, 1862.	Shot wound right femoral artery; vessel ligated. Died Jan. 29, '63.
27	Cummins, H., Pt., A, 7th West Virginia, age 21.	May 8, 25, '64.	Right thigh; femoral tied above profunda. Died May 29, 1864.
28	Curler, L., P., G, 6th Michigan.	May 31, June 10, 17, '62.	Right thigh; fem. and profunda lig.; hæm. recurred; profunda relig. Died June 17, 1862. *Spec.* 1004, A. M. M
29	Darling, S. G., Pt., D, 32d Maine, age 19.	May 12, 1864, On field.	Fem. artery severed; vessel lig.; May 26th, thigh amp., by Surg. R. B. Bontecou, U. S. V. Died May 26, 1864, hæmorrhage.
30	Delamater, M., Corp'l, G, 7th Michigan Cavalry, age 20.	May 28, July 10, 1864.	Right thigh; lig. of femoral, by A. Surg. H. M. Sprague, U.S.A. July 12th, thigh amputated. Died Aug. 7, 1864, pyæmia.
31	Dier, W., Corp'l, A, 129th Pennsylvania, age 23.	Dec. 13, '62, Feb. 22, '63.	Left popliteal space; femoral lig. Died Mar. 4, 1863, pyæmia.
32	Doyle, L., Pt., K, 8th Maine, age 34.	May 20, June 1, 1864.	Right thigh; femoral and several branches ligated above and below wound, by Surg. A. Heger, U. S. A. June 6th, thigh amp. Died June 6, 1864, exhaustion.
33	*Dunn, G. R.*, Serg't, E, 25th S. Carolina, age 20.	May 16, 29, '64.	Right thigh; femoral ligated. Recovery.
34	Edwards, J. W., Pt., B, 28th Illinois, age 18.	Mar. 26, April 20, 1865.	Right leg; femoral ligated, by A. A. Surg. H. B. Cole. Recovery.
35	Edwards, R., Pt., G, 98th Illinois.	June 25, Jul. 6, '63.	Both thighs; femoral ligated. Died July 11, 1863.
36	Elliott, E., Pt., H, 118th Pennsylvania, age 21.	June 3, 13, '64.	Right thigh; femoral ligated, by Asst. Surg. H. Allen, U. S. A. Died June 21, 1864, gangrene.
37	Freeman, C. A., Serg't, B, 37th Mass., age 22.	April 6, 15, '65.	Left thigh; femoral art'y ligated, by Surg. B. A. Vanderkieft, U. S. V. Died April 18, '65, anæmia.
38	*Gardner, R. T.*, Pt., A, 1st Md. Battal'n, age 19.	July 2, 23, '63.	Both thighs; left femoral ligated. Doing well November 30, 1863.
39	Gilley, M., Pt., I, 9th N. York State Militia, age 37.	May 5, —, '64.	Right thigh, involving femoral artery; femoral ligated. Died May 27, 1864, of pyæmia.
40	Goodwin, A., Pt., B, 2d New Hampshire.	July 2, 20, '63.	Left thigh; femoral ligated above and below. Died Aug. 8, 1863.
41	Graham, J. A., Serg't, H, 116th Penn., age 21.	June 1, 10, '64.	Right thigh; hæm.; profunda lig.; hæm. recurred; fem. lig. Died June 13, 1864.
42	Gray, J., Pt., D, 2d Pennsylvania Heavy Art'y, age 17.	June 18, 30, '64.	Left thigh; femoral tied in continuity, by Surg. N. R. Mosely, U. S. V. Died July 12, 1864.
43	[4]Gross, C., Pt., K, 6th Pennsylvania Cavalry, age 26.	May 30, 31, '64.	Left femoral artery divided; ligatures placed above and below. Died June 8, 1864, exhaustion.
44	[5]Hagan, J., P., G, 76th Pennsylvania.	July 17, 23, '64.	Right thigh; fem. tied at proximal extrem. and accompanying vein at prox. and distal ends; gang. Died July 27, 1864.
45	Hamilton, E., Capt., G, 15th New Jersey, age 19.	May 6, 15, '64.	Right femoral vein and branch of profunda divided; femoral tied, by Surg. H. W. Ducachet, U.S.V. Died May 16, 1864; exhaustion.
46	Harbaugh, H., Serg't, K, 7th Wisconsin, age 22.	July 2, Sept. 13, 1863.	Left thigh; femoral ligated. Discharged July 21, 1864, atrophy of thigh and leg.
47	Harrington, W. J., Pt., C, 16th Wisconsin.	July 5, 16, '64.	Left thigh; both ends of femoral tied, by Surg. G. F. French, U. S. V. Died July 20, 1864.
48	Harris, J. M., Corp'l, C, 14th Iowa, age 20.	July 15, 27, '64.	Right fem. art. injured; aneurism; art. ligated above and below sac, by Surg. J. G. Keenon, U. S. V.; amp. leg, by A. A. Surg. R. W. Coale. Died Aug. 3, '64, pyæmia.
49	Harrison, E., Serg't, P, 10th New York.	May —, 1864.	Right thigh; ligation of femoral, by Surg. M. Rizer, 72d Penn. Died May 22, 1864.
50	Hickey, T., Pt., G, 73d Pennsylvania, age 53.	Aug. 30, Se. 27, '62.	Right thigh; common femoral tied in continuity. Died Sept. 27, '62.
51	*Horn, S.*, Pt., H, 53d North Carolina, age 21.	Mar. 25, July 9, 1865.	Left thigh; femoral ligated, by A. A. Surg. J. Morris. Died July 14, 1865, hæmorrhage.

No.	Name, Military Description, and Age.	Dates.	Injury, Operator, and Result.
52	Houser, P., Serg't, H, 76th Pennsylvania, age 26.	Aug. 16, Sept. 10, 1864.	Left thigh; femoral ligated in continuity, by A. A. Surg. J. H. Packard. Disch'd May 20, 1865, and pensioned. Lameness.
53	Hübner, J., Pt., K, 5th Michigan, age 29.	May 31, June 27, 1862.	Right thigh; femoral ligated. by Dr. T. M. Markoe. Discharged Oct. 1, 1862; pensioned.
54	Huggins, W., Serg't, G, 50th Illinois, age 25.	Mar. 16, April 3, 5, '65.	Right thigh; hæm.; profunda lig., by A. A. Surgeon H. Sanders; hæm. recur.; fem. tied, by A.A. Surg. E. DeWitt. Died April 8, 1865.
55	Hunt, J. L., Pt., G, 57th New York, age 41.	May 5, July 9, 1864.	Left thigh; femoral ligated; dry gangrene of toes; Sept. 5th, amp. toes. Disch'd June 6, 1865.
56	Hurlbut, G. Q., Pt., G, 109th N. York, age 37.	May 17, June 8, 1864.	Both thighs; hæm.; fem. lig. in continuity; hæm.; profunda lig.; hæm.; vessel religated. Died June 8, 1864.
57	Jones, W. H., Pt., C, 14th New York Heavy Artillery.	June 9, July 5, 1864.	Right thigh; fem. tied in wound, by Surg. H. Palmer, U. S. V. Died Sept. 25, 1864, chronic diarrhœa.
58	*Jones, W. W.*, Ensign, Thomas's Legion, age 25.	Sept. 19, Oct. 2, 1864.	—— thigh, involving fem. artery; ligation of femoral artery. Died Oct. 5, 1864, hæmorrhage.
59	Judd, I. E., Lieut., K, 49th Mass., age 25.	May 25, June 12, 1863.	Right thigh; fem. art. tied at both ends, by Med. Insp. P. Pineo, U. S. A.; fem. vein included in a ligature. Died June 13, 1863.
60	Karlmyer, F., Pt., K, 48th New York, age 37.	June 1, 9, '64.	Right thigh; femoral ligated, by Surgeon E. Bentley, U. S. V. Discharged May 20, 1865.
61	Kimber, W., Pt., D, 36th Illinois, age 33.	Nov. 29, '64, Jan. 20, '65.	Left thigh; both ends of femoral tied. Died January 26, 1865.
62	Landon, L., Lieut., H, 6th Colored Troops, age 20.	Sept. 29, Oct. 9, 1864.	Left thigh; also fract. left radius; both ends of fem. tied in wound. Died Oct. 28, '64, pyæmia.
63	Lang, W. M., Pt., C, 40th New York, age 34.	April 2, 13, '65.	Right leg; femoral ligated. Died April 16, 1865, mortification.
64	Lapp, C., Pt., I, 22d Wisconsin, age 21.	July 28, Aug. 11, 1861.	Left fem. art'y wounded; vessel lig., by A.A. Surg. J. M. Brown. Died Aug. 11, '64, hæmorrhage.
65	*Layne, J. H.*, Pt., B, 19th Virginia, age 18.	April 6, 25, '65.	Right thigh; fem. vein rupt.; fem. lig. at middle portion, and vein above and below rupt., by A.A. Surg. J. Morris; hæm. recurred May 6, fem. relig. abo. profunda. Died May 7, 1865.
66	*Lee, J. A.*, Pt., I, 17th Mississippi, age 25.	July 2, 21, '63.	Left leg; femoral artery ligated. Transferred to prison at Fort McHenry, Md., March 2, 1864.
67	Leline, G., Serg't, C, 8th Michigan, age 27.	Nov. 28, Dec. 5, 1864.	Right fem. art'y injured; ligature applied, by A. A. Surg. S. T. Williams. Died Dec. 5, 1864, shock and hæmorrhage.
68	[1]Lenneghan, P., Serg't, B, 88th New York, age 30.	April 6, 20, '65.	Right thigh; femoral ligated in continuity, by Surg. J. Aiken, 71st Penn. Disch'd July 26, '65; pensioned. Died Nov. —, 1875.
69	Lesler, J., Pt., K, 148th New York, age 28.	June 6, July 28, 1864.	Left leg; both ends femoral tied, by A. A. Surg. W. P. Moore. Disch'd January 11, 1865.
70	Lund, E. T., Pt., C, 4th New Hampshire, age 20.	June 30, Aug. 12, 1864.	Left thigh, and fract. right knee joint; left fem. tied above and below, by Asst. Surg. W. Thomson, U. S. A. Died Aug. 23, '64, pyæmia. *Spec.* 3592, A.M.M.
71	McNally, J., Pt., G, 69th New York, age 24.	June 16, July 4, 1864.	Right thigh; femoral tied in continuity, by A. A. Surg. O. P. Sweet. Furloug'd Nov. 1, '64.
72	McReynolds, J., Corp'l, 60th Ohio S. S., age 20.	Aug. 19, Sept. 5, 1864.	Both thighs; femoral tied, by A. A. Surg. H. B. Maben; hæm. recur. Sept. 11th; artery relig., by A. A. Surg. E. De Witt. Died Sept. 17, '64, hæmorrhage.
73	Mason, J. W., Pt., I, 12th New York, age 21.	Aug. 30, —, '62.	Right femoral artery; ligature applied. Died Sept. 28, 1862.
74	Miller, G. H., Pt., F, 3d Iowa, age 23.	May 18, June 3, 1863.	Both thighs, dividing right profunda artery; right fem. ligated. Died June 10, '63, hæmorrhage. *Spec.* 2086, A. M. M.
75	Mills, J., Pt., D, 4th Missouri Cavalry.	Jan. 16, Feb. 7, 1864.	Left fem. artery wounded; ligature applied. Died February 17, 1864.
76	*Moore, W.*, Pt., G, 5th North Carolina, age 27.	Oct. 19, 20, '64.	Right fem. artery wounded; lig. applied, by Surg. J. F. Pearson, 5th N. C. Exch'd Feb. 16, '65.
77	Moserip, W. S., Serg't, K, 19th Wis., age 35.	Aug. 22, 27, '64.	Left fem. artery injured; femoral ligated. Died Sept. 14, '64, hæm.
78	[2]O'Keefe, J., Major, 2d New York Cavalry, age 24.	Mar. 31, —, '65.	Right fem. art'y injured; femoral tied, and, hæm. recurring, vessel religated. Died May 31, 1865.
79	*Pack, J. R.*, Pt., D, 39th North Carolina, age 17.	April 8, 27, '65.	Right fem. artery wounded; ligated, by A. A. Surg. H. B. Cole. Died April 27, 1865, cong. chill.
80	Paden, W., Corp'l, G, 10th Pennsylvania Reserves, age 22.	May 23, June 1, 1864.	Great laceration right thigh; fem. tied in continuity, by Surg. G. L. Pancoast, U.S.V.; leg gang.; amp. leg by same operator. Died June 26, 1864, gangrene.
81	Palmer, J. C., Pt., G, 10th Conn., age 18.	April 2, 10, '65.	Right thigh; femoral tied at both ends. Disch'd July 5, '65; pen'd.
82	[3]*Paschal, J.*, Pt., I, 2d N. Carolina Cavalry.	Aug. 16, 27, '64.	Right thigh; femoral ligated, by Surg. D. F. Wright, P. A. C. S. Retired February 22, 1865.
83	Pennsyl, E., Pt., H, 93d Pennsylvania.	May 31, J'e 16, 62.	—— fem. artery wounded; vessel tied. Died July 5, '62, pyæmia.
84	Perry, T., Serg't, D, 16th Michigan, age 30.	Sept. 30, Nov. 19, 1864.	Right thigh; femoral tied at both ends, by A.A. Surg. G.B.R. Robinson. Died Nov. 21, '64, exh'n.
85	Peters, W. C., Pt., C, 68th Penn., age 19.	July 2, 15, '63.	Left thigh; artery secured. Died July 15, 1863, hæmorrhage.
86	Pickett, J., Pt., F, 8th Illinois Cavalry, age 21.	June 20, 20, '63.	Right fem. artery severed; artery secured. Disch'd June 9, '64.
87	Pope, P. P., Pt., M, 67th Ohio, age 22.	May 9, 21, '64.	Right thigh; fem. tied in continuity. Died May 22, '64, exh'n.
88	Pope, W., Pt., I, 2d N. York Artillery, age 19.	June 3, 20, '64.	Left thigh; one end of artery tied. Died June 24, '64, hæmorrhage.
89	[4]Rapp, D., Pt., K, 7th Indiana, age 20.	Nov. 30, 1863.	Left thigh; fem. art. and vein divided; double lig. placed upon fem. art. and vein. Died Dec. 13, 1863. *Specs.* 2249, 2250, A. M. M.
90	*Reed, J. P.*, Pt., 19th Alabama, age 20.	April 6, May 29, 1862.	Right thigh; fem. artery ligated, by Surg. J. T. Hodgen, U. S. V. Died June 20, 1862.
91	Ringer, O., Pt., C, 60th Ohio, age 21.	July 6, Aug. 24, 1864.	Right thigh; femoral ligated, by A. A. Surg. J. P. Holt. Died Aug. 25, 1864, hæmorrhage.
92	Roberts, A. F., Pt., I, 127th Illinois, age 20.	May 19, J'e 5, '63.	Left popliteal space; fem. artery tied. Died June 7, 1863.
93	Rodgers, S. J., Pt., A, 2d Michigan, age 21.	June 17, July 26, 1864.	Right thigh. July 22d, aneurism; fem. tied, two ligatures, by A.A. Surg. O. W. Peck. Died July 30, 1864, hæmorrhage.
94	*Ross, A. G.*, Corp'l, I, 12th Mississippi, age 21.	Oct. 19, —, '64.	R't and left thighs; fem. wounded and lig.; Nov. 8, amp. right leg above ank. Retired Mar. 14, '65.
95	Rowe, J. B., Pt., G, 12th N. Hampshire, age 22.	May 14, June 12, 1864.	Right thigh; gang.; fem. artery lig. in wound, both ends tied, by Surg. A. Heger, U. S. A., and A.A. Surg. T. Liebold. Disch'd June 5, 1865; pensioned.
96	[5]S——W——, —, I, 17th New York.	Sept. 1, 12, '64.	Right thigh; proximal end of fem. artery tied, by Surg. E. Batwell, 14th Michigan. Sent to rear ten weeks after injury.
97	Sager, W., Serg't, E, 188th N. York, age 19.	April 1, 22, '65.	Right thigh; both ends of femoral tied, by Asst. Surg. W. F. Norris, U.S.A. Died Ap'l 29, '65, pyæm.
98	Sassaman, L. H., Pt., E, 12th Penn. Reserves, age 24.	May 8, June 4, 1864.	Right leg, wounding ant. tibial artery; femoral tied, by A. A. Surg. J. S. Cohen. Disch'd July 21, 1865; pensioned.
99	*Self, J.*, Pt., H, 11th Alabama.	——, July 11, '62.	—— thigh; femoral ligated. Died July 11, 1862.
100	Sharpe, A., Pt., D, 11th Pennsylvania.	June 21, 21, '64.	Both thighs; both ends of —— femoral tied. Died June 26, '64.
101	Sheaffer, C., Pt., D, 1st New York Cavalry.	June 5, July 8, 1864.	Right fem. artery injured; vessel secured, by Surg. R. F. Baldwin, P. A. C. S. Died J'y 21, '64, gang.
102	Sheffer, G. W., Pt., C, 5th U. S. Art., age 22.	May 24, 24, '64.	Left fem. artery severed; ligated, by Surg. N. Hayward, 20th Mass. Disch'd Jan. 30, 1865.
103	Simmons, T., Pt., F, 97th New York, age 26.	June 18, July 27, 1864.	Left thigh; femoral ligated in continuity and wound. Died August 3, 1864, gangrene.
104	*Smith, H.*, Pt., F, 21st Virginia, age 41.	Oct. 19, Nov. 10, 1864.	Both thighs, scrotum, right fem. artery severed; vessel tied, by Surg. W. W. Wilkerson, C. S. A. Retired from service Mar. 14, '65.
105	Smith, J., Pt., D, 97th Pennsylvania, age 22.	May 18, June 2, 1864.	Both thighs; hæm. from circumflex; right femoral tied. Died June 5, 1864, hæmorrhage.
106	Smith, R. W., Lieut., G, 5th Penn. Reserves, age 24.	Aug. 30, Sept. 7, 1862.	Right thigh; fem. art'y wounded; lig. in contin'y. Died Sept. 7, '62, loss of blood. *Spec.* 509, A.M.M.

No.	Name, Military Description, and Age.	Dates.	Injury, Operator, and Result.
107	Smith, W. F., Major, 1st Delaware.	Oct. 27, 27, '64.	Right thigh; fem. lig. above and below, vein also tied; amp. thigh, Surg. A. N. Dougherty, U.S.V. Died Nov. 6, 1864.
108	Sockwell, C. L., Pt., K, 13th N. Jersey, age 22.	May 6, 6, '64.	Right thigh; femoral secured. Disch'd June 30, '65; pensioned.
109	[1]*Spivey, D.*, Pt., C, 5th N. Carolina, age 46.	——, July 8, '63.	Left thigh, also right leg; aneurismal tumor of left fem. art.; fem. tied, by Surg. E. B. Haywood, C. S. A. Recovered Jan. 10, '64.
110	Story, F., Pt., E, 38th Ohio, age 22.	July 23, Sep. 9, 64.	Right thigh; gangrene; both ends of fem. tied. Died Sept. 10, '64.
111	Sweeney, J. L., Serg't, D, 12th Mass., age 25.	May 15, 30, '64.	Right fem. artery injured and lig. Disch'd from hospital Oct. 15, 1864; pensioned.
112	Thorn, H. C., Pt., I, 14th West Virginia, age 19.	July 20, Aug. 7, 1864.	Right thigh; fem. ligated; hæm. recurred from profunda; thigh amp., by Surg. J. B. Lewis, U. S. V. Died Aug. 12, 1864.
113	Tompkins.—, substitute, age 21.	July 28, 29, '63.	Right leg and left arm; femoral ligated; gang. Aug. 3d, trismus. Died Aug. 4, 1863, tetanus.
114	*Unknown*.....	Sept. 17, 22, '62.	Wound of fem. art.; proximal end tied in wound. Died Sept. 22, '62.
115	Yearing, W., Pt., G, 12th Missouri, age 30.	May 22, June 22, 1863.	Right thigh; small aneurism of femoral artery; femoral tied. Returned to duty Dec. 16, 1863.
116	[2]Vickery, R. S., Asst. Surgeon, 2d Michigan.	July 30, 30, '64.	Left thigh; femoral tied, by Surg. W. B. Fox, 8th Mich. Disch'd Mar. 14, '65; pens'd. Appointed Asst. Surg. U.S.A., May 14, 67.
117	*Wakeham, J. E.*, Corp'l, E, 18th Virginia, age 27.	Mar. 31, April 10, 1865.	Left fem. artery involved; lig. of artery above profunda, by A. A. Surg. J. Morris. Hæm. recur'd; relig. just below Poupart's lig. Died April 28, '65, exhaustion.
118	Wilder, E., Corp'l, A, 100th N. York, age 19.	Aug. 16, Sept. 21, 1864.	Left leg; hæm. from post. tibial artery; fem. tied in continuity, by A. A. Surg. J. C. Morton. Deserted March 23, 1865.
119	Williams, C., Pt., F, 5th Colored Troops, age 23.	Sept. 29, Oct. 15, 1864.	Laceration left thigh; both ends of fem. tied in wound, by A. A. Surg. O. Warner; hæmorrhage recurred. Died October 21, 1864, phlebitis.
120	Williams, G., Pt., E, 9th N. York, Heavy Art., age 31.	July 9, Aug. 3, 1864.	Left thigh; art'y tied below origin of profunda, by A. A. Surg. J. C. Shimer. Died August 4, 1864, exhaustion.
121	Willis, jr., A., Pt., I, 7th Rhode Island, age 25.	Dec. 13, 25, '62.	Right femoral artery injured and ligated. Died Dec. 28, 1862, from previous bleeding.
122	[3]Wilson, J., Pt., 27th N. York Battery, age 26.	May 26, July 16, 1863.	Left thigh; ball passed close to femoral vessels; large aneurism of fem. artery; fem. tied above and below, by A. A. Surg. G. B. Hammond. Duty July 31, 1863.
123	Winchell, C. D., Pt., K, 38th Wisconsin, age 19.	April 2, 12, '65.	Left thigh; fem. lig. in continuity, by Surg. J. C. McKee, U. S. A. Disch'd July 3, 1865; pensioned.
124	Winchester, D. W., Pt., I, 1st Mass. H'vy Ar'y, age 21.	May 19, 28, '64.	Left thigh; sloughing; femoral tied in continuity, by Surg. T. R. Crosby, U. S. V. Duty Febru ary 10, 1865.
125	Witham, A., Pt., A, 1st Maine Heavy Art'y, age 20.	May 19, June 29, 1864.	Left thigh; fem. ligated, by A. A. Surg. J. Newcombe. Died July 2, 1864, loss of blood.
126	Wood, W. R., Pt., H, 81st Indiana.	Dec. 31, '62, Jan. 17, '63.	Right thigh; femoral tied. Duty June 22, 1863; pensioned.
127	Worley, S., Pt., A, 139th Pennsylvania, age 20.	May 5, 20, '64.	Right thigh; fem. ligated. Died June 2, 1864.

Of this series of one hundred and twenty-seven cases with ninety-one deaths, the mortality rate of 71.7 per cent. of the aggregate scarcely varies from that of the smaller series of ligations for direct shot injury of the femoral adverted to on page 16.

Ligations of the Profunda Artery.—Six instances were reported of ligation of the profunda in addition to the cases in which that vessel was tied in connection with ligations of the femoral. Brief abstracts of the two successful and four fatal cases are subjoined:

Cases 101–106.—Sergeant *R. W. Bedingfield*, Co. G, 60th Georgia, age 18 years, wounded at Monocacy, July 9, 1864; admitted into hospital at Frederick; conoidal ball passed through upper third of left thigh and lodged near the inner side of right femur, wounding the right profunda artery; traumatic aneurism, sac five inches in length, containing at least a pint of clotted blood. August 15th, Acting Assistant Surgeon J. H. Bartholf laid open the aneurismal sac. Bleeding came from the profunda artery; a ligature was applied above and below the wound of the artery by an incision four inches along the sartorius muscle; the patient was in good condition though irritable and depressed; brandy was given every hour during the day after the operation; hæmorrhage did not recur. August 25th, ligature came away; the wound healed, and the patient was transferred to Point Lookout, October 25th, for exchange.—Private J. H. Beun, Co. E, 45th Pennsylvania, aged 18 years, wounded at the Wilderness, May 6, 1864. Admitted into Campbell Hospital, Washington; shot wound of thigh. May 28th, bleeding to amount of forty-eight ounces from profunda artery; profunda ligated at one end in wound; hæmorrhage recurred June 14th, and death on the same day.—Lieutenant J. T. Lowe, Co. D, 12th New Jersey, wounded at Bristoe Station, October 14, 1863; admitted into Third Division Hospital, Alexandria; gunshot wound of left thigh by conoidal ball; hæmorrhage to extent of twenty-four ounces from profunda artery; both ends of profunda femoris tied in the wound. Patient died October 30, 1863.—Corporal T. Machelent, Co. B. 140th New York, aged 27 years, wounded at the Wilderness, May 8, 1864; admitted into Mower Hospital, Philadelphia; missile entered middle of posterior surface of upper third of right thigh, passed in a direct line and emerged from inner surface; slight wound. July 4th, hæmorrhage to the extent of thirty ounces from the profunda artery; the proximal end of the artery was ligated in the wound. Patient was discharged May 31, 1865.—Private M. Murphy, Co. G, 5th Kentucky; wounded at Mission Ridge, November 25, 1863; admitted into hospital No. 4, Chattanooga; contused shell wound of left thigh. On January 1, 1864, gangrene appeared, which was checked, but reappeared on the 17th and 20th, and spread. On January 26th, the profunda gave way and was ligated by Surgeon A. H. Stephens, 6th Ohio. The patient died January 27, 1864.—Corporal T. Patterson, Co. D, 5th Michigan, aged 32 years, wounded at the Wilderness, May 5, 1864; admitted into the hospital at Chester, Pennsylvania; shot flesh wound of upper third of both thighs. On July 13th, bleeding occurred from a branch of the left profunda; one end of the artery was tied in the wound; hæmorrhage recurred on July 16th, and death ensued July 20, 1864, from pyæmia.

[2] Hamilton (F. H.), *A Treatise on Military Surgery and Hygiene*, 1865, p. 639.

[3] Lidell (J. A.), *On Gunshot Wounds of Arteries, Traumatic Hæmorrhage and Traumatic Aneurism*, in *Am. Jour. Med. Sci.*, 1864, Vol. XLVII, p. 110, and *San. Comm. Mem.*, Vol. I, p. 119.

There were also a few examples of ligations of large branches of the profunda involving very difficult and troublesome dissections; instances in which the external circumflex, posterior perforating, and anastomotica arteries were tied are here briefly noted. In several cases it was impracticable to determine what particular branch was severed:

CASE 107.—Private S. Michaels, Co. E, 9th Maine, aged 35 years, wounded at Petersburg, June 23, 1864. Surgeon J. J. Craven, U. S. V., reported his admission into the 2d division hospital of the Tenth Corps with a "gunshot wound of both thighs." Assistant Surgeon E. McClellan, U. S. A., reported from Hampton Hospital, Fort Monroe: "On July 30th, bleeding occurred from the descending branch of the external circumflex artery; six ounces of blood were lost. Assistant Surgeon E. Curtis, U. S. A., applied ligatures at both ends of the bleeding vessel in the wound—the injury was about the middle of the thigh. On August 4th, a hæmorrhage occurred from the femoral artery of the left thigh of about one pint; it was arrested by pressure, but the patient died from exhaustion a short time after."

CASE 108.—Private Theodore B. Benedict, Co. D, 7th Connecticut, age 32 years, wounded at Drury's Bluff, May 10, 1864. Assistant Surgeon E. McClellan reported from Hampton Hospital, Fort Monroe: "Gunshot wound of right thigh, flesh. On June 9th, hæmorrhage to the extent of eight ounces occurred from one of the posterior perforating arteries. The bleeding vessel was ligated in the wound at one end. The hæmorrhage did not recur." On July 25th, the patient was sent north. He was subsequently treated in McDougall Hospital, New York, and Knight Hospital, New Haven. Surgeon P. A. Jewitt, U. S.V., reported from the latter hospital that the patient died May 3, 1865, of pneumonia.

CASE 109.—Corporal Thomas Haglemeyer, Co. D, 41st Ohio, aged 49 years, was wounded at Nashville, December 16, 1864. Surgeon C. N. Hoagland, 71st Ohio, reported from the 3d division, Fourth Corps: "Gunshot wound of hip; simple dressings." Surgeon J. E. Herbst, U. S. V., reported that the patient was admitted into hospital No. 2, Nashville, December 22, 1864, with a "gunshot wound of the upper third of the right thigh. Wound gangrenous from Scarpa's triangle to the popliteal space. December 29th, separation of the slough caused hæmorrhage from the superior perforating and anastomotica arteries—oozing surface. The patient was much exhausted from repeated hæmorrhage—blood defibrinated. Acting Assistant Surgeon S. Blackwood applied proximal ligatures to the bleeding arteries in the wound and lint to the oozing surface. Simple dressings were applied, and iron and ale ordered. The patient died January 15, 1864."

Ligations of the Popliteal Artery.—Of seventeen cases of ligation of the popliteal for shot flesh wounds of the leg, thirteen were fatal, or 76.5 per cent. Five patients succumbed after amputation of the thigh following ligation of the popliteal. The series is enumerated in TABLE IV, and a case is detailed:

TABLE IV.

Summary of Seventeen Cases of Ligation of the Popliteal Artery for Hæmorrhage from Shot Injuries unattended by Fractures.

NO.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	INJURY, OPERATOR, AND RESULT.
1	Dittus, W., Pt., H, 42d Illinois, age 27.	May 14, June 6, 1864.	Right popliteal region; sloughing; both ends of popliteal art'ry tied in wound, by Ass't Surg. B. E. Fryer, U. S. A. Disch'd Aug. 16, 1865; pensioned.
2	Elliot, J. E., Corp'l, E, 2d Pennsylvania Cavalry, age 24.	April 1, 29, '63.	In'r side left leg; poplit'l art. lig., lower portion; hæm. recurred; thigh amp. May 5th. Died from shock two hours after operation.
3	Fletcher, J. M., Corp'l, C, 39th Massachusetts, age 28.	June 18, Aug. 14, 1864.	Flesh wound up. third right leg; sloughing; both ends artery tied in wound, by A. A. Surg. J. M. McGrath. Died Aug. 24, 1864, typhoid fever.
4	Gray, W., Pt., E, 18th Infantry, age 20.	Dec. 31, '62, Jan. 12, '63.	Near popliteal region; both ends artery tied in wound. Died Jan. 22, 1863, gangrene.
5	Kausche, G., Pt., D, 20th New York, age 35.	Sept. 17, 17, '62.	Laceration of right poplit'l space; up. end art. tied in wound; hæm. recurred. Disch'd Aug. 13, '63.
6	Kraher, J. P., Pt., D, 6th New York Heavy Artillery, age 35.	June 1, July 24, 1864.	Left thigh near knee; gang.; one end of artery tied in wound. Disch'd Mar. 15, '65; pensioned.
7	Leonard, J., Pt., L, 7th New York Heavy Artillery, age 21.	May 30, July 3, 1864.	Left leg; art. tied beh. knee; hæm. recur'd; thigh amp. just above knee July 8. Died July 23,'64.
8	Lynch, J., Corp'l, K, 146th N. York, age 34.	May 10, 17, '64.	Left popliteal region; lig. poplit'l, by Ass't Surg. C. A. McCall, U. S. A. Died May 23,'64, pyæmia.
9	*Selden, B.*, Pt., H, 9th Virginia Cav., age 23.	July 8, 27, '63.	Left post. tib. art. wounded; popliteal tied, by A. A. Surg. W. S. Adams. Died Aug. 2,'63, pyæm.
10	Smith, A. M., Serg't, F, 20th Maine.	May 15, 15, '64.	Wound of popliteal artery; art'y tied. Died May 22, 1864.
11	Smith, F., Pt., B, 1st Mass. Heavy Artillery.	May 23, June 29, 1861.	Rt. and l'ft thighs; hæm. from post. tib.; rt. post. tib. lig. in continuity; hæm. recurred; poplit'l lig. Died June 29, 1864.
12	Smith, P. D., Pt., C, 8th Iowa Cavalry, age 20.	Mar. 19, May 6, 1864.	Right ankle; gang.; hæm. from post. tib. art'y; poplit'l art'y lig. in continuity, by A. A. Surg. D. McLean. Disch'd Mar. 21, 1865.
13	Taber, J. A., Serg't, E, 5th Michigan, age 23.	Mar. 31, April 12, 1865.	Right leg; poplit'l art'y lig. in contin'ty, by Surg. J. C. McKee, U.S.A. Died April, 18, '65, hæm.
14	Vann, D., Pt., B, 8th New York Artillery, age 18.	June 3, 16, '64.	Left poplit'l art y injured; art'y lig., by Surg. R. B. Bontecou, U. S. V.; hæm. recurred; new lig. applied June 20; same day amp. thigh. Died June 22, 1864, gangrene.
15	Walker, M., col'd servant, K, 58th Penn., age 13.	June 3, 26, '64.	Right poplit'l art'y injured; vessel tied above bleeding point, by Surg. R. B. Bontecou, U. S. V. Died July 3,'64, diarrhœa. [See CASE 107.]
16	Wick, J. C., Pt., C, 155th Pennsylvania, age 22.	Mar. 25, May 23, 1865.	Both thighs; left poplit'l art'y tied above and below, by Ass't Surg. A. Delany, U. S. V.; June 14, amp. thigh. Died June 20, '65.
17	Wild, C. B., Corp'l, E, 114th New York.	Sept. 19, Oct. 1, 1864.	Right thigh thro' poplit'l space; lig. of poplit'l; hæm. recurred; Oct. 12, amp. thigh. Died Oct. 13, 1864, of exhaustion.

[1] This is probably the case referred to by Prof. A. C. POST, in the *Addendum to Section I of the Surg. Mem. of the War of the Rebellion, pub. by the U. S. San. Comm.*, 1870, Vol. I, p. 262.

CASE 110.—M. Walker, a colored servant of the 58th Pennsylvania Volunteers, aged 13 years, was wounded at Cold Harbor, June 3, 1864, by a minié ball, which entered on the inner side of the lower third of the right thigh, passed through the popliteal space, injuring the popliteal artery, and making its exit latterly. Twelve days after the reception of the injury he was admitted to Harewood Hospital, Washington. Hæmorrhage to the amount of from three to five ounces took place on June 25th, and was controlled by pressure. On the following day hæmorrhage recurred, and the popliteal artery was ligated by Surgeon R. B. Bontecou, U. S. V., by enlarging the wound of entrance, the patient being under the influence of sulphuric ether. The leg was placed in Smith's anterior splint with a fenestra opposite the wound to facilitate dressing, and a supporting treatment was ordered. The patient exhibited typhoid symptoms with very profuse diarrhœa until death, which occurred July 3, 1864. An autopsy showed that the coats of the artery had been injured by the ball, causing sloughing and the subsequent hæmorrhage. The history was reported by the operator.

Ligations of the Posterior Tibial Artery separately.—In a series of seventeen ligations of the posterior tibial artery for shot wounds of the soft parts of the leg and foot, thirteen recovered, or 76.5 per cent. Three patients submitted to consecutive amputation, of whom one died. The cases are enumerated in TABLE V:

TABLE V.

Summary of Seventeen Cases of Ligation of the Posterior Tibial Artery for Hæmorrhage from Shot Injuries unattended by Fractures.

No.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	INJURY, OPERATOR, AND RESULT.	No.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	INJURY, OPERATOR, AND RESULT.
1	Ball, J. D., Corp'l, A, 125th New York, age 24.	May 12, 28, '64.	Right post. tib. artery wounded; artery tied in wound, by Ass't Surg. A. Ingram, U. S. A. Discharged Dec. 29, '64; pens'd.	9	Ingalls, H. B., Pt., L, 1st Maine Cavalry, age 25.	Mar. 31, April 9, 1865.	Right leg; post. tib. artery lig., by Surg. E. Griswold, U. S. V. Disch'd Aug. 12, 1865; pens'd.
2	Brown, W. H., Bugler, 5th New Jersey Battery, age 25.	May 24, June 10, 1864.	Left leg; posterior tibial art. tied. Died July 7, 1864, pyæmia.	10	Maran, M., Pt., A, 2d New Jersey Cavalry, age 20.	Feb. 11, 27, '64.	Right leg; gang.; posterior tibial art. ligated on ulcerated surface, by A. A. Surgeon S. S. Jessop. Disch'd Oct. 21, 1865; pens'd.
3	*Bucker, J. F.*, Pt., B, 1st Confederate, age 21.	April 6, 16, '62.	Right leg; posterior tibial artery tied. Recovered.	11	Oakley, C. N., Pt., A, 85th New York, age 32.	March 8, 8, 1865.	Left leg; lig. post. tib. and peroneal arteries. Died Mar. 23, '65.
4	Dow, J. A., Pt., E, 136th New York, age 20.	June 20, 20, '64.	Right posterior tibial art. severed; vessel tied, by Surgeon I. N. Himes, 73d Ohio. Disch'd June 13, 1865; pensioned.	12	Rigbey, T., Pt., C, 9th N. Hampshire, age 23.	June 20, J'y 3, '64.	Left leg; post. tib. artery tied at wound. Furl'd Aug. 11, 1864.
5	Emery, R., Pt., D, 5th Vermont, age 33.	May 5, Aug. 4, 1864.	Left leg; gang.; ends of art'y tied in wound, by A. A. Surg. J. B. Crandall. Disch'd Dec. 16, '64; pens'd; Aug. 28, '65, amp. leg.	13	[1]Ritter, D. T., Corp'l, F, 208th Pennsylvania, age 19.	Mar. 25, April 7, 1865.	Left post. tib. art. wounded; both ends of vessel ligated, by Surg. G. L. Paneoast, U. S. V. Discharged June 27, 1865; pens'd.
6	Flannagan, H. A., Sergeant, H, 16th Penn. Cav., age 25.	April 7, May 14, 1865.	Left posterior tib. art'y wounded; vessel tied at its middle third. Died June 15, 1865, erysipelas.	14	Sherdan, J., Pt., D, 68th Pennsylvania, age 31.	July 3, 25, '63.	Right leg; posterior tibial artery tied at both ends. Discharged Feb. 6, 1865; pensioned.
7	Gilmore, M., Pt., B, 96th Illinois, age 22.	Aug. 3, 3, '64.	Left leg, involving posterior tib. artery; vessel tied, by Surgeon S. H. Kersey, 36th Indiana. Disch'd Jan. 10, 1865; pens'd.	15	Thompson, S., Pt., E, 4th N. Jersey, age 23.	Sept. 22, Oct. 19, 1864.	Right leg; both ends of posterior tibial artery ligated in wound, by A. A. Surg. J. W. Kerr. Duty March 30, 1865.
8	Hagey, J. D., Pt., I, 138th Pennsylvania, age 24.	April 2, May 8, 1865.	Left posterior tibial art. opened; one end of artery tied in wound, by A. A. Surg. H. M. Bellows; sloughing; May 19, amp. leg, by A. A. Surg. H. A. Drane. Discharged July 26, 1865; pens'd.	16	Trowbridge, D. A., Corporal, L, 5th Illinois Cavalry.	July 8, Sept. 23, 1863.	Right leg; artery ligated in wound. Disch'd Nov. 17, 1863.
				17	Wright, E., Pt., F, 119th Pennsylvania, age 18.	May 5, 23, '64.	Ball cutting right post. tibial art.; gang.; art. tied in wound, by Surg. E. Bentley, U. S. V.; May 25, hæm. recur'd; leg amp. Died May 28, '64, usthenia and pyæm.

Ligations of the Anterior Tibial Artery.—Of ten cases of ligation in which the anterior tibial was separately tied, seven were successful, one after consecutive amputation. The cases are here briefly noted:

CASES 111–120.—Captain C. C. Brewster, Co. D, 10th Connecticut, aged 45 years; wounded at Bermuda Hundred, May 16, 1864; shot flesh wound of left leg. Admitted into Chesapeake Hospital, Fort Monroe, May 21st. Bleeding from the anterior tibial artery to the amount of eight ounces occurred. The vessel was ligated in the wound at the cardial end. Hæmorrhage did not recur. Discharged September 19, 1864, and pensioned. Examiner C. C. Jarvis, of Hartford, reported, August 24, 1869: "The wound is now an open, deep ulcer; occasionally pieces of bone come out from some part of the sore." Pensioner died June 17, 1873, of phthisis pulmonalis.—Private W. Brommel, Co. E, 15th New York Artillery, aged 30 years; wounded at Boydton Plank Road, March 31, 1865; shot wound of left leg, lower third. Admitted into Columbian Hospital, Washington. Hæmorrhage from anterior tibial artery; vessel ligated by Acting Assistant Surgeon S. W. Briggs. Died May 2, 1865, from exhaustion from loss of blood.—Corporal T. Condon, Co. C, 2d New York Artillery, aged 21 years; wounded at Deep Bottom, August 16, 1864; shot flesh wound of the middle third of the right leg; the ball entered the posterior portion of the leg and made its exit at a corresponding point anteriorly. Admitted into Satterlee Hospital, Philadelphia. Hæmorrhage, August 26th, Ligation of anterior tibial artery above and below bleeding orifice by Acting Assistant Surgeon W. F. Atlee. Collateral circulation re-established in twenty-four hours. Discharged July 26, 1865, and pensioned. The New York Examining Board reported, March 4, 1876: "There is a cicatrix three and a half inches in length on anterior surface of right leg; the ball emerged through

[1] The case numbered 13 in TABLE V is detailed by Professor A. C. POST in the *Surg. Memoirs of the U. S. San. Comm.*, Surgical Vol. I. p. 262.

the calf. Both cicatrices are adherent and interfere with locomotion and the strength of the limb."—Sergeant M. C. Glass, Co. F, 16th Michigan, aged 24 years; wounded at Hatcher's Run, February 7, 1865; shot wound of right anterior tibial artery. Admitted into Jarvis Hospital, Baltimore. Ulceration and hæmorrhage; six ounces of blood lost. Ligation of anterior tibial artery in continuity, February 20, 1865. Died February 28, 1865, of hæmorrhage.—Private J. L. Renshaw, Co. H, 191st Pennsylvania, aged 28; wounded at Petersburg, June 24, 1864; shot flesh wound of left leg by a conoidal ball; sloughing and hæmorrhage from anterior tibial artery to extent of eight ounces. Ligation of artery above and below wound. The patient recovered, and was discharged May 18, 1865.—Private S. Riley, Co. H, 92d New York, aged 24; wounded at Cold Harbor, June 1, 1864; conoidal ball passed through the integument of the left leg one inch below the knee. June 25th, sloughing and erysipelas. July 8th, recurrent hæmorrhage to the extent of six ounces from the anterior tibial artery. The artery was tied in the wound. The patient was discharged February 9, 1865, and pensioned. Examiner H. O. Hitchcock, of Kalamazoo, reported, June 8, 1867: "Ball passed below the patella and under the ligament. The wound was followed by gangrene and large sloughing, and now there is an extensive cicatrix, causing lameness and great weakness of the knee." Examiner J. A. Brown, of Detroit, reported, September 28, 1869: "Gunshot wound of left knee, the ball striking the inner condyle of the tibia and the patella, causing weakness and impaired motion of the knee, mostly from contraction of the cicatrix." Examiner D. F. Wooley, of Big Rapids, reported, April 1, 1875: "Ball entered at upper and inner third of the tibia, passing directly in front and under the patella and out, severing the attachment of the lower end of the patella and fracturing the upper end of the tibia; resulting in loss of part of upper portion of the tibia and weakening of knee joint to a serious extent, with slight adhesions of the muscles; on the whole seriously impeding locomotion and requiring care to maintain a standing position upon it." The pensioner was paid March 4, 1876.—Corporal I. Sampson, Co. F, 1st Massachusetts Cavalry, aged 35, was wounded during Sheridan's raid, May 11, 1864; shot wound of right leg, middle third, outside. Admitted into Hammond Hospital, Point Lookout. Gangrenous sloughing set in, destroying the coats of the anterior tibial artery. June 28th, hæmorrhage to the extent of four ounces from the anterior tibial artery. Both ends of artery tied in the wound by Acting Assistant Surgeon T. Liebold. The bleeding did not recur. The patient recovered, and was mustered out October 16, 1864. Examiner W. H. Page, of Boston, reported, April 11, 1865: "Ball struck about the middle of the left leg, fracturing and splintering the tibia, a large part of which, at seat of injury, has been removed, and there is a deep cicatrix three inches by one and a half. The whole leg is much swollen and œdematous, and there is probably more dead bone to be removed." The Boston Examining Board reported, December 2, 1874: "Ball entered middle third of leg anteriorly and passed directly through. The tibia was shattered, and necrosis has resulted therefrom. The leg is weak and the wound is still open, an ulcer at the time of examination existing the size of a five-cent piece, surrounded by an areola four inches in diameter and somewhat eczematous. His leg is painful and weak upon long standing, and this interferes with the performance of manual labor." In September, 1875, the Board reported: "Large adherent cicatrix, inflamed and very tender; anchylosis of ankle." Pensioner paid June 4, 1876.—Private W. Saulsbury, Co. K, 39th U. S. C. T., aged 36; wounded at Petersburg, July 30, 1864; flesh wound of lower third of right leg. He was admitted into Summit House Hospital, Philadelphia. Secondary hæmorrhage; ligation of anterior tibial artery January 19, 1865. Amputation of right leg at lower third by double-flap method. Transferred to hospital at Beverly, and discharged May 26, 1865. He died July 16, 1871.—Private J. Skiffington, Co. I, 2d New York Heavy Artillery, aged 28; wounded at Petersburg, June 16, 1864; flesh wound of lower third, right leg. Admitted into Satterlee Hospital, Philadelphia; wound sloughing. Acting Assistant Surgeon W. F. Atlee ligated both ends of the anterior tibial artery in the wound, on account of hæmorrhage, July 28, 1864. The patient died August 29, 1864, of pyæmia.—Private *L. Weaver*, Co. G, 4th Virginia, aged 23; wounded at Gettysburg, July 3, 1863. Admitted into Twelfth Corps Hospital. Shot flesh wound of both legs and face. July 13th, bleeding of eight ounces from the anterior tibial artery, which recurred on the 14th, sixteen ounces of blood being lost. The anterior tibial artery was tied above and below the point of division. The patient was paroled November 12, 1863.

Ligations of the Anterior and Posterior Tibial Arteries.—There were two instances in which the posterior and anterior tibial arteries were conjointly tied for shot flesh wounds:

Cases 121–122.—Private J. Hoar, Co. G, 144th New York, aged 22 years, wounded at White Plains, July 24, 1863. Shot wound of right foot; admitted into Douglas Hospital, Washington; hæmorrhage to the extent of six ounces occurred from the metatarsal artery on August 1st. Assistant Surgeon W. Thomson, U. S. A., ligated the anterior tibial artery in the continuity at the instep and the posterior tibial behind the malleolus. The wounds healed well, and the patient was returned to duty from Central Park Hospital, New York, April 11, 1864. He is not a pensioner.—Private J. Kercher, Co. D, 7th Michigan Cavalry, wounded at Gettysburg, July 2, 1863. Shot wound of right leg and of anterior and posterior tibial arteries; admitted into McDougall Hospital, New York Harbor. July 29th, ligation of anterior and posterior tibial arteries. August 10th, hæmorrhage, amounting to thirty-two ounces of blood. Died August 10, 1863.

Ligation of Veins.—Six cases in which the femoral vein was tied simultaneously with the artery are noted on page 38. Specimens from two of the cases are shown in Figures 15 and 19. A case of ligation of the saphenous vein is detailed:

Case 123.—Private A. Kendig, Co. B, 97th Pennsylvania, aged 31 years, wounded at Bermuda Hundred, May 18, 1864. Assistant Surgeon E. McClellan, U. S. A., reported from Hampton Hospital, Fort Monroe: "Gunshot wound of left thigh, inner surface, upper third; the ball entered near the apex of Scarpa's space, passed through the adductor longus muscle, and made its exit over the upper third. Gracilis muscle wounded; phagedæna. On May 24th, hæmorrhage to the extent of six ounces occurred from the saphenous vein. Both extremities of the vein were ligated in the wound. The hæmorrhage did not recur, but the patient sank and died of exhaustion June 4, 1864."

Amputations following shot flesh wounds will next be considered.

EFFECTS OF HOSPITAL GANGRENE

Amputations in the Lower Limbs after Shot Flesh Wounds.—Two hundred and one cases were reported of amputations in the lower extremity for shot wounds involving only the soft parts, comprising one hundred and thirty-one amputations in the thigh, six disarticulations at the knee, sixty-three amputations at the leg, and one of the toes.

Amputations in the Thigh.—In the hundred and thirty-one cases of this series, ninety-four or 71.7 per cent. were fatal. The cases are enumerated in TABLE VI. Ten of the operations were primary, with only two recoveries. Fifty-seven intermediary operations, with forty-eight deaths, gave a mortality rate of 84.2 per cent.; sixty-four secondary operations, with thirty-eight deaths, had a death-rate of 59.4 per cent. The amputations were necessitated for the most part by complications of consecutive hæmorrhage, gangrene, or secondary disease of the bone or joints, and in some instances were resorted to after ligations, removals of sequestra, or other interference had been unavailingly employed:

CASE 124.—Private H. Root, Co. B, 104th New York, aged 26 years, was wounded at Petersburg, June 22, 1864, and admitted to the field hospital of the 3d division, Fifth Corps. Surgeon L. W. Read, U. S. V., noted, "buckshot flesh wound of right leg, slight." On June 30th, the patient entered the Harewood Hospital, Washington, whence Surgeon R. B. Bontecou, U. S. V., contributed the specimen (FIG. 21), with the following brief history: "Gunshot wound of right leg, middle third, injuring soft parts. On admission the constitutional state of the patient was very poor; condition of injured parts tolerably good, but wound very painful. The parts subsequently became gangrenous, with rapid sloughing of soft parts; about one half of the lower third, and three-fourths of the upper third, and all of the middle third of the tibia exposed and denuded of periosteum. The tibia became necrosed throughout its whole extent, and at this time the patient became jaundiced. On October 29th, about ten inches of necrosed bone was extracted by Acting Assistant Surgeon D. I. Evans. The general condition of the patient improved soon afterwards, under a supporting treatment throughout, and was doing tolerably well, parts improving, when transferred to hospital at Elmira, January 4, 1865." Two weeks after his transfer the patient obtained a furlough and proceeded to his home in Tioga County, New York, where his limb was subsequently amputated at the middle third of the thigh. Dr. S. Knapp, his attending physician, certified that "he found him suffering from a badly cared for and neglected wound," etc., and that "on February 28, 1865, it became necessary to amputate the leg," which operation he performed, being assisted by Dr. E. Daniels. About two months afterwards the patient returned to the hospital, and on July 21, 1865, he was discharged from service and pensioned. He died July 25, 1870, of consumption, resulting from the wound and its effects, more than five years after the amputation. The parts removed by the amputation at mid-thigh by Dr. Knapp were not transmitted to the Museum; but the large sequestrum comprising the greater part of the diaphysis of the tibia is represented in the wood-cut (FIG. 21), and, as mounted, is nine inches in length (see *Catalogue of the Surgical Section of the Army Medical Muesum*, Washington, 1866, p. 405).

FIG. 21.—Sequestrum of right tibia. *Spec.* 3601.

In a grave case of hospital gangrene following a shot wound at the ankle, the lamented artist, Hospital Steward E. Stauch, made a colored drawing of the appearances after the sloughing surfaces had cleaned off under the applications of fermented cataplasms. The drawing is copied in the chromolithograph opposite, PLATE XXVII.

CASE 125.—Corporal C. H. Dudley, 11th Indiana Battery, received at Chicamauga, September 20, 1863, a wound of the right foot, a conoidal ball entering the under portion just below ankle joint. He was taken prisoner, conveyed to Richmond, and on October 29, 1863, was admitted to Division No. 1 hospital, Annapolis, from the steamer New York. The wound had sloughed extensively. On October 30th and 31st there was hæmorrhages from the dorsalis pedal artery, which was promptly arrested by the use of styptics. Soon after admission a phagedenic ulcer made its appearance on the posterior face of the right leg, immediately below knee joint, and an examination, made November 19, 1863, revealed a deeply excavated sloughing wound. Yeast poultices were applied to the sloughing tissues, and when the gangrenous masses had cleaned off a colored drawing was made of the parts by Hospital Steward E. Stauch. November 23d, hæmorrhage amounting to eight ounces occurred from this wound, and was restrained by finger compression on the femoral artery; tourniquet was loosely applied on limb, and stimulating draughts given. On November 24th, Assistant Surgeon W. S. Ely, U. S. V., who had charge of the case, reports that the "wound from which the hæmorrhage proceeded was thoroughly examined and the diseased tissues found more extensive than had been supposed; the finger could be passed beneath superficial border of ulcer to a considerable extent, and the popliteal artery was found to be divided by the extent of the ulcerative process, and the ligamentous structures of the knee joint were found extensively destroyed. Amputation was determined on as the only rational treatment. It was immediately performed, after the circular method, directly above the knee joint, by Surgeon T. A. McParlin, U. S. A., assisted by Surgeon B. A. Vanderkieft, U. S. V. Patient bore the operation well, and the tissues at seat of amputation appeared healthy. No sutures were used to approximate the flaps, wet straps being the only retentive treatment employed." The case progressed favorably until December 2d. Acting Assistant Surgeon C. Hayes kept the further record of the case. On December 8, 1863, hæmorrhage, amounting to eight ounces, occurred from the stump. He failed rapidly after this, and died December 11, 1863. *Surgical Series of Drawings*, Nos. 59, 60, S. G. O., PLATE XXVII.

TABLE VI.

Numerical Statement of One Hundred and Thirty-one Amputations in the Thigh for Shot Injury unattended by Fracture.

No.	Name, Military Description, and Age.	Dates.	Injury, Operator, and Result.
1	Atwood, H., Pt., K, 14th New Hampshire.	Sept. 19, 23, '64.	Right fem. art. injured; circulat'n destroyed; gang.; circ. amp. at low. third thigh, by A. Surg. W. Fritz, 12th Mo. Died Sept. 30, '64.
2	Baker, J., Pt., A, 11th Connecticut, age 32.	June 15, 26, '64.	Sheath of right fem. art. wounded; hæm. from branch of profunda; flap amp. thigh, by A. A. Surg J. S. Hill. Died June 29, 1864.
3	Barkeloo, J., Pt., M, 2d Ohio Cavalry, age 28.	July 19, 26, '63.	Right popliteal artery severed; fem. art. ligated; flap amp. thigh at up. third. Disch'd Mar. 17, '65.
4	Barnum, C. F., Pt., E, 187th Penn., age 30.	June 18, Sept. 7, 1864.	Left leg; amp. bel. tubere. of tibia; hæm.; amp. thigh, circ., lo. third, by A. A. Surg. J. Morris. Died Oct. 13, '64. *Spec.* 3132, A. M. M.
5	Barry, E., Pt., A, 82d Penn., age 24.	June 3, Aug. 11, 1864.	Left leg; flap amp. at mid. third, by Dr. J. Shields. Discharged Sept. 2, 1865.
6	Blaker, J. P., Pt., E, 15th Infantry, age 18.	Aug. 7, Sept. 16, 1864.	Left leg; gang.; ant. post., lower third thigh, by A. A. Surg. R. W. Forrest. Died Sept. 18, 1864, exhaustion.
7	Brasted, A. A., Serg't, H, 96th New York, age 22.	June 1, Nov. 7, 1864.	Right knee joint; gang.; joint opened; circ., low. third thigh, by A. A. Surg. A. J. Smith. Died Nov. 30, 1864, exhaustion.
8	Bell, J. C., Pt., E, 34th Iowa, age 23.	April 6, 18, '65.	Left posterior tibial artery cut by ball; gang.; hæm.; lig. of fem. artery; amp. at low. third thigh, by A. A. Surg. L. M. Cowan. Died April 23, '65, exhaustion.
9	Belt, W. H. H., Pt., A, 10th Ohio Cavalry, age 21.	Feb. 10, April 21, 1863.	Shot perforation left thigh; erysipelas; flap amp. at mid. third, by Surg. J. R. McClurg, U.S.V. Disch'd Sept. 2, 1863.
10	Bishop, J., Pt., M, 22d New York Cavalry, age 20.	Aug. 25, Sept. 6, 1864.	Right leg, destroying post. tibial artery, vein, and nerve; hæm.; thigh amp. at low. third, by A. A. Surg. W. J. Mellench. Died Sept. 15, 1864, pyæmia.
11	Black, J. M., Corp'l, D, 35th Ohio, age 21.	July 20, Aug. 15, 1864.	Right leg; gang.; flap amp. thigh, low. third, by A. A. Surg. J. E. Crowe. Died Aug. 18, '64, exh'n.
12	Blaisdell, H., Pt., H, 58th Pennsylvania.	April 20, June 28, 1863.	Right leg near knee; no fracture; thigh amp. at middle third, by Surg. J. F. Gallowpe, 17th Mass. Died July 10, 1863.
13	Boies, J. A., Lieut., H, 13th Infantry, age 22.	May 22, June 18, 1863.	Left knee, by spent shot; pyæmia; amp. of thigh at upper third. Died June 28, 1863.
14	Brockman, H., Pt., I, 6th Kentucky.	April 6, June 26, 1862.	Right femoral artery cut; double flap amp. thigh. Disch'd Aug. 9, 1863.
15	[1]*Burke, W.*, Pt., B, 24th Alabama.	Sept. 19, 23, '63.	—— thigh; gangrene; thigh amp. Died Sept. 23, 1863.
16	*Burroughs, H. C.*, C, 7th C. S. Cavalry.	April 1, May 15, 1865.	Poplit'l space, r't leg; gang.; circ. amp. thigh, by Surg. W. Hayes, U.S.V. Died May 17, '65, gang.
17	Butler, H., Pt., H, 1st New York Artillery, age 21.	June 1, Aug. 5, 1864.	Left leg just below poplit'l space; gang; amp. thigh, by A. A. Surg. W. C. Way. Died Aug. 6, '64.
18	Cameron, J., Serg't, K, 31st Maine, age 27.	June 20, '64, July 5, '66.	Right thigh; ch. arthritis; double flap, thigh, by Ass't Surg. H. E. Brown, U. S. A. Recovery.
19	*Carroll, R. A.*, Pt., F, 3d Alabama, age 19.	July 3, Nov. 29, 1863.	Right leg; doub. flap amp. thigh, by A. A. Surg. J. E. Steele; hæmorrhage; fem. art'ry ligated. Died Feb. 17, 1864, pyæmia.
20	Case, E. F., Pt., G, 13th Michigan.	Sept. 19, 26, '63.	Left fem. artery severed; gang.; Sept. 24, amp. leg four inches below knee; 26th, thigh amp. at upper third. Died Sept. 27, '63.
21	Chapman, C. H., Serg't, E, 15th New Hampshire, age 26.	Sept. 30, '64, Apr. 7, '65.	Right thigh; gang., destroying profunda art'y; hæm.; circ. amp. up. third, by Surg. R. I. P. Goodwin. Died five hours after ope'n.
22	Chapman, J. S., Pt., E, 4th Maine, age 33.	June 18, July 5, 1864.	Left knee; amp. post. flap, thigh, by Surg. E. Bentley, U. S. V. Died July 6, 1864, exhaustion.
23	Chawgo, M. W., Pt., H, 40th New York, age 21.	May 13, 17, '64.	Right leg; gang.; hæm.; amp. at low. third, by Asst. Surg. C. A. McCall, U. S. A. Died May 19, 1864, pyæmia.
24	Cheseltine, W. C., Pt., C, 1st Maryland Cavalry, age 22.	May 27, June 4, 1864.	Right thigh, severing fem. vein; gang.; circ. amp. thigh, by Asst. Surg. W. F. Norris, U. S. A. Died June 9, 1864, exhaustion.
25	Christ, J., Corp'l, M., 198th Penn., age 27.	Mar. 25, April 7, 1865.	Right thigh; circ. amp. thigh, by A. A. Surg. J. H. Gillman. Died April 25, 1865, pyæmia.
26	Cook, L., Serg't, C, 26th Ohio, age 25.	June 18, Aug. 10, 1864.	Right thigh. Aug. 9, hæm.; amp. post. flap, mid. third, by A. A. Surg. E. H. Sands. Died Aug. 11, 1864.
27	Cooper, T., Pt., C, 4th Penn. Reserves, age 18.	June 22, '64, May 3, '76.	Left thigh and leg; contraction of muscles; Dec. 31, hamstring tendons divided. Disch'd June 23, '65; leg deform'd and paraly'd; amp. above knee, by Surg. O. Pemberton, F. R. C. S., of Birmingham, England.
28	Curtis, J. A., Pt., D, 101st Ohio, age 25.	June 27, Aug. 7, 1864.	Right thigh; gang.; flaps of skin, cir. of muscles, by Surg. S. E. Fuller, U. S. V. Died Aug. 15, 1864, pyæmia.
29	Curtis, G., Pt., A, 1st Colored Troops, age 23.	Oct 27, Nov. 19, 1864.	Shell contusion of right thigh and leg; gang.; amp. thigh, by Asst. Surg. J. H. Frantz, U. S. A. Died Jan. 13, 1865, pyæmia.
30	Danielson, H. A., Pt., G, 7th Minnesota, age 23.	Dec. 16, '64, Feb. 11, '65.	Left thigh; gang.; amp. thigh, by A. A. Surg. S. W. Thompson. Disch'd August 16, 1865.
31	Darling, S. G., Pt., D, 32d Maine, age 19.	May 12, 26, '64.	Right fem. artery severed; artery tied on field; gang.; thigh amp. by Surg. R. B. Bontecou, U.S.V. Died May 26, '64, hæmorrhage.
32	Decker, E., Pt., H, 81st Ohio.	July 22, 1864.	—— fem. art. wounded; primary amputation of thigh. Died Aug. 3, 1864.
33	Deinlein, D., Pt., C, 5th Ohio, age 43.	May 25, July 10, 1864.	Right popliteal space, producing aneurism; amp. thigh, by A. A. Surg. O. D. Norton. Died Aug. 1, 1864, in low typhoid condition.
34	Delamater, M., Corp'l, G, 7th Mich. Cavalry, age 20.	May 28, July 12, 1864.	Right thigh; gang.; hæm.; July 10, femoral ligated; amp. thigh, by Asst. Surg. H. M. Sprague, U.S.A. Died Aug 7, '64. py'mia.
35	Deniker, D. H., Pt., E, 2d Maryland, age 20.	Sept. 26, 28, '64.	Right leg; thigh amp. at lower third, by A. A. Surgeon M. M. Townsend. Died Sept. 29, '64.
36	Dodge, W. M., Serg't, F, 137th New York, age 45.	July 2, 10, '63.	Right leg; gang.; hæm.; amp. thigh, by Surg. H. E. Goodman, 28th Penn. Died July 13, '63.
37	Doyle, L., Pt., K, 8th Maine, age 34.	May 20, June 6, 1864.	Right thigh perforated; June 1, hæm; fem. ligated; recurred; amp. thigh, by Asst. Surg. W. H. Gardner, U. S. A. Died June 6, 1864, exhaustion.
38	Drilling, H., Pt., C, 124th New York, age 30.	Oct. 26, Nov. 1, 1864.	Right fem. vein and art'ry wounded; hæm.; amp. thigh, by Surg. D. W. Bliss, U.S.V. Died Nov. 21, 1864, pyæmia.
39	Dudley, C. H., Corp'l, 11th Indiana Battery.	Sept. 20, Nov. 24, 1863.	Right foot; gang., involving popliteal artery; hæm.; amp. thigh, by Surg. T. A. McParlin, U.S.A. Died Dec. 11, '63, hæm., debility.
40	[2]Dutcher, J. H., Pt., M, 2d New York Heavy Artillery.	May 31, June 5, 1864.	Left popliteal artery divided near end; gang.; thigh amp., by Surg. J. A. Lidell, U.S.V. Died June 8, '64, exhaustion.
41	Dyer, G. A., Serg't, G, 6th Maine, age 21.	Nov. 7, '63, Feb. 19, '64.	Right thigh; amp. thigh, by Surg. D. W. Bliss, U. S. V. Disch'd April 19, '64. *Spec.* 2047, A.M.M.
42	Edwards, C. S., Pt., G, 57th Indiana.	Dec. 31, '62, May 26, '63.	Left leg; amp. thigh, by A. A. Surgeon J. B. Burns. Disch'd Aug. 23, 1863.
43	Elliot, J., Corp'l, E, 2d Pennsylvania Cavalry, age 24.	April 2, May 5, 1863.	Left leg; hæm.: April 29, popliteal artery ligated: hæm. recurred; amp. thigh. Died May 5, 1863, from shock, 2 hours after amp.
44	*Farder, J.*, Pt., 1st N. Carolina Cavalry, age 25.	June 20, Sept. 1, 1864.	Right thigh and left leg; amp. left thigh, by Surg. H. L. W. Burritt, U. S. V. Died Sept. 2, '64.
45	Feary, G. M., Pt., B, 108th New York.	July 2, 14, '63.	Right thigh, severing fem. artery; hæm.; gangrene; amp. of thigh. Died July 24, 1863.

No.	Name, Military Description, and Age.	Dates.	Injury, Operator, and Result.
46	Fenton, C., Serg't, E, 1st Penn., age 25.	May 6, 22, '64.	Left thigh, wound'g profunda art.; frequent hæms.; amp. thigh, by Surg. R. B. Bontecou, U. S. V. Died May 22, '64, exhaustion.
47	Foss, A. J., Pt., F, 13th N. Hampshire, age 21.	April 27, M'y 8, '63.	Right leg; gang.; amp. thigh. Died May 8, 1863.
48	*Foust, J.*, Pt., —, North Carolina Artillery, age 37.	Mar. 27, June 17, 1865.	Left knee, not involv'g joint; extensive suppurat'n involv'g joint; amp. thigh, by A. A. Surg. J. Gilman; hæm.; artery lig.; July 10, pyæmia. Died J'y 25, '65, exh'n.
49	Gardner, G. W., Serg't, H, 12th Illinois Cavalry, age 29.	Oct. 11, 29, '63.	Right fem. artery injured; gang.; amp. thigh, by A. A. Surg. W. H. Ensign. Died Dec. 5, 1863, debility. *Spec.* 1760, A. M. M.
50	Goldsborough, H. J., Pt., B, 31st Illinois.	June 26, Dec. 16, 1863.	Left knee; ulceration of articular surface of bone; amp. thigh, by A. A. Surg. J. D. Davis. Died April 15, 1864.
51	Gooding, H. P., Pt., H, 10th Michigan Cav'ry.	Jan. 30, Feb. 27, 1865.	Left knee; extensive suppurat'n, joint disorg'zed; flap, low. third, by A. A. Surg. T. W. Branch. Died March 4, 1865; pyæmia.
52	Hasey, W. H. H., Serg't, E 20th Maine, age 23.	July 1, 30, '64.	Right leg; gang. and hæm.; amp. thigh, by A. A. Surg. H. B. Maben. Died Sept. 28, '64, exh'n.
53	Haskell, A. M., Corp'l, K, 12th Maine, age 23.	Oct. 19, Nov. 15, 1864.	Right knee; amp. post. flap, junc. lower third, by A. A. Surg. W. Kempster. Nov. 21, hæm.; lig. fem.; hæm. 27th and 30th. Died Dec. 1, 1864, exhaustion.
54	*Haynes, A.*, Major, 29th Virginia.	May —, 27, '64.	Right fem. art. injured; single flap amp. of thigh. Died May 30, '64.
55	[1]*Hembery, A. J.*, —, K, 4th Alabama.	Sept. 19, Oct. 1, 1863.	Lower portion popliteal space; hæm. from poplit'l art.; amp. just above knee. Died end third day.
56	Hickey, J., Pt., C, 22d Massachusetts, age 19.	July 2, Aug. 5, 1863.	Right leg, follow'd by trau. aneur. of ant. and post. tibial arteries; hæm.; gang.; amp. thigh, by Surg. C. W. Jones, U. S. V. Died Aug. 16, '63. *Spec.* 1698, A. M. M.
57	Hogstead, F., Corp'l, A, 187th New York, age 21.	Feb. 7, 26, '65.	Left leg; amp. thigh, by A. A. Surgeon R. Westerling. Died March 8, 1865.
58	Hopper, B., Pt., F, 64th New York, age 28.	May 12, June 16, 1864.	Left knee; destructive inflammation in joint; amp. thigh, by A. A. Surg. J. E. Dexter. Died June 21, 1864, pyæmia.
59	Hubbach, H., Corp'l, F, 68th New York, age 42.	Aug. 30, '62, Oct. 6, '65.	Left thigh. Disch'd Nov. 20, '63. Contract'n of flex. of thigh, and atrophy; flap amp. thigh seven inches from body, by Dr. L. Bauer, of Brooklyn. Recovered.
60	Hyatt, J. B., Pt., E, 7th Indiana Cavalry, age 18.	July 9, 19, '64.	Left popliteal art. inj.; gang.; amp. thigh, by Surg. J. G. Keenon, U. S. V.; gang. of stump and left lung. Died Aug. 11, '64, pyæmia.
61	Jenkins, W. H., Pt., C, 39th Illinois.	Oct. 13, 1864. May 5, 1868.	Right thigh. Disch'd. May 18, '65, three large exostoses rem., bone scraped; Oct. 24, rem. large sequestrum; May 5, '68, thigh amp. at base of trochanter, by Surg. C. M. Clark, late 39th Ill. Recovered, Oct. 2, 1869.
62	Johnson, P., Pt., E, 2d Penn., age 27.	June 27, Oct. 19, 1864.	Right knee; sloughing; amp. thigh, by A. A. Surg. W. P. Moon. Died Oct. 21, 1864.
63	*Johnson, W.*, Pt., G, 31st Alabama, age 22.	June 15, J'y 1, '64.	Left gastrocnemius; amp. thigh. Died July 12, 1864, pyæmia.
64	Jones, J. T., Pt., H, 8th Wisconsin, age 21.	Dec. 16, '64, Feb. 26, '65.	Left leg; gang.; amp. thigh, by A. A. Surg. C. F. Barnard. Transfer'd Sept. 20, '65, for muster out.
65	Keep, M., Pt., E, 36th Massachusetts, age 23.	May 19, June 4, 1864.	Left popliteal space; knee joint ope'd by suppurat'n; amp. thigh, by Surg. D. P. Smith, U. S. V. Died June 9, 1864, pyæmia.
66	Keller, B., Pt., F, 1st Mich. Cavalry, age 36.	May 11, July 2, 1864.	Right thigh; circ. amp. of thigh, by Surgeon A. Heger, U. S. A. Died July 3, 1864, exhaustion.
67	Kenyon, B. G., Corp'l, H, 11th New Hamp.	Je. 16, '64, Jan. 3, '67.	Left leg; amp. thigh, by Prof. A. H. Crosby. Disch'd Sept. 27, '65.
68	Kintner, S. L., Corp'l, A, 24th Iowa.	July 12, —, '63.	R't thigh; amp., Surg. J. L. Dickey, 47th Ind. Died July 16, '63.
69	[2]Kegel, C., Pt., D, 15th New York H'vy Art'y, age 39.	May 30, June 6, 1864.	Right leg; gangrene; amp. thigh, by A. A. Surg. C. H. Osborne. Died June 16, 1864, pyæmia.
70	Lane, D., Pt., K, 14th Ohio, age 34.	June 14, Aug. 7, 1864.	Left knee; sloughing; amp. thigh, by Asst. Surgeon B. E. Fryer. Died Aug. 16, 1864, pyæmia.
71	Larkin, T., Pt., K, 4th Mass., age 18.	June 23, '63, June 15, '64.	Left thigh and wrist. Disc'd Aug. 20, '63. Atrophy and exc. pain; amp. at up. third thigh, by Dr. C. H. Stedman, Boston. Rec'd.
72	*Lauch, H.*, Pt., Braxton's Artillery, age 34.	Sept. 19, 28, '64.	Left thigh, severing fem. art. and vein; hæm.; amp. thigh, by Surg. G. M. Burditt, P. A. C. S. Died Sept. 28, shock oper'n and gang.
73	Lee, W. H., Corp'l, F, 32d Colored Troops, age 26.	Feb. 10, Mar. 14, 1865.	Right thigh; exten. suppu n, knee joint inv.; circ., lower third, by Surg. A. H. Thurston, U. S. V. Died March 14, 1865, irritative fever, shock.
74	Leonard, J., Pt., L, 7th New York H'vy Art'y, age 21.	May 30, July 8, 1864.	Left leg; July 3, hæm.; ligation of posterior tibial artery; amp. thigh. Died July 23, 1864.
75	Lloyd, R., Pt., B, 1st Kentucky.	Dec. 31, '62, Ap'l 4, '63.	Left thigh; amp. thigh at lower third. Disch'd Aug. 26, 1863.
76	Lyon, H. J., Serg't, H, 40th Illinois, age 24.	July 21, 28, '64.	Left popliteal space; gang.; amp. of thigh, by Surg. E. J. Buck, 18th Wis. Disch'd April 26, '65.
77	McCarthy, D., Pt., C, 2d Mass., age 22.	Aug. 9, Sept. 15, 1862.	Right popliteal space; amp. right thigh, by A. A. Surg. T. B. Townsend. Disch'd June 17, '64.
78	McClure, R., Pt., L, 15th Kansas, age 18.	Jan. 21, 24, '64.	Right leg, severing ant. tibial art. and nerve; mortification; amp. thigh, by Surg. A. C. Van Duzen, U. S. V. Disch'd Nov. 14, '64.
79	McMahon, E., Lieut., D, 80th New York, age 21.	Aug. 30, '62, Feb. 7, '63, Jul. —, 1864.	Left knee; circ., lower third, by Asst. Surg. E. J. Marsh, U. S. A. Re-amp., by Prof. W. Parker. Recovery. *Spec.* 1054.
80	Maher, L., Pt., C, 69th New York.	Sept. 17, Nov. 24, 1862.	Right knee; amp. post flap, up. third, by Surg. H. S. Hewit, U. S. V.; necrosis. Disch'd April 12, 1864. *Spec.* 754.
81	Martin, J. H., Pt., E, 100th Pennsylvania.	May 12, 12, '64.	Left leg, injuring saphenous vein; gangrene; amp. thigh at lower third. Died May 18, '64.
82	Martin, M., Pt., H, 1st Artillery, age 24.	June 24, Aug. 14, 1864.	Left knee; circ., mid. third, by Surg. E. Bentley, U. S. V. To duty Dec. 9, 1864.
83	[3]McCreary, S. C., Pt., F, 100th Pennsylvania.	Sept. 1, 14, '62.	Right leg, perforat'g ant. tib. art'y; amp. thigh. Disch'd Dec. 4, '62.
84	Mather, H. G., Pt., H, 90th Penn., age 20.	June 17, July 20, 1864.	Left leg; gang.; amp. thigh, by A. A. Surg. G. Badger. Died July 20, 1864.
85	Mathers, W. D., Pt., I, 6th Vermont, age 28.	Oct. 19, Nov. 13, 1864.	Left leg; gang. and hæm.; amp. thigh, by A. A. Surg. F. F. Murdock. Died Dec. 16, '64, pyæmia.
86	Meyer, M., Pt., L, 15th New York Artillery, age 44.	Aug. 18, Oct. 6, 1864.	Left leg; gang.; amp. thigh, by A. A. Surg. J. P. Arthur. Died Oct. 7, '64. *Spec.* 3280, A. M. M.
87	Miller, P., Pt., A, 64th Ohio, age 40.	Dec. 16, Jan. 22, 1865.	Left leg; gang.; thigh amp., by Surg. R. H. Gilbert, U. S. V. Died Feb. 9, '65, pyæmia.
88	*Moore, T.*, Pt., E, 51st Virginia, age 19.	Sept. 19, Nov. 14, 1864.	Right knee; abscess; circ., lower third, by Surg. B. M. Cromwell, C. S. A. Died Nov. 14, 1864.
89	Moss, B. F., Corp'l, B, 101st Illinois, age 43.	July 25, Nov. 11, 1864.	Left leg; gang.; amp. leg, by A. Surg. W. B. Trull, U. S. V. Nov. 9, diffused aneur. in poplit'l region; hæms.; amp. thigh, by Dr. Trull; hæms. from and ligation of fem. artery. Disch'd June 25, '65.
90	Nichols, M. S., Pt., G, 91st Ohio, age 23.	Sept. 19, Nov. 14, 1864.	Left leg; knee joint opened by ulceration; amp. thigh, by Asst. Surg. N. F. Graham, U. S. V. Died Dec. 7, '64, pyæmia.
91	Nobler, B., Pt., F, 85th Illinois, age 21.	June 30, Aug. 4, 1864.	Right leg; sloughing and hæm.; amp. thigh at lower third, by A. A. Surg. S. C. Ayres. Died Aug. 14, '64, anæmia.
92	[4]Nottingham, G. M., Pt., I, 56th Ohio.	May 1, 20, '63.	Left popliteal region secondarily involv'g popliteal artery; hæm.; amp. thigh, by A. A. Surg. L. Dyer. Died May 29, '63.
93	[5]*Page, A. C.*, Capt., D, 21st Virginia.	Sept. 16, 16, '62.	Post. tib. art. cut by ball; incip. mort.; amp. thigh, by R. T. Coleman, chief surg. Gen. Stonewall Jackson's Corps. Recovered.
94	Percel, J., Pt., —, 148th Pennsylvania.	May 3, 21, '63.	Thigh; aneurism; amp. up. third, by Surg. C. S. Wood, 66th New York. Died May 21, 1863.
95	Pittee, R., Corp'l, F, 50th New York.	Dec. 11, 11, '62.	Popliteal space, destroying popliteal vessels and nerves; hæm.; amp. thigh. Died Dec. 12, 62.
96	Ports, I. A., Pt., D, 27th Ohio.	Oct. 3, 12, '62.	Perfor. right poplit'l space; gang.; amp. thigh. Disch'd April 7, '63.
97	Price, G., Pt., C, 2d Delaware.	July 2, 2, 1863.	Left foot and leg; gang.; primary amp. thigh, by Surg. C. S. Wood, 66th N. Y. Died July —, '63.
98	Rayser, J. J., Pt., B, 14th Penn. Cav., age 40.	Oct. 19, Nov. 8, 1864.	Right knee; joint opened by inflam.; amp. post. flap, mid. third, by A. A. Surg. A. W. Emery. Died Nov. 8, 1864.

104	Root, H.V., Pt., B, 104th New York, age 26.	June 22, '64, Feb. 29, 65.	Right leg: gang.: necrosis: Oct. 29, remov. of 10 inches necrosed tibia; thigh amp. Disch'd July 21, '65. *Spec.* 3601, A. M. M.
105	*Rowe, G.*, Pt., B, 61st Georgia, age 32.	July 9, Aug. 5, 1864.	Right knee: gangrene, involving joint; thigh amp., by A.A. Surg. J. H. Coover. Died Aug. 7, '64. *Spec.* 3809, A. M. M.
106	*Royster, J. M.*, Pt., C, 47th North Carolina, age 29.	July 1, 26, '63.	Left thigh; amp. thigh, by A. A. Surg. G. M. Paullin. Died July 29, 1863. *Spec.* 3261, A. M. M.
107	[1] Schatt, H., Corp'l, H, 64th New York, age 30.	Mar. 25, April 2, 1865.	Left thigh, dividing popliteal art.; amp. thigh, by A. A. Surg. H. Craft. Disch'd Sept. 26, 1865. *Specs.* 171, 2283, A. M. M.
108	Shugert, J. L., Corp'l, B, 49th Penn., age 20.	April 1, May 20, 1865.	Right knee: second. disease joint; amp. thigh at low. third, by A. A. Surg. W. B. Chambers; hæm.; May 21, lig. femoral. Died May 25, '65, exh'n from hæmorrhage.
109	Shupe, J., Pt., E, 49th Ohio.	Dec. 15, 15, '64.	Left leg, amp. thigh. Died Jan. 1, 1865, gangrene.
110	Simpson, P., Pt., F, 36th Colored Troops, age 23.	Sept. 20, 1864.	Left thigh: amp. thigh. Died Oct. 22, '64, exhaustion.
111	Slanker, J., Pt., C, 162d Ohio N. G.	June 19, July 2, 1864.	Left thigh, injuring poplit'l art'y; gang.; amp. thigh, by A. A. Surg. W. H. Drury. Died July 2, '64, 12 hours after oper'n, from shock.
112	Sloss, A., Pt., A, 5th Penn., age 35.	Dec. 10, '64, June 10, '65.	Left knee: destruc. of tissue; amp. junct. low. thirds, by Asst. Surg. J. H. Frantz. Dis. Nov. 2, '65.
113	Smith, J. A., Pt., C, 4th Maryland, age 18.	May 14, June 9, 1864.	Right knee; second. involv. joint; amp. of thigh, by A. Surg. A. Ingram, U. S. A. Disc'd Mar. 23, '65.
114	Smith, W. F., Major, 1st Delaware.	Oct. 27, 27, '64.	R'ht thigh: lig. fem. art. and vein: amp. th., by Surg. A. N. Dougherty, U. S. V. Died Nov. 6, 1864.
115	Spalding, J. E., Pt., C, 35th New York, age 30.	Aug. 30, Sept. 12, 1862.	Left popliteal artery severed; amp'n thigh. Died same day, from hæmorrhage.
116	Spencer, C., Capt., I, 1st Michigan.	July 2, Dec. 28, 1863.	Right thigh, injur'g sciatic nerve; amp. thigh, by A. A. Surg. D. O. Farrand. Disch'd May 16, '64.
117	Stark, O. H., Serg't, H, 13th New Hampshire, age 36.	Sept. 29, '64, Jan. 3, '65.	Right leg; sloughing; Dec. 25, amp. leg; reamp. in thigh, by A. A. Surg. H. H. James; hæm.: art'y lig. Died Jan. 13, '65, pyæm.
118	Sultz, S. A., Pt., B, 1st Missouri, age 25.	Nov. 30, '64, Feb. 7, '65.	Right thigh; gang.; popliteal art. sloughed; amp. thigh, by Surg. B. B. Breed, U. S. V. Died Feb. 16, 1865, exhaustion.
119	Taylor, James, Pt., K, 7th New York Heavy Artillery, age 22.	June 16, '64, Jan. 17, '65.	Left leg; thigh amp., by A. A. Surg. E. J. Farwell. Disch'd July 6, 1865.
120	Thorn, H. C., Pt., I, 14th West Virginia, age 19.	July 20, Aug. 7, 1864.	Right thigh; Aug. 7, hæm.; lig. fem.; amp. thigh, by Surg. J. B. Lewis, U S. V. Died Aug. 12, '64.
121	Townsend, E., Pt., F, 5th New Hampshire, age 35.	June 2, 21, '64.	Left knee; joint ope. by ulcerat'n; amp. post. flap, upper third, by Surg. E. Bentley, U.S.V.; hæm.; lig'n. Died July 1, '64, asthenia.
122	Trees, J., Corporal, D, 188th Penn., age 21.	June 2, 28, '64.	Right knee. June 20, hæm.; popliteal flaps, mid. third. Disch'd Dec. 8, 1864.
123	Vann, D., Pt., B, 8th N. York Artillery, age 18.	June 3, 20, '64.	Left thigh, injuring popliteal art.: hæm.; June 16, popliteal lig.; hæm. recurred; amp. thigh, by A. A. Surg. E. Vogel. Died June 22, '64, gangrene.
124	Waller, J. R., Corp'l, A, 19th Infantry, age 17.	July 30, Oct. 25, 1864.	Right knee; gang.; thigh amp., by A. A. Surgeon M. L. Herr. Died Nov. 5, '64, pyæmia.
125	Watson, J. H., Pt., B, 10th N. Jersey, age 36.	June 4, 24, '64.	Left knee; joint ope. by suppu'n; muscular flaps, mid. third, by Surg. E. Bentley, U.S.V. Died June 28, 1864, exhaustion.
126	*White, J. L.*, Guerilla, age 38.	May —, 1863. Primary.	Both legs perforated; left post. tibial art. and nerve completely sev'd; gang.: amp. thi. Recov'd.
127	Wick, J. C., Pt., C, 155th Penn., age 22.	Mar. 25, June 14, 1865.	Both thighs: May 23, hæm from left popliteal; lig'n; amp. thigh, by A. Surg. A. Delaney, U.S.V. Died June 20, '65, exhaustion.
128	Wild, C. B., Corp'l, E, 114th New York.	Sept. 19, Oct. 12, 1864.	Right popliteal space: Oct. 1, hæm. from popliteal artery; lig.; amp. thigh, by Asst. Surg. B. A. Fordyce, 160th N. York. Died Oct. 13, 1864, exhaustion.
129	Wing, J. W., Pt., H, 27th Mass., age 45.	Mar. 14, April 7, 1862.	Right leg; gangrene; amp. thigh, by Surg. G. A. Otis, 27th Mass. Died April 17, 1862, exhaustion.
130	Wolf, J., Corp'l, D, 4th New York Cavalry.	Oct. 12, Nov. 26, 1863.	Left thigh: gang.: amp. thigh, by A. A. Surgeon J. F. Thompson. Disch'd Oct. 11, 1864.
131	Wright, D., Pt., A, 57th New York, age 23.	Sept. 17, Dec. 2, 1862.	Right thigh: gang.; amp. thigh, by A. A. Surg. A. V. Cherbonnier. Died Dec. 20, '62, gang. *Spec.* 888, A. M. M.

Amputations at the Knee.—But one of the six disarticulations at the knee for complications involving shot flesh wounds of the leg had a favorable result. Three of the operations were intermediary, three secondary:

TABLE VII.

Numerical Statement of Six Disarticulations at the Knee Joint for Complicated Shot Injuries unattended by Fracture.

NO.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	INJURY, OPERATOR, AND RESULT.
1	Cole, D. D., Corp'l, A, 2d New York Cavalry, age 23.	April 7, Aug. 1, 1865.	Left leg: gang.: amp at the knee joint, patella retained, by Ass't Surg. G. M. McGill, U. S. A. Disch'd Nov. 22, 1865.
2	Dempsey, M., Pt., I, 17th Vermont, age 18.	Oct. 5, Dec. 27, 1864.	Left leg: obliteration of fem. art., sloughing, and recurrent hæm.; amp. at knee joint, by Ass't Surgeon W. A. Harvey, U. S. V. Died March 26, 1865.
3	Grimes, F. A., Pt., C, 4th Vermont, age 22.	April 16, 22, '62.	Right leg, injuring popliteal art.: hæm.: amp. at knee joint, by Surg. R. B. Bontecou, U. S. V.: gang. Died April 28, 1862.
4	Huntington, L., Pt., B, 92d New York, age 29.	June 3, Aug. 2, 1861.	Left leg; slough g: recur't hæm.: amp. at knee joint, by Surg. R. B. Bontecou, U. S. V. Died Aug. 8, 1864, exhaustion. *Card Phot.*, Vol. III, p. 23.
5	Leonard, J., Pt., G, 5th Ohio, age 22.	July 3, 16, '63.	Right leg, injur'g post. tib. nerve; tetanus; amp. at knee joint, by Ass't Surg. H. C. May, 115th N. Y. Died July 16, '63, tetanus.
6	Taggart, S. D., Serg't, G, 150th Pennsylvania, age 25.	Feb. 6, 20, '65.	Left leg; gang.: recurrent hæm.: amp. at knee joint, by Ass't Surg. J. Vansant, U. S. A. Died February 20, 1865.

[1] LIDELL (J. A.), *op. cit.*, p. 47.

Amputations in the Leg.—Of sixty-three operations in this category thirty-three proved fatal, or 52.3 per cent Two primary cases were successful; of twenty-four intermediary operations, seventeen, or 70.8 per cent., proved fatal; of thirty-seven secondary amputations, sixteen, or 43.2 per cent., proved fatal. The Museum possesses pathological specimens from some of the cases. Two of the cases are detailed, and all are enumerated in TABLE VIII:

FIG. 22.—Six inches of shaft of the left tibia, carious and eroded. *Spec.* 858.

CASE 126.—The late Dr. Bodisco Williams, of Georgetown, D. C., who served in the Confederate Army, presented Acting Assistant Surgeon F. Schafhirt, of the Army Medical Museum, with the specimen figured below, with the accompanying history: "Rev. J. L———, a young priest from New Orleans, acting voluntarily as field chaplain, tried to persuade a company of Irish railway laborers to take up arms to fight against the Yankees in front of Fredericksburg, December 12, 1862; but during his speech a large shell exploded close in front of the group and killed three and wounded eight, including the priest, who received a small skin wound over the inner surface of the left tibia, about five inches above the tarsal articulation. Rev. L——— did not take much notice of the wound until the leg was in full inflammation up to the knee. He had returned to Lynchburg, where he applied bread and milk poultices for several weeks, but afterwards he sent for a physician, who exerted all his knowledge to save the leg. But nothing would avail, and caries of the bone having supervened, gangrene at last reminded the attendant of amputation, which was performed by Dr. Pearson, of Virginia, who took the leg off one inch below the tuberosity of the tibia, August 25, 1863. But even this remedy did not improve the physical health of the patient; and his soul left Lynchburg, September 2, 1863, for that great and blissful haven, it may be hoped, which he had promised to those Irishmen in front of Fredericksburg." The specimen represented in the adjacent wood-cut (FIG. 22) presents great erosion, as though from caustic applications made to arrest the progress of gangrene, and there are neighboring evidences of extensive periosteal thickening with osseous exudations and deposits. See *Cat. Surg. Sect., Army Medical Museum*, 1865, p. 394.

CASE 127.—Private G. Brown, Co. C, 97th Pennsylvania, aged 18 years, was wounded at Petersburg, June 17, 1864, and was admitted to hospital at Fort Monroe two days afterwards. Assistant Surgeon E. McClellan, U. S. A., reported: "Gunshot wound of right foot, flesh." From Fort Monroe the wounded man was transferred to Knight Hospital, New Haven, where amputation was performed but not recorded. Subsequently the patient was transferred to McDougall Hospital, and lastly, on January 19, 1865, to Central Park, New York City, whence Surgeon B. A. Clements, U. S. A., reported; "Gunshot wound of right foot; a minié ball passed through the metatarsus, entering on the dorsum of the foot. Mortification supervened and the condition of the injured parts became very bad; constitutional condition of patient feeble; loss of appetite; unable to sleep from pain in wound. On July 11th, amputation (apparently circular) of the leg just above the ankle joint was performed at the Knight Hospital, New Haven, by Acting Assistant Surgeon C. Lindsley. Two ligatures were applied, and ether was used as the anæsthetic. Healing progressed well for three weeks, when the stump sloughed, which was arrested in four or five days." The specimen represented in the annexed wood-cut (FIG. 23) was contributed by Acting Assistant Surgeon S. Teats, who performed re-amputation on April 16, 1865, on account of "a sloughing ulcer and a cold and blue condition of the stump." The stump healed at the end of five weeks after the last operation, and the patient was supplied with an artificial leg about two months afterwards. He was discharged from service August 17, 1865, and pensioned. In his application for commutation, dated 1875, the pensioner described the stump as being in good condition. He was paid his pension June 4, 1876.

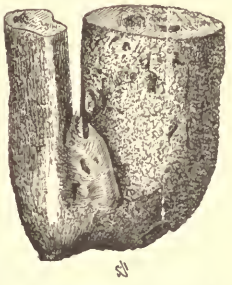

FIG. 23.—Two and a half inches of stump of right leg. *Spec.* 4329.

TABLE VIII.

Summary of Sixty-three Cases of Amputations of the Leg for Complicated Shot Injuries unattended by Fracture.

No.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	INJURY, OPERATOR, AND RESULT.	No.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	INJURY, OPERATOR, AND RESULT.
1	Addington, J., Serg't, A, 84th Indiana, age 25.	June 20, July 20, 1864.	Right ankle; gangrene; amputation leg, by Surg. R. M. S. Jackson, U. S. V. Died Sept. 2, 1864, pyæmia.	6	Batherie, N. T., Corp'l, A, 15th Mass., age 34.	June 6, 24, '64.	Left leg; gang.; amp. leg, by A. A. Surgeon M. F. Price; hæm. Died June 30, '64, asthenia from wound, and diarrhœa.
2	Ainsworth, W. H., Serg't, K, 42d New York, age 22.	May 6, June 20, 1864.	Right leg; amp. leg, by Surg. W. D. Stewart, U. S. V. Disch'd Nov. 3, 1865.	7	Becker, H., Pt., F, 50th Penn., age 23.	May 9, Aug. 10, 1864.	Right leg; sloughing; amp. leg, by A. A. Surgeon G. E. Galen. Disch'd May 22, 1865.
3	Alexander, E. J., Corp'l, B, 110th New York.	June 14, —, '63.	Right leg; amp. of leg. Died July 2, 1863.	8	Bell, J., Corp'l, G, 62th Penn., age 40.	Dec. 13, '62, Mar. 19, '63.	Left leg; sloughing; hæm.; amp leg, by A. A. Surg. F. H. Getchell. Disch'd Dec. 14, 1863.
4	Barnum, C. F., Pt., E, 187th Penn., age 30.	June 18, Aug. 27, 1861.	Left leg: amp. leg, by A. A. Surg. J. P. Arthur; hæm.; Sept. 7, amp. thigh. Died Oct. 13, 1864. *Spec.* 3132, A. M. M.	9	Bickley, H., Serg't, E, 10th New Jersey, age 21.	May 14, Aug. 13, 1864	Left: slough; amp. leg, by A. A. Surg. G. W. Webb; hæm. Died Aug. 23, '64. *Spec.* 3665, A. M. M.
5	Barron, C., Pt., D, 14th Connecticut, age 45.	May 12, Sept. 10, 1864.	Left foot; gang.; amp. leg, by A. A. Surgeon S. Smith. Disch'd June 18, 1865.	10	Bloomer, A. S., Pt., G, 55th Ohio, age 20.	May 15, July 21, 1864.	Right foot; gang.; amp. leg, by Ass't Surg. J. A. Freeman, U. S. V. Disch'd Feb. 10, 1865.

No.	Name, Military Description, and Age.	Dates.	Injury, Operator, and Result.
11	Brown, G., Pt., C, 97th Penn., age 18.	June 17, July 11, '61, Ap'l 16, '65.	Right foot; gang.; amp. just above ankle, by A. A Surg. Lindsley; sloughing; reamp. leg. Disch'd Aug. 18, '65. *Spec.* 4329, A.M.M.
12	Burke, M., Serg't, C, 155th N. York, age 51.	June 3, Aug. 26, 1864.	Right leg; sloughing; amp. leg, by A. A. Surgeon M. Lampen. Died Aug. 27, 1864, pyæmia.
13	Burley, M. D., Pt., G, 45th Penn., age 17.	May 6, Sept. 13, 1864.	Right leg; amp. leg, by A. A. Surg. B. Wilson, gang.; hæm. Disch'd Jan. 22, 1865.
14	Burns, T., Pt., D, 8th N. York H. Art'ry, age 34.	June 17, 17, '64.	Right leg; amp. leg. Discharged June 20, 1865.
15	Case, E. F., Pt., G, 13th Michigan.	Sept. 19, 24, '63.	Left thigh, seve'g fem. art.; gang.; amp below knee; gang. extending; Sept. 25, amp. at up. third thigh. Died Sept. 27, '63, gang.
16	Cousins, J. A., Corp'l, I, 1st Maine H'vy Art., age 24.	May 19, June 16, 1864.	Left foot; sloughing and erysipelous; flap amp. at up. third, by Dr. McConnor. Disch'd July 10, 1865.
17	Cross, G. P., Pt., F, 1st Mass. Heavy Artillery, age 19.	June 16, Aug. 18, 1864.	Right leg; gang.; hæm.; amp. leg, by Surg. E. Bentley, U. S. V.; two ounces of blood injected into veins. Disch'd June 9, '65.
18	*Dixon, J. H.*, Pt., F, 24th N. Carolina, age 24.	Mar. 25, April 12, 1865.	Right leg; gang.; amp. leg, by A. A. Surg. J. P. Arthur. Died May 4, 1865, exhaustion.
19	Downey, J., Pt., F, 29th Penn., age 30.	May 15, July 13, 1864.	Left leg; caries; amp. leg, by Ass't Surg. H. T. Legler, U.S.V. Disch'd Sept 1, 1864.
20	Emery, R., Pt., D, 5th Vermont, age 33.	M'y 5, '64. Aug. 23, 1865.	Left leg; gang.; hæm.; Aug. 4, 1864, post. tibial lig'n. Disch'd Dec. 16, '64; leg amp.
21	Gilbert, G. H., Lieut., B, 122d New York.	Nov. 8, Dec. 7, 1863.	Both feet contused by spent ball; gang. left foot; amp. left leg, by Surg. H. W. Ducachet, U. S. V. Disch'd May 23, 1864.
22	Gooch, A. B., Pt., F, 12th Ohio, age 21.	May 9, Nov. 19, 1864.	Left ankle; caries inv. ank. joint; flap amp. mid. third, by Surg. N. Gay, U. S. V. Disch'd Feb. 13, 1865.
23	Goodell, E. D., Corp'l, D, 25th Massachusetts, age 21.	June 3, July 22, 1864.	Right foot; gangrene; amp. leg, by A. A. Surg. B. F. Butcher. Disch'd Oct. 31, '65. *Spec.* 3332, A. M. M.
24	Goodrich, J., Pt., G, 148th N. York, age 40.	May 9, June 5, 1864.	Both ankles; gang.; amp. right leg, by Ass't Surg. H. C. Roberts, U. S. V. Died June 5, '64, exh'n.
25	Green, J. A., Serg't, E, 2d Connecticut Art'ry, age 25.	June 7, 28, '64.	Left foot; circ. amp. up. third leg, by A. A. Surg. P. Wilson. Died July 7, 1864, pyæmia.
26	Gutting, A., Pt., D, 11th Mich. Cavalry, age 26.	Oct. 2, Nov. 9, 1864.	Right leg; amp. leg, by Surg. J. B. Murphy, U. S. A. Disch'd Sept. 14, 1865.
27	Hagey, J. D., Pt., I, 138th Penn., age 24.	April 2, May 19, 1865.	Left leg; artery opened; hæm. from post. tibial artery; art. tied; amp. leg, by A. A. Surg. H. A. Drane. Disch'd July 26, '65.
28	Harris, J. M., Corp'l, C, 14th Iowa, age 20.	July 15, 27, '64	Right thigh: aneurism; sphaeclus: au'mal sac probed; exces. hæm; fem. tied; amp. leg, by A. A. Surg. R. W. Coale. Died Aug. 3, 1864, pyæmia.
29	Hays, A., Corp'l, F, 3d Delaware, age 29.	June 18, Aug. 10, 1864.	Right foot; slough'g ulcer; amp. leg, by A. A. Surgeon W. W. Sharpley. Disch'd May 18, '65. *Spec.* 3668, A. M. M.
30	James, A., Pt., I, 2d Tennessee Cavalry, age 20.	Dec. 17, '64, Feb. 4, '65.	Left ankle; ball removed; gang.; circ. amp. lower third leg, by Ass't Surg. W. B. Trull, U. S. V. Died May 16, 1865.
31	Kane, H., Pt., A, 24th Iowa, age 25.	Sept. 19, Dec. 30, 1864.	Left leg; gangrene; amp. leg, by A. A. Surg. J. W. H. Baker. Discharged May 29, 1865.
32	[1]Knoble, H., Pt., D, 149th New York, age 27.	Nov. 27, Dec. 14, 1863.	Both thighs, ball impinging on sheath of left fem. artery; gang.; amp. left thigh. Died Jan. 14, '64, pyæmia. *Spec.* 2114, A.M.M.
33	Kuentzler, J., Pt., H, 56th Penn., age 24.	June 18, July 23, 1864.	Right leg; sloughing; amp. leg, by A. A. Surg. E. K. Tell. Died Aug. 6, 1864, pyæmia.
34	Leasure, J., Pt., F, 62d Penn., age 23.	May 12, June 2, 1864.	Left leg; hæm.; amp. leg, by A. A. Surg. John Priestley. Died June 15, '64, hæm. and pyæmia.
35	*L—— J——*, Chaplain (field).	Dec. 11, '62, Aug. 25, '63.	Left leg; gang.; amp. leg, by Dr. Pearson. Died Sept. 2, 1863. *Spec.* 858, A. M. M.
36	McCurley, H., Pt., D, 1st Maine, age 18.	June 21, July 23, 1864.	Right ankle; gang.; circ. amp. mid. third, by A. A. Surg. G. E. Brickett. Died Aug. 28, 1864, pyæmia.
37	Maguire, E., Pt., I, 8th Conn., age 26.	Sept. 29, 1864. Mar. 22, 1865.	Right leg; gang.; ulceration of ante. tibial art.; amp. leg, by A. A. Surg. W. B. Casey. Disch'd Nov. 28, 1865.
38	Mangan, J., Pt., F, 82d Ohio, age 28.	July 20, 22, '64.	Left leg; amp. leg, by Surg. H. K. Spooner, 61st Ohio; hæm.; lig. of anterior tibial artery Aug. 15, '64. Disch'd May 23, '65.
39	Mendenhall, J., Pt., B, 97th Penn., age 30.	May 20, July 22, 1864.	Right leg; sloughing; amp. leg, by A. A. Surgeon A. D. Hall. Died July 29, 1864, pyæmia.
40	Moser, C., Pt., K, 5th Michigan, age 43.	June 18, July 19, 1864.	Left ankle and thigh; gang.; amp. leg, by A.A. Surg. F. D Weisse. Died July 26, 1864, pyæmia.
41	Moss, B. F., Corp'l, B, 101st Illinois, age 43.	July 25, Aug. 24, 1864.	Left leg; gang.; amp. leg, by A. Surg. W. B. Trull, U. S.V.; diffused aneurism; hæm.; Nov. 11, amp. thigh; hæm.; Dec. 15, lig. fem. Disch'd June 25, 1865.
42	Mott, J., Pt., E, 105th Illinois, age 37.	June 26, July 26, 1864.	Left leg; slough. ant. tibial; hæm.; amp. leg, by Ass't Surg. B. E. Fryer, U. S. A.; July 27, transfusion. Died Aug. 5, '64, hæm.
43	Paden, W., Corp'l, G, 16th Penn. Reserves, age 22.	May 23, June —, 1864.	Right thigh; May 29, 31, hæm.; June 1, femoral tied; amp. leg, by Surg. G. L. Pancoast, U.S V. Died June 26, 1864, gangrene.
44	Parmenter, J. D., Pt., G, 67th Penn., age 16.	April 6, June 21, 1865.	Left foot; gangrene and necrosis; amp. leg, by Surg. R. B. Bonteeou, U.S.V. Disch'd Nov. 23, '65.
45	Prather, B., Corp'l, D, 103d Ohio, age 18.	Dec. 15, 27, '64.	Right foot; exc'n half in. post. tib. nerve; Dec. 26, amp. great toe; amp. leg, by A. A. Surg. S. G. Ayres. Died Dec. 29, '64, tetanus.
46	Reed, J., Corp'l, F, 101st New York.	June, '62. Intermediary.	Shot flesh w'nd of ank. joint; circ. amp. at junct. of low. third leg, by Ass't Surg. P. S. Connor, U. S. A. Died July 29, 1862.
47	*Ross, A. G.*, Corp'l, I, 13th Mississippi, age 21.	Oct. 19, Nov. 8, 1864.	Right fem. art. injured; also w'd of left thigh; gang.; lig. of fem.; amp. right leg three ins. above ankle. Retired March 14, 1865.
48	Saulsbury, W., Pt., K, 39th Colored Troops, age 36.	July 30, 1864. Jan. 19, 1865.	Right leg; sloughing; hæm. ant. tibial art.; art. lig. in w'nd; hæm. recur'd; art. relig.; amp. leg, by A.A. Surg. O. Shittler. Disch'd May 26, '65. Died July 16, '71.
49	Smith, W., Pt., D, 17th Infantry, age 22.	May 12, July 8, 1864.	Right ankle joint; suppurative inflam'n, caries; amp. leg, by A. Surg A. Ingram, U. S.A. Died July 20, '64. *Spec.* 2865, A. M. M.
50	Stark, O. H., Serg't, H, 15th New Hampshire, age 36.	Sept. 29, Dec. 25, 1864.	Right; slough.; amp. leg, by A.A. Surg. H. H. James; sloug'g; Jan. 3, 1865, amp. thigh; hæm.; lig. Died Jan. 13, '65, pyæmia.
51	Stebbins, E., Serg't, L, 3d New York Cavalry, age 26.	Sept. 6, Oct. 12, 1862.	Left leg; hæm.; amp. leg. Discharged June 15, 1863.
52	Stultz, G., Serg't, K, 5th New Jersey, age 26.	June 16, '64, Jan. 9, '65.	Left leg; gang. and necrosis; amp. leg, by Surg. E. Bentley, U.S.V. Left hospital April 18, 1865.
53	Sullivan, D., Pt., F, 1st Penn. Rifles, age 23.	Dec. 13, 29, '62.	Left foot; extensive inflammat'n; amp. leg, by A. A. Surg. C. H. Bowen. Discharged.
54	Tawney, A., Pt., D, 74th Indiana, age 38.	Sept. 19, Nov. 29, 1863.	Left leg; hæm.; amp. leg, by Surg. G. Grant, U. S. V.; gang. Died Dec. 6, 1863, gangrene.
55	Tewksbury, D., Pt., F, 73d Ohio, age 22.	July 2, '63, Ap'l 8, '64.	Left leg.; gang.; amp. leg, by Surg. A. M. Speer, U.S.V. Died May 8, 1864, pyæmia.
56	Thompson, J. A., Corp'l, K, 10th Indiana, age 27.	Aug. 3, Sept. 3, 1864.	Left leg; gang.; amp. leg, by A. A. Surg. A. L. Rice; hæm. from popliteal artery; artery tied. Died Oct. 4, 1864.
57	Thornton, R. M., Serg't, K, 4th Rhode Island, age 26.	July 30, Sept. 28, 1864.	Left leg; hæm.; amp. leg, by A. Surgeon S. A. Orton, U. S. A. Disch'd January 28, 1865.
58	Tillotson, C. A., Pt., E, 39th Iowa, age 32.	Oct. 5, Dec. 25, 1864.	Right ankle; slough'g and hæm.; ant. post. flap amp. at mid. third, by Ass't Surg. B. E. Fryer, U. S. A. Died Jan. 6, '65, pyæmia.
59	Tryan, N., Pt., E, 4th Ohio, age 26.	May 5, July 3, 1864.	Left foot; gang.; amp. leg, by A. A. Surg. A. McLetchie. Died Aug. 10, 1864, asthenia.
60	Wares, D., Corp'l, 22d Massachusetts, age 31.	May 5, 20, '64.	Right leg; amp. leg, by Surg. D. W. Bliss, U. S. V. Discharged October 25, 1864.
61	Williams, G., Pt., H, 29th Colored Troops, age 37.	Sept. 27, Oct. 22, 1864.	Left leg; hæm.; amp. leg, by A. A. Surgeon J. H. Buchanan. Died Oct. 25, '64, exhaustion.
62	Wolf, C., Corp'l, D, 5th Minnesota, age 31.	Dec. 16, '64, Jan. 5, '65.	Left leg, also wound of right leg; amp. left leg, by A. A. Surg. L. E. Tracy. Died Jan. 19, 1865, gangrene.
63	Wright, E., Pt., F, 119th Penn., age 18.	May 5, 25, '64.	Right leg, cutting post. tibial art.; gang.; hæm.; May 22, lig.; hæm. recur'd; amp. leg, by Surg. E. Bentley, U. S. V. Died May 28, 1864, asthenia and pyæmia.

[1] LIDELL (J. A.), *Wounds of the Arteries*, in *Surg. Mem. of the War of the Rebellion, coll. and pub. by the U. S. San. Comm.*, 1870, Vol. I, pp. 27, 551.

Amputations of the Toes.—There was a single example of amputation of the great and second toes for gangrene following ligation of the femoral artery for a shot wound of the thigh. (CASE 55 of TABLE III, p. 48.)

CASE 128.—Private J. L. Hunt, Co. G, 57th New York, aged 42 years, was wounded at the Wilderness, May 5, 1864. Assistant Surgeon J. C. McKee, U. S. A., reported his admission to Lincoln Hospital, Washington, May 26th, with "gunshot wound of left thigh." Two weeks afterwards the patient was transferred to Camden Street Hospital, Baltimore, and on October 23d he entered Mower Hospital, Philadelphia, where Acting Assistant Surgeon F. W. Saunders recorded the following: "A minié ball entered the thigh at the inner side, upper third, and, passing backward and outward behind the femur, emerged just below the tuberosity of the ischium. Deficient circulation from ligature or otherwise of the great trunks occasioned mortification in the foot, rendering necessary the amputation, previous to admission, on September 5th, of the first and second toes at the second joints." The patient was subsequently transferred to McDougall Hospital, New York Harbor, whence he was discharged June 5, 1865, Assistant Surgeon S. H. Orton, U. S. A., certifying, "the wound has been gangrenous; extensive cicatrix remaining, causing great contraction of muscles; little use of leg." On June 1, 1866, the pensioner was supplied with a supporting and extensor apparatus by Dr. E. D. Hudson, of New York, who in his statement reports the ligation as having been performed on "July 9." The New York City Examining Board certified, December 8, 1875: "There is a cicatrix five inches by four on inner side of left thigh, middle third, which is adherent and radiated. The femoral artery has been cut and tied. There is great loss of muscular substance. The great and second toes have sloughed away; foot poorly nourished. Has to wear an artificial appliance to enable him to walk. There is considerable atrophy of muscles of the limb. The disability is equal to the loss of the limb." The pensioner was paid March 4, 1876.

Tenotomy.—There were five examples of tenotomy for the relief of deformities resulting from shot wounds of the lower extremities. The case of Sergeant Louis Morell (CASE 243, *Med. and Surg. Hist. of the War*, Part II, Vol. II, Chap. VI, p. 80, and PLATE V, Fig. I) has been detailed. In the case of Private H. B. Franklin, Co. E, 52d Indiana, aged 21, Surgeon A. Hammer, U. S. V., divided the tendo Achillis at the Marine Hospital, St. Louis, November 5, 1864, and relieved talipes of several months' standing. He was returned to duty January 24, 1865.

CASE 129.—Private J. H. Armidon, Co. I, 49th New York, aged 19 years, was admitted to Satterlee Hospital, Philadelphia, June 21, 1863. Acting Assistant Surgeon M. J. Perry reported: "The patient was received from hospital at Washington, suffering from diarrhœa. He had previously received a gunshot wound of the leg at the battle of Antietam. Leg bent almost on to thigh. The hamstring tendons were cut by Acting Assistant Surgeon T. G. Morton, formerly in charge of the ward. October 30th, leg much straighter; is obliged to walk with crutches. November 20th, is able to walk about with a cane; leg still a little bent. December 13th, wound nearly healed; general health good. January 1, 1864, patient returned to duty, cured." Several weeks afterwards the man entered Augur Hospital, whence he was discharged for disability, February 10, 1864, Surgeon S. B. Hunt, U. S. V., certifying to "Shell wound of popliteal space of right leg, received at Chancellorsville, May 3, 1863, causing permanent lameness; still discharging." The Washington hospital records show that Armidon was "admitted to Lincoln Hospital on February 27, 1863, with intermittent fever," and that he "deserted June 20, 1863," but no note was made of the wound. He is not a pensioner.

CASE 130.—Private T. Caswell, Co. C, 6th New Hampshire, aged 30 years, was wounded in the right leg, at Bull Run, August 29, 1862. He was admitted to the Georgetown College Hospital, subsequently transferred to Satterlee, Philadelphia, and lastly to Lovell, Portsmouth Grove. Assistant Surgeon W. F. Cormick, U. S. A., in charge of the latter, reported: "Wound healed with severe contraction of the tendo-achilles, resulting from extensive and repeated sloughing. On October 5, 1863, tenotomy was performed, by dividing the tendo-achilles, by Acting Assistant Surgeon J. W. Cushing. The wound caused by the operation healed by November 25th, and the splints, etc., were removed, the foot and ankle resuming their former positions and functions. On December 15th the patient was able to walk without crutch or cane. He was discharged from service December 30, 1863." Examiner W. G. Perry, of Exeter, N. H., February 17, 1864, certified: "Ball entered the outside about midway between the knee and ankle joints, passing directly across the leg. * * There is contraction of the tendo-achilles, which has been partially relieved by division, but he cannot bring his heel entirely down. Standing causes pain." In October, 1869, he reported that contraction in the use of the leg had produced irritation of the eschar, resulting in ulceration. Examiner E. B. Hammond stated, September 11, 1875: "The foot is reduced in size, the leg is weak, etc." The pensioner was paid June 4, 1876.

The fifth case in which tenotomy was practised has been already noted as 27 of TABLE VI, on page 54, amputation being resorted to twelve years after the reception of the injury on account of the uselessness of the limb.

CASE 131.—Private T. Cooper, Co. C, 4th Pennsylvania Reserves, aged 18 years, was wounded near White Sulphur Springs, June 22, 1864. He was admitted to the Post Hospital at Beverly, and, on August 8th, transferred to the Grafton Hospital. Surgeon S. N. Sherman reported: "Gunshot wound of left thigh; ball entered two inches above knee, on outer side, exit near tuberosity of the ischium; also flesh wound of middle of leg. December 31st, leg flexed at nearly right angle to the thigh, caused principally by contraction of the semimembranosus and semitendinosus; motion of knee joint perfect; consid-

erable talipes varus, though without anchylosis. Subcutaneous division of the hamstring tendons performed by Surgeon S. N. Sherman, U. S. V.; chloroform used. Patient reacted promptly, being in good health, though of rather delicate constitution. After division of the tendons the leg was forcibly extended and secured to a straight splint, extending from nates to heel. Twenty-four hours after operation patient rested quite easy and entirely free from pain." The patient was furloughed on April 11, 1865, and admitted to the Emory Hospital, Washington, several weeks afterwards. On June 23, 1865, he was discharged by reason of "paralysis and deformity of the left leg caused by the wound," and pensioned. The man subsequently removed to Birmingham, England, where, in December, 1870, he was seen by Mr. J. B. Gould, the U. S. Consul, who described his condition as follows: "His left leg and foot are withered, the foot icy cold and curled up like a bird's claw, and the leg withered and dead to the hip joint," etc. About this time the pensioner was also examined by Surgeon Jos. Morris, M. R. C. S., who certified: "I find him suffering from the effects of a gunshot wound of the left thigh. The sciatic nerve has been injured, and the entire limb rendered permanently and entirely useless. He suffers great pain in the injured limb," etc. This certificate was corroborated by Surgeon Jordan, F. R. C. S., and Professor of Surgery at Queen's College, at a subsequent examination on March 4, 1871. Surgeon Oliver Pemberton, F. R. C. S., in charge of the General Hospital at Birmingham, certified, on June 6, 1876: "On the third day of May, 1876, I amputated the left leg of Thomas Cooper above the knee, the said limb having become useless on account of a gunshot wound," etc. The pensioner was paid June 4, 1876.

A case of shot injury of the foot in a distinguished general officer may conclude the illustrations selected for this section:

CASE 132.—Major-General J. Hooker, U. S. V., was wounded at the battle of Antietam, September 17, 1862. The injury was reported by Assistant Surgeon B. Howard, U. S. A., as follows: "He was wounded in the right foot by a minié ball while leading his command, being on horseback at the time, and standing in the stirrups with his weight thrown on his right foot, which was turned outward. The ball struck the inner side of the foot inferiorly to the middle of the scaphoid bone, passing between the first and second layers of the plantar muscles, almost transversely across the plantar portion of the foot, and emerging inferiorly to the anterior border of the cuboid bone. The bones of the foot were uninjured. On the morning of September 18th, I was sent by the Medical Director of the Army of the Potomac to attend General Hooker, * * then lying in a farm-house near the battle-field. Warm-water dressings had been applied previous to my visit. There was no constitutional disturbance, but the foot was hot and inflamed. By means of a syringe I thoroughly washed out the wound with warm water, and finding it most agreeable to the patient, substituted cold- for warm-water dressings. The next day I found the patient very comfortable; the appearance of the foot had greatly improved and the inflammatory symptoms had disappeared. I then ordered a lotion of plumbi instead of cold-water dressings as being more likely to allay any irritation that might arise in the parts. Before the General left that evening, for Washington, I advised him to resume the use of tepid water as soon as all tendency to active inflammation should cease. On October 25th, I heard that tetanic symptoms had manifested themselves, but received a letter from the General a few days afterwards stating to the contrary. On November 25th the General, who had returned to duty in the field, requested me to look at his wound, which still troubled him somewhat. I found the newly formed cicatrices somewhat tumefied; they were painful on pressure, and the General was still unable to mount his horse unaided, though he persisted in being on active duty. On November 30th, I found there had been a steady improvement, and, although the step had not its former elasticity, the wound had left no serious inconvenience behind." General Hooker remained in active service until the close of the war, and was ultimately retired October 15, 1868.

Wounds of the soft parts of the lower extremities, though constituting the largest group of injuries received in action, have seldom been much commented on by authors.[1]

[1] In addition to the bibliographical references cited in previous pages of this section the following may be consulted with interest: PARE (A.) (*Œuvres complètes*, éd. MALGAIGNE, Paris, 1840, T. II, Chap. XXXVII, p. 110) remarks: "Les plaies faites au dedans des Cuisses sont souvent cause de mort subite, quand elles penetrent en la grosse veine Saphene, ou grosse artere, et aux nerfs qui les accompagnent: ce que j'ay veu souvent advenir" . . and "Mais quand elles penetrent profondément, souvent advient grands accidens, comme inflammation, aposteme, et pourriture aux membranes qui couvrent les muscles, qui causent que l'ulcere jette une tres-grande quantité de matiere, de façon que le malade meurt en atrophie, et tout desseiché." . . . RAVATON (*Chir. d'armée, ou Traité des plaies d'armes a feu*, Paris, 1768, p. 321 *et seq.*) dwells on the importance of flesh wounds of the lower extremities, and cites many and exceedingly interesting examples of extensive lacerations, lodgement of missiles and other foreign substances. He details six cases of shot flesh wounds of the thigh (*Obs.* 81, 83, 84, 85, 86, 87), an instance (*Obs.* 90) of shot wound of the knee, the missile opening the joint without lesion (sans toucher) of bone, and four cases of shot flesh wounds in the leg (*Obs.* 91, 93, 94, 95), one of which (*Obs.* 94) was followed by amputation of the leg. . . . LE DRAN (H. F.) (*Obs. de Chir.*, Paris, 1731, T. I, p. 347) records a case of shot flesh wound of the thigh followed by repeated hæmorrhages. . . . WILLIAMSON (G.) (*Military Surgery*, London, 1863, p. 133), in a subsection on *Simple Flesh Contusions and Wounds of the Lower Extremities*, records 130 cases of this kind from the mutiny in India, 1857–58; 117 were slight, 13 severe. Of the 130 cases, 90 were returned to duty, 15 to modified duty, and 25 were invalided. . . . THOMPSON (JOHN) (*Report of Obs., etc., after the Battle of Waterloo*, Edinburg, 1816, p. 125) refers to several cases of extensive lacerations of the soft parts by large missiles. . . . NEALE (JOHN) (*Chirurgical Institute*, London, 1805, p. 247 *et seq.*). . . . GORDON (C. A.) (*Lessons on Hygiene and Surgery*, London, 1873, pp. 152, 153) cites several examples of flesh wounds of the thigh, and on page 157 gives three cases of recovery after periarticular wounds of the knee joint. . . . KLEBS (E.) (*Beiträge zur Path. Anatomie der Schusswunden*, Leipzig, 1872, pp. 42, 58) cites six obductions in cases of shot flesh wounds of the lower extremities—3 of the thigh and 3 of the leg. . . . CHENU (J. C.) (*Aperçu hist. stat. et clin. pendant la guerre de* 1870–71, Paris, 1874, T. I, p. 278) very briefly adverts to two cases of flesh wounds of the thigh, one of the leg and a penetrating flesh wound of the knee joint, followed by traumatic arthritis. . . . FISCHER (H.) (*Kriegschir. Erf.*, 1872, p. 164) says: "The wounds of the soft parts of the leg, as a rule, progressed very favorably. . . Much worse proved the wounds of the soft parts of the foot. Nearly always circumscribed or diffuse phlegmonous abscesses developed necessitating repeated incisions. . . . MACCORMAC (W.) (*Notes and Recollections of an Ambulance Surgeon*, London, 1871, p. 129) tabulates 63 cases of wounds of the soft parts of the thigh without fracture, with 6 deaths, and 36 cases of wounds of the soft parts of the leg, with 1 death. . . . LÜCKE (ALBERT) (*Kriegschir. Fragen und Bemerk.*, Bern, 1871, pp. 6–9) details six cases of shot flesh wounds of the lower extremities complicated by secondary bleeding, among them three cases of ligation of the crural artery, and remarks: "In recent injuries we yet ligate now and then successfully the crural artery, but we will more and more come to the conclusion rather to tie the external iliac than the crural artery." . . . SCHÜLLER (M.) *Kriegschir. Skizzen*, Hannover, 1871, p. 18) tabulates 136 cases of shot flesh wounds of the lower extremities. All recovered. . . . SCHINZINGER (A.) (*Das Reserve-Lazareth Schwetzingen*, Freiburg i. Br., 1873, p. 68) notes the gravity of shot wounds of the soft parts of the thigh after the battle of Weissenburg.

SECTION II.

WOUNDS AND INJURIES OF THE HIP JOINT.

In the important class of injuries of the joints, those of the hip joint are preëminently hazardous to life, obscure in diagnosis, and difficult in treatment. In the Surgical History of the War of the Rebellion, a comprehensive and systematic classification of this group of wounds and injuries should include the contusions and sprains and dislocations and simple fractures at the articulation, shot wounds involving the tendinous and ligamentous structures about the joint, or laying open the capsule, and shot fractures implicating the acetabulum or head, neck, and trochanters of the femur, examples of secondary coxitis from extension of inflammation, or septic infection from injuries of the upper part of the shaft, and lastly, cases in which operative interference at the hip is imperative from the extension of lesions of the upper part of the shaft to the articulation. Yet, in this Section, it is proposed to treat mainly of shot fractures involving the hip joint,[1] and of operations at the hip following shot injuries, except in a single instance.[2] There appear on the records notes of about thirty-five examples of luxations at the hip, fifteen simple fractures believed to implicate the hip joint, and forty-four cases returned as contusions or sprains at the hip; but these cases will be referred to in subsequent chapters of this volume, as more in accordance with the classification heretofore adopted. Examples of coxitis from periarticular wounds, in which the primary lesions were believed to be confined to the membranous or ligamentous or other adjacent soft tissues, were discussed in the last Section, and of instances of secondary coxitis from extension of lesions of the shaft we shall find many in the following Section on shot fractures of the shaft of the femur.

In the preceding Section (pp. 26, 28) all pains has been taken to collect the observations that were recorded of periarticular shot wounds at the hip, and details are referred to of all the facts that could be collected of forty-nine cases that were reported. Professor H. H. Smith[3] and other systematic authors believe that shot wounds of the hip joint, unattended by injury of the bone, are very rare; but there seems to be a growing conviction among military surgeons that, owing to the extreme difficulties of diagnosis, many such cases may escape observation, or be misinterpreted until late in their progress. The early recognition of the precise extent of wounds of the hip joint is of the utmost practical

[1] JOHN HENNEN, in his classical treatise, remarks: "The injuries occasioned by balls lodging near or about the joint of the hip are among the most serious of military surgery. The fever, the profuse discharges, the tedious exfoliations, all tend to sink the patient, and are but too often fatal. In some of these cases the course of the ball is so obscure, and its place of lodgement so uncertain, that it can only be detected after death. I have seen balls lodged in almost every part of the trochanters, neck, and head of the bone, and yet the most accurate examination during life did not lead to a discovery of their situation."—*Principles of Military Surgery*, 2d ed., Edinburgh, 1820, p. 155.

[2] Among the coxo-femoral disarticulations one example will be cited where the operation was a re-amputation following an amputation in the continuity of the thigh for a bayonet stab in the knee joint, the only case to be adverted to not connected with shot wounds.

[3] Professor H. H. SMITH (*Princ. and Pract. of Surgery*, 1863, Vol. I, p. 526) remarks that "wounds of the hip joint, uncomplicated by injuries of the bone, are seldom seen. The joint lies quite deep, and is protected by the shelving outward of the ilium and by the prominence of the great trochanter. An injury reaching it is almost necessarily associated with some fracture of the bones."

importance, and demands a careful and prompt examination to determine whether conservative measures are admissible or if operative interference is advisable. Yet here the greatest obstacles present themselves. It must still be admitted, and cannot be too much impressed on the minds of surgeons, that far greater attention and care and trouble are requisite in these than in the injuries of other joints. Until comparatively recent years shot injuries of the hip were regarded as almost inevitably hopeless, and military surgeons enquired into them but little;[1] but now it is agreed that recoveries may be obtained in this group of cases, either under conservative measures or by operative interference, and the

[1] In the section on the surgical literature of shot wounds of the hip joint with which Professor B. von LANGENBECK prefaces his essay *Ueber die Schussverletzungen des Hüftgelenks*, read before the second session of the German Surgical Congress, April 19, 1873, and printed in the *Archiv*, B. XVI, S. 264, the learned professor observes that in ancient military surgical literature we find wounds of this joint seldom mentioned. This is emphatically true. Not only in SCHENCKIUS, of Græffenburg, who laboriously summarized the labors of his predecessors in chronicling rare cases, in PLATER, in FABRICIUS HILDANUS, in the monumental BONETUS, and in other collectors of curious pathological observations, one searches in vain for instances of wounds of the hip; but we scan the writings of the early teachers who treated specially of shot injuries with as little success. MAGGIUS, FERRIUS, ROTA, and the excellent BOTALLUS, VIGO, FELIX WURTZ, HIERONYMUS of Braunsweig, GERSDORF, and even the so-called father of modern army surgery, AMBROISE PARÉ, are silent on this subject. At last, toward the end of the seventeenth century, we find a detailed example of recovery from a shot wound of the hip. MATTHIAS GOTTFRIED PURMANN (*Funfftzig Sonder- und Wunderbahre Schusswunden Curen*, Frankfurt, 1721, Obs. XLIII, p. 324) relates the case of Pt. S. Kirsky, of the regiment Götz, wounded at the siege of Stettin, 1677, in the right hip by a falconet ball, injuring ilium and upper portion of femur. Recovery in twenty weeks, with complete anchylosis of hip. In the writings of English surgeons of the time, in GALE, WISEMAN, BROWN, and RANBY; among the Germans who were then eminent for treating of shot wounds, HEISTER, THEDEN, and SCHMUCKER; and of French authors who refer particularly to shot wounds of the joints, like LEDRAN, GARENGEOT, and FAUDACQ, we look in vain for instances of shot injuries implicating the hip. MORAND and RAVATON, it is true, in the middle of the eighteenth century, advocated coxo-femoral amputation for shot fractures high up in the femur, but do not allude to any fractures at or above the trochanters. BILGUER, who cites (*Chirurgische Wahrnehmungen*, Berlin, 1763, p. 398 *et seq.*) 117 cases of shot injuries of the lower extremities during the years 1756–62, among them cases of wounds of knee and ankle joints, gives not a single instance of a shot injury of the hip joint. JEAN MÉHÉE (*Traité des plaies d'armes à feu*, Paris, An. VIII—1800), who systematically divides the wounds of the joints into three classes, those of the lower joints (ankle and wrist), middle joints (knee and elbow), and upper joints (hip and shoulder), and who cites numerous examples, only gives examples of wounds of the shoulder joint in the last-named class, and entirely omits wounds of the hip joint. The next definite instance of shot injury of the hip joint found in surgical annals is remarkable on several accounts. The case is recorded by Dr. JAMES JOHNSTONE, of Worcester, in the *London Medical Journal*, 1786, Vol. VIII, pp. 135–140. Dr. JOHNSTONE took pains to have prepared a drawing the size of nature, representing the exfoliated fragment of the head of the femur, which is accurately copied in the annexed wood-cut, FIGURE 24. The case was attended by Mr. JOSEPH BRANDISH, a "deserving surgeon and apothecary, at Alcester," and has been sometimes cited as an early example of excision at the hip for shot injury. Mr. BRANDISH treated a lad aged 12, who had accidentally shot himself December 23, 1783. The contents of the gun "passed into the upper part of the thigh, adjoining to the middle of the groin, and came out about the middle of the glutæus maximus." Several successive abscesses were formed, and several exfoliations came away; one, in particular, which appeared to be a considerable portion of the head of the thigh bone with a shot sticking in it. Much as Baron LARREY has to say of operations at the hip joint, he only once describes a case of shot fracture involving the hip. It appears in the *Clinique Chirurgicale* (1836, T. V, p. 242): A young officer of the 9th demi-brigade of Infantry of the army of Egypt, at the siege of Alexandria, was wounded at the outer and upper part of the left thigh, the ball embedding itself in the neck of the femur. The officer recovered with anchylosis of the hip. The presence of the missile was not recognized until after the death of the patient, at Bruxelles, twenty years after the injury. The specimen was presented to Baron LARREY by Dr. SEUTIN, and ultimately was deposited in the Museum at Val-de-grace. Professor LEGOUEST had a drawing made of it, which is copied in the adjacent wood-cut (FIG. 25). The chief British surgical authorities in the great Napoleonic wars, HENNEN, GUTHRIE, and BALLINGALL, cite no cases of shot wounds of the hip. HENNEN, in his classical *Observations*, dwells (3d ed., 1829, p. 158) on the extreme difficulties of detecting the course of balls lodged in this region. "I have seen," he remarks, "balls lodged in almost every part of the trochanters, neck and head of the bone, and yet the most accurate examination during life did not lead to a discovery of their situation." Dr. JOHN THOMSON (in his *Report of Observations made in the British Military Hospitals in Belgium after the Battle of Waterloo*, 1816, p. 123) refers to a case of wound of the hip joint, in which the ball lodged; paralysis was produced, and great swelling of the foot and leg supervened; and to another case, in which the head and neck of the thigh bone together with the acetabulum were, at the autopsy, found in a diseased state; and to one or two other cases which seem to have progressed favorably but were not followed up to the final issue; and to other instances where the ball, without penetrating the capsule of the joint had injured the parts around it, inducing abscesses in the joint and ulceration of the articular cartilages, with softening and absorption of the head and neck of the femur. Writers on more recent wars have cited but few cases and very few of recovery. MÉNIÈRE (P.) (*L'Hotel-Dieu de Paris en Juillet et Aout*, 1830, Paris, 1830, p. 16) gives the case of M. Firer, aged 23, shot fracture of head of femur. Death August 30, 1830. JOBERT (A. J.) (*Plaies d'armes à feu*, Paris, 1833, p. 247) cites two cases of recovery after shot wounds of the hip joint received in the Paris Revolution of 1830. BAUDENS (M. L.) (*Clinique des Plaies*, etc., Paris, 1836, p. 445) relates a fatal case, in which the ball had perforated the head of the femur, in Algiers, November 15, 1835, and adds: "Had I remained at the Algiers Hospital I should have practised disarticulation or resection." ALCOCK (J.) (*Obs. on Injuries of the Joints*, in *Med.-Chir. Transact.*, 1840, Vol. XXIII, p. 261) tabulates four cases of shot wounds of the hip; but in two only the joint was primarily involved; both were fatal. MACLEOD (G. H. B.) (*Notes on the Surgery of the War in the Crimea*, London, 1858, p. 309) relates the case of A. McPhail, aged 33, wounded at Dubba, March 24, 1843, by a matchlock ball, which entered anteriorly above the great trochanter of the right limb. The wound in the skin cicatrized; but the patient died of tetanus, May 9, 1843. The ball was found embedded in the head of the femur, having fractured the brim of the acetabulum. The specimen is preserved in the Fort Pitt Museum, and numbered 2604. HYRTL (J.) (*Handbuch der topog. Anatomie*, Wien, 1865, p. 534) relates the case of a member of the national guard, wounded in 1848; the neck of the femur was fractured; the

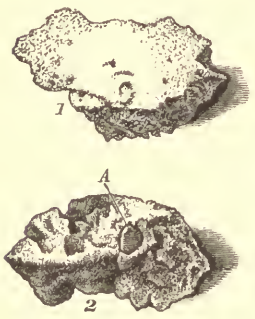

FIG. 24.—Carious fragment of the head of the femur: 1. Outer surface of exfoliation; 2, same bone, showing cancellous surface with (A) lead shot sticking in it. [After JOHNSTONE, *op. cit.*]

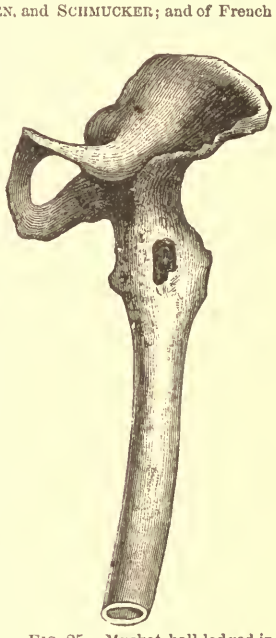

FIG. 25.—Musket ball lodged in the neck of the left femur. [After LEGOUEST.]

credit of surgery, and still more the interests of humanity, imperatively require that the most favorable periods and conditions of treatment should be diligently sought. Drs. H. H. Smith,[1] H. Fischer,[2] E. Klebs,[3] B. Langenbeck, and other modern writers on military surgery, have dwelt on the inaccessibility of the parts to exploration through the long narrow shot tracks produced by missiles of comparatively small calibre, on the frequent absence of shortening or displacement, or escape of synovia, or indeed with scarcely any serious disturbance of the functions of the joint, until the inflammatory and infiltration

---

patient recovered. STROMEYER (L.) (*Maximen, u. s. w.*, Hannover, 1855, p. 756) tabulates five cases of shot fractures of the neck of the femur from the Danish War, 1848–1850; all were fatal. Two of these five cases are detailed by Dr. H. SCHWARTZ (*Beiträge zur Lehre von den Schusswunden*, Schleswig, 1854, p. 143). J. J. COLE (*Military Surgery*, etc., London, 1852, p. 136) cites a case of fracture of the neck of the femur during the war in India, 1848–49, but the result is not recorded. BERTHERAND (A.) (*Campagnes de Kabylie*, Paris, 1862, p. 301) relates the case of Mohammed ben Achmed, shot in the right hip joint at Icheriden, June 25, 1857; death, August 31st. MATTHEW (T. P.) (*Med. and Surg. Hist. of Brit. Army*, London, 1858, Vol. II, p. 351) refers to three cases of wounds of the hip joint in the Crimean War, which proved fatal in a few hours. CHENU (J. C.) (*Rapport au Conseil de Santé des Armées de Campagne d'Orient*, Paris, 1865, p. 372) tabulates 30 cases of shot wound of the hip joint, of which two recovered. The same author (in *Rapport, etc., de Campagne d'Italie*, Paris, 1869, T. II, p. 690) groups 26 cases of shot wounds of the coxo-femoral region, of which 16 recovered, but it is not even indicated whether the wounds were fractures or simple flesh wounds. DEMME (H.) (*Mil. Chir. Studien*, Würzburg, 1861, p. 252) details two cases of recovery after shot fractures of the bones of the hip joint. HEINE (C.) (*Die Schussverletzungen der Unteren Extremitäten*, Berlin, 1866, p. 365) records four cases of shot wounds of the hip joint from the Schleswig-Holstein War of 1864; all proved fatal. STROMEYER (L.) (*Erfahrungen über Schusswunden im Jahre* 1866, Hannover, 1867, p. 8) tabulates four fatal shot fractures of the hip joint treated at Langensalza. LANGENBECK (B. v.) (*Über die Schussverletzungen der Hüftgelenke*, in *Arch. für Klin. Chir.*, 1874, B. XVI, p. 270) relates the case of Major J. Preuss, wounded in the hip joint at Münchengratz, June 28, 1866. The patient died September 13, 1867; and another fatal case of a soldier wounded in 1864. In the latter instance, the autopsy showed that the ball had entered the outer point of the left trochanter major and passed through the neck of the femur in its length into the acetabulum. BRUCE (A.) (*Observations in the Military Hospitals of Dresden*, London, 1866, p. 24) describes the case of a Prussian wounded at Sadowa, July 3, 1866, which terminated fatally. BIEFEL (R.) (*Im Reserve-Lazareth*, in LANGENBECK'S *Archiv*, B. XI, p. 441–2) treated a case of shot fracture of the hip joint at Landeshut, in 1866, which proved fatal on the 17th day. In the *Archiv für Klinische Chirurgie*, Berlin, 1874, B. XVI, p. 309, B. v. LANGENBECK tabulates 25 cases of recovery and 63 fatal cases after shot wounds of the hip joint, during the Franco-Prussian War, 1870, collected from various sources. Among the cases of recovery he cites the case of R. Rousseau (CASE 12, p. 313), observed by Dr. SCHINZINGER, although the latter (*Das Reservelazareth Schwetzingen*, Freiburg, i. Br. 1873, p. 56) distinctly states "hip joint intact" *(Hüftgelenk intact);* also the case of Schæfer (CASE 19, p. 315), observed by SOCIN (*Kriegschir. Erf.*, Leipzig, 1872, p. 135), who remarks that the patient died, on the 188th day, of exhaustion. Of the ten cases treated by himself, Professor LANGENBECK had the satisfaction of recording eight recoveries. Stabsarzt DEININGER, of the Railway Battalion *(Beiträge zur den Schussfracturen des Hüftgelenks unter besonderer Berücksichtigung der Erfahrungen aus dem Feldzuge* 1870–71, *und Benutzung der Acten des Königlichen Kriegsministeriums*, in *Deutsche Militairärztliche Zeitschrift*, 1874, B. III, p. 314), in his statistics describes 66 cases of shot wounds of the hip joint, of which 13 recovered. All but 15 of these cases are contained in von LANGENBECK'S enumeration. Of the 15 cases not contained therein (CASES 5, 6, 7, 8, 31, 32, 33, 37 [Recovery], 38 [Recovery], 49, 50, 51, 54 [Recovery], 56, 58), 12 were fatal while only 3 recovered. Besides the cases collected by Professor von LANGENBECK and Dr. DEININGER I have found the following from the Franco-Prussian War of 1870–71, not contained in the tables of either. Assistant Surgeon EVERS, Saxon train battalion No. 12 (*Gelenkwunden und ihr Ausgang*, in *Deutsche mil-ärztl. Zeitschrift*, 1874, B. III, p. 381), gives the case of Fröde, wounded August 29, 1870; ball penetrated the right hip joint; patient recovered but is totally disabled. LOSSEN (H.) (*Kriegschir. Erf. etc.*, in *Deutsche Zeitschrift für Chir.*, 1873, B. II, p. 64), case of Th. Margaillon, 22d French Infantry, shot wound of neck and trochanter of left femur, August 18, 1870; died September 4, 1870. MAYER (L.) (*Kriegschir. Mitth., etc.*, in *Deutsche Zeitschrift für Chir.*, 1873, B. III, p. 47), case of Sommerfeld, 3d Prussian Jægers, shot fracture of head and neck of femur; fatal. The cases referred to in this note give a total of 173 cases with 38 recoveries, 134 deaths (a fatality of 77.9 per cent.), and one result unknown.

[1] SMITH (H. H.) (*The Principles and Practice of Surgery*, 1863, Vol. I, p. 526) says: "The diagnosis is difficult, as the joint lies so very deep as to be almost beyond the reach of the finger. There may be neither shortening of the limb nor eversion, and at first the patient may be able to move the limb without very much pain."

[2] Professor H. FISCHER, of Breslau, in his *Kriegschirurgische Erfahrungen Vor Metz* (Erlangen, 1872, p. 201), remarks on the difficulties encountered in diagnosticating wounds of the hip joint: "The deep position of the hip joint, strongly protected by thick layers of muscles; the generally long wound-canal, the termination of which is so difficult to determine; the absence of all severe disturbance of the functions of the joint, and the very trivial subjective complaints of the patient, render it often impossible to determine precisely the lesion soon after the injury. All authorities, from LARREY and GUTHRIE to contemporary surgeons, agree in this. LEGOUEST relates (*Chirurgie d'Armée*, 2e éd., 1872, p. 449) that a zouave, who, at the Alma, received a shot in the hip, traversing from the groin to the buttock, and completely fracturing the upper rim of the cotyloid cavity, yet still walked about for ten days, escaping all our explorations," and adds that this apparent innocuity or benignity led into error our young surgeons and the patients themselves; the former not daring to propose, and the latter utterly rejecting, the sole means of averting the almost inevitably-fatal termination. "In the case of our patient Emmerich," Dr. FISCHER continues, "the ball had lodged in the shattered head in the hip joint. He moved about for some time after the injury and even from one bed to another a short time before his death, from syncope. The wounded man, Henkel, also reported that he had walked a considerable time on his injured limb. This remarkable insensibility in the hip joint immediately after shot injury, if one reflects on the ordinary painfulness at the head of the femur in coxitis, appears to be explained only by the supposition of a contusion-paralysis, or direct severing of the sensory nerves of the hip joint. In the course of time a view of the injury generally becomes clearer and the diagnosis easier. In Henkel's case, the characteristic pains at the knee joint set in, and the local pains at the hip joint were also present; but with other patients these highly important diagnostic symptoms remained entirely absent. In Henkel's case the head of the femur was intact and its sensibility therefore undisturbed. Profuse suppuration, early septic infection and prostration, and the necessity of making counter openings, always led us, unfortunately too late, to the diagnosis. But here the question may be asked of what use is an accurate diagnosis if no help can be rendered when attained. It is for this reason that I deplore the difficulty, nay, impossibility, of the same so much, because I believe that primary excision at the hip would be the best method of treatment for shot fractures at the hip, no matter how difficult the operation might be. All later operative interference is frustrated by the exhaustion and septic infection of the patients, by extensive and profuse suppuration, and by phlegmonous and gangrenous processes in deep tissues about the pelvis."

[3] KLEBS (E.) (*Beiträge zur Pathologischen Anatomie der Schusswunden*. Leipzig, 1872, p. 29) observes: "The shot injuries of the hip joint that I had occasion to observe had this in common, that they proved fatal at a comparatively early date, viz: at from thirteen to twenty-four days; and also that even in the more protracted cases no vestige of a healing process was apparent." And, on page 34, he adds: "As you may surely depend upon the fact, that in all cases where the ball does not perpendicularly strike the spongy substance of the neck considerable fracture, generally into the joint, exists, and that these fissures, even after four weeks, show no inclination towards reparation; but that they offer the most favorable conditions for infection, namely thrombus of the veins; a cure without operation, according to my judgment, is absolutely not to be expected, and the dictum of the American Circular No. 6, 1865, S. 61, in which, on account of the absolute incurability of these fractures 'when abandoned to the resources of nature,' the excision of the head of the femur was recommended, has again been sadly confirmed by the experience of this war."

period arrived. The dictum of Hennen, cited at the outset of this Section,[1] that the difficulties of early precise diagnosis in shot injuries of the hip joint are sometimes insuperable, is corroborated by Dr. F. H. Hamilton[2] in reviewing the surgical experiences of the American civil war, and by Drs. Billroth[3] and Deininger[4] in recording their personal observations and the contemporaneous surgical literature of the Franco-German War of 1870–71.

The evidence regarding shot injuries of the hip joint presented in the annals of the protracted American civil war is numerically very imposing; yet attempts to analyze it with a view to learn the principles that should govern the treatment of these grave injuries are beset with difficulties. The abstracts of the individual cases are for the most part wanting in precision, still the material must be classified and consolidated as systematically as practicable, and permitted by the character of the reports.

In the preliminary surgical report made by me in 1865, in *Circular* 6, S. G. O.,[5] at page 31, ninety-seven cases of shot fractures involving the hip joint were tabulated, and some of the more remarkable cases were detailed and several were illustrated by drawings. In 1867, in a monograph on amputations at the hip joint,[6] fifty-three examples of that operation practised during the civil war in America were described, and seven cases were narrated that resulted favorably under conservative measures, although it was alleged, though not absolutely demonstrated, that the shot lesions described involved the articulation at the hip. In 1869, in a report of excisions of the head of the femur for shot injury,[7] I detailed sixty-three instances of this operation performed during the American civil war, with minutes of a number of doubtful or not well authenticated cases; and narrated the facts collected respecting two hundred and seventy-four examples of shot wounds believed to implicate the hip joint and treated either by extracting fragments or by strictly expectant measures. In 1871, in a report on surgical cases treated in the army of the United States from 1865 to 1871,[8] the histories of four examples of shot fractures involv-

[1] HENNEN (JOHN) (*Principles of Military Surgery*, 2d ed., 1820, p. 155, cited in foot-note 1, p. 61, *ante*.). He asserts emphatically: "In some of these cases the course of the ball is so obscure, and its place of lodgement so uncertain, that it can only be detected after death. I have seen balls lodged in almost every part of the trochanters, neck, and head of the bone, and yet the most accurate examination during life did not lead to a discovery of their situation."

[2] Professor FRANK H. HAMILTON (*Princ. and Pract. of Surgery*, 1872, p. 407), while regarding the results of excisions at the hip as favorable in comparison with those obtained in amputations at the hip joint, and possibly when compared with the results of the expectant plan, concludes: "I see, in the probable inaccuracy of diagnosis, in both classes of cases many sources of error. Indeed, in my opinion, the surgeon is still justifiable in exercising a considerable amount of discretion as to the course to be pursued. If, for example, he has reasons to believe that the comminution is not extensive, and the patient is in a favorable condition as to health; if he is neither very fat nor very muscular; if the limb can be kept at rest and moderate extension continuously applied, I believe an attempt may be properly made to save the limb without excision."

[3] BILLROTH (TH.) (*Chirurgische Briefe aus den Kriegs-Lazarethen*, u. s. w., Berlin, 1872, S. 238). In the foot-note No. 3, on page 26, of the preceding Section, some of Professor BILLROTH'S emphatic declarations on the occasional impossibility of diagnosticating direct shot injury of the capsule or bones of the hip joint have been cited. The length of the shot canals and the great variety of direction in shot perforations of the muscular masses about the coxo-femoral articulation, greatly modified by the changing postures of the soldier, are great obstacles to satisfactory explorations, and, owing to the form of the pelvic bones and ligaments, the course of the missile is very liable to be deflected. The index finger is generally too short to reach the projectile or fracture, and a sound or catheter is but a poor substitute. Moreover, the surgeon is puzzled by the absence of symptoms he has been taught were pathognomonic. In none of the cases examined by BILLROTH and CZERNY was found the displacement and peculiarity of position usually ascribed to fractures implicating the hip; and the characteristic intense pain in the hip and knee, aggravated on motion, was missing in many instances. Space forbids further citations, but the reader may profitably consult the comments of the Viennese professor on this difficult subject.

[4] DEININGER (*Beiträge zu den Schussfracturen des Hüftgelenks*, u. s. w., in *Deutsche Mil.-ärztl. Zeitschrift*, 1874, Jahrg. III, p. 237): "The difficulty of diagnosing a hip joint fracture in its first stages is very great, and frequently it can only be ascertained in the subsequent course whether the joint is really injured, and, sometimes, the fracture is not ascertained until after death. For instance, in the preparation exhibited by TRENDELENBURG in the Second Congress of the *Deutsche Gesellschaft für Chirurgie*, the *Langblei* ball had comminuted the head and neck of the left femur and lodged among the fragments of the head of the bone; a slight fissure existed in the acetabulum. The patient died in consequence of purulent infiltration; during life it was not possible to determine with certainty an injury of the joint. The fragments had been held together by the periosteum, and a dislocation was not indicated. Even walking on the injured limb is no proof that the hip joint has not been fractured." Dr. DEININGER (*l. c.*, pp. 238 and 245) refers to 12 cases in which the injured limbs could be used for some time after the injury, although the autopsy subsequently proved fracture of the joint.

ing the hip joint were detailed, one resulting fatally under expectant measures, and three treated by formal excision, of which two recovered and one had a fatal result.

Three hundred and eighty-six cases of shot fracture directly involving the articular surfaces at the hip are found recorded in the returns of the Union and Confederate armies. Though the reports are, in many instances, very imperfect, they permit an approximate analysis of the cases in TABLE IX following, according to the particular portion of the articulation injured, and also with reference to the treatment of the cases, either by rest and suitable position, with splints and extension and other expectant measures, or by freely incising the joint and removing, if necessary, fragments of bone, projectiles, or other foreign bodies, cases numbering three hundred and four,[1] and grouped as treated by conservation; and then follow two groups treated by formal operative interference, a series of fifty-five cases of excisions at the hip, and a series of twenty-seven cases of amputations at the hip.

TABLE IX.

Tabular Statement of Three Hundred and Eighty-six Shot Fractures of the Hip Joint.

In discussing the two series of excisions and of amputations at the hip, eleven instances must be added to the first, and thirty-nine to the second, in which the operations were practised for shot fractures of the shaft of the femur that did not primarily implicate the hip, or for injuries of the knee joint, thus giving a total of four hundred and thirty-six

[1] In *Circular* No. 2, S. G. O., 1869, from pages 65 to 106, two hundred and seventy-four abstracts of shot wounds at the hip joint were recorded as treated on the expectant or conservative plan, with forty-nine recoveries. Of these, forty-seven, with fifteen recoveries, are omitted from TABLE IX. Of this category of forty-seven, 22, with 7 recoveries (CASES 165–186, inclusive, of *Circular* 2, pp. 90–92), and 12 cases, with 2 recoveries (CASES 187–198, inclusive, of *Circular* 2, pp. 92–94), are discarded, the former as uncomplicated by fracture, and the latter as examples of secondary traumatic arthritis. These thirty-four cases have already been referred to in SECTION I, at page 26, *ante*., under the head of *Peri-articular Wounds*. Twelve cases, with two recoveries (CASES 216–227, inclusive, of *Circular* 2, pp. 96–98), are postponed for consideration in SECTION III, as instances of fractures of the trochanteric region, in which the hip joint became secondarily involved. One case of recovery (CASE 224, *Circular* 2, p. 100) has been transferred to a future chapter, later information having proved that the injury was not inflicted by shot. On the other hand there were added to the cases summed up in *Circular* 2, 66 cases, with 18 recoveries, since discovered and not heretofore published; 4 cases, with 1 recovery, already published in the *Second Surgical Volume* (CASES 859, p. 295, 920, p. 317, 922, p. 318, and 935, p. 324); 5 cases, with 1 recovery, referred to in *Circular* 2, but not included in the enumerated list (CASES of Swanson, Greenwood, p. 113, Scott, p. 114, and CASES of Drs. AVENT and BRUNS, p. 57); 1 case of recovery (CASE of Sweeney, noted in *Circular* 7, S. G. O., 1867, p. 73); and 1 fatal case (*Circular* 2, p. 92, CASE 184), reported in *Circular* 2 as a case in which the hip joint was involved but uncomplicated by fracture. The specimen, since received (*Specimen* 2994, A. M. M.), conclusively proves the fracture.

cases to be considered in the three following subsections. If the conclusions deducible from these numerous examples are in many respects unsatisfactory, it may be borne in mind that the surgical experiences of the Six Weeks' Prusso-Austrian War of 1866, of the Franco-German War of 1870–71, and of the Russo-Turkish War of 1876–77, have not so far proved more fruitful in results tending to solve the difficulties that beset the subject.

SHOT FRACTURES AT THE HIP TREATED BY CONSERVATION.—Three hundred and four cases in which shot wounds at the hip were believed to have been attended with fracture of the articular surfaces were treated on the expectant plan,[1] or with such incisions and removals of fragments or foreign bodies as was consistent with a true conservative treatment.

Five modern writers on military surgery,[2] the late Dr. H. Demme, of Berne, Professor

[1] Professor B. VON LANGENBECK, in seeking for examples of recoveries after shot wounds of the hip joint (*Ueber die Schussverletzungen des Hüftgelenks*, in *Archiv für Klin. Chir.*, 1874, B. XVI, p. 265) finds none recorded prior to recent wars, "apart from a case communicated by HENNEN, in his classical work (*Observations on Some Important Points of Military Surgery*, Edinburgh, 1818, p. 172), and several cases mentioned by THOMSON (*Report of Observations made in the British Military Hospitals in Belgium*, Edinburgh, 1816, p. 123) of hip joint wounds which seemed to have progressed favorably, but were not followed up to the final issue;" but it can hardly have escaped Professor LANGENBECK'S notice, in HENNEN'S account of his CASE XXVII, of Spontaneous Luxation of the Hip Joint, that HENNEN says: "Whether the luxation in this case was produced from a primary injury of the bone, or of the cartilages, and sebaceous glands of the joints, or from a secondary scrofulous affection, it is impossible to say with certainty," and by no means cites this instance of the mounted officer, wounded July 22, 1812, as an instance of recovery from shot wounds of the hip joint. In a later portion of his work, Dr. JOHN THOMSON (*Report of Observations * * after Waterloo*, Edinburgh, 1816, p. 275) observes: "The proportion of cures which has been obtained from amputation at the hip joint is, I believe, much greater than of cures from gunshot fractures of the head or neck of the thigh bone. Indeed, of recoveries from these injuries I know of none which have been recorded. Those who, for a time, seem to do well, in the end sink under the hectic which supervenes. This has been the fate, I believe, of the two cases which I have mentioned in the account of injuries of the hip joint as having put on a favorable appearance." With such examples, the propriety of caution in admitting recoveries after shot wounds at the hip as incontestable is apparent. Dr. RICHARD M. HODGES (*The Excision of Joints*, Boston, 1861, p. 94) observed: "The extent of injury, and the condition of the parts after a gunshot wound of the hip joint, are as notoriously difficult to determine as the cases are certain to terminate fatally. Even when the upper part of the femur has been shot through, shortening, rotation outwards, and crepitus are not always present, and sometimes a very considerable power of flexion and extension remains." After citing GUTHRIE'S famous picture (*Commentaries, etc.*, 6th London ed., 1855, p. 77) of "a man lying with a small hole either before or behind in the thigh,—with no bleeding, no pain, nothing but an inability to move the limb, to stand upon it,—and think that he must inevitably die in a few weeks, worn out by the continued pain and suffering attendant on the repeated formation of matter burrowing in every direction, unless his thigh be amputated at the hip joint, or he be relieved by the operation of excision, which, I insist upon it, ought first to be performed," Dr. HODGES declared that: "By following an expectant course and trusting to the resources of nature, an almost invariable mortality will ensue. A case occurring at the battle of Solferino, diagnosticated as fracture of the neck of the femur, and another seen at Nantes, in 1830, by M. BOINET, are the only recoveries I am aware of which have followed gunshot wounds of the hip joint." Dr. HODGES refers to the two exceptional recoveries after Solferino and Nantes in *L'Union Médicale*, 28 Juin, 1860. The discussion of the *Société de Chirurgie* here given, from p. 605 of *L'Union Médicale*, is, in that journal, erroneously attributed to May 30, 1860. The discussion was on June 6, 1860, and is correctly reported in the *Bulletin de la Société de Chirurgie de Paris*, 1861, 2me sér., T. I, p. 326. The Solferino case refers to a soldier, wounded June 24, 1859, and presented before the *Société de Chirurgie* June 6, 1860, by M. LEGOUEST. This soldier, after receiving shot wounds of the left shoulder and of the neck of the left femur, the latter ball entering anteriorly and passing out through the sciatic notch, entered the hospital at Cremona. Numerous and large splinters were extracted. The neck of the femur perfectly consolidated, with three centimetres shortening. M. BOINET mentioned "a man wounded at Nantes, in 1830, by a shot fracture of the neck of the femur with grave complications, now perfectly cured, and able to take long walks notwithstanding the anchylosis that had followed the accident." (See *Circular* 2, S. G. O., 1869, p. 65.) Professor RICHARD VOLKMANN (*Die Resectionen der Gelenke*, in his *Sammlung Klinischer Vorträge*, Leipzig, 1873, No. 51, p. 301), speaking of the American statistics of excision and exarticulation at the hip for shot injury, declares that they "demonstrate that after both operations only exceptionally a patient survives; but that also, under a purely conservative treatment, the result is invariably none better, on the contrary, rather still somewhat worse. The wounded with shot fractures of the hip joint about nearly all perish. This is also the experiences which we, who participated in the two last great wars, the Austro-Prussian and Franco-German, alas, could only confirm. I myself saw only fifteen instances of this injury. Three times I performed resection, twice after the battles of Beaumont and Sedan, once in Dijon. All three patients died; two, as I believe, chiefly from the consequences of a coexisting decubitus; in a third an extensive comminution of the pelvis was found at the resection; but the remaining, about twelve cases treated conservatively, also perished. Among them also one in which the head of the femur, separated by the ball and split in two halves, was extracted by an incision opening the joint. Only one patient I see still now and then, who, at Toul, received an undoubted intracapsular shot fracture of the neck of the femur, but which had not been diagnosticated, and who recovered, after exfoliation of several pieces of bone with relatively little shortening, and with anchylosis of the joint." LOHMEYER (C. F.) (*Die Schusswunden und ihre Behandlung*, Göttingen, 1859, S. 198) remarks: "An operation for the simplification of the wound, in cases where the acetabulum has been crushed, is naturally out of the question; but, in cases of comminution of the head or neck of the femur with injury of the capsule, one is called upon to operate, as such injuries, without artificial help, uniformly prove fatal after the patients have undergone terrible suffering." LÖFFLER (F.) (*Grundsätze und Regeln für die Behandlung der Schusswunden im Kriege*, Berlin, 1859, Erste Abtheilung, p. 66), speaking of shot injuries of the hip joint, remarks: "The conservative treatment of this injury, according to the experience hitherto acquired, gives no prospect of saving life. Even if pyæmia does not supervene, death ensues sooner or later from exhaustion following endless suppuration." With such testimony as the foregoing, together with that of Drs. H. FISCHER and E. KLEBS, in the foot-note to page 63, *ante*, we are indisposed to concur in the declaration of Dr. SAMUEL W. GROSS (*Military Surgery*, in *Am. Jour. Med. Sci.*, 1867, Vol. LIV, p. 447) that "those surgeons who pointedly condemn all efforts to save the limb after gunshot fracture of the surgical or anatomical neck of the thigh bone, exercise, in our judgment, but little discrimination, when they declare, as does the surgical historian of the late American War, that 'experience has demonstrated the uniform fatality of gunshot fractures of the head or neck of the femur when abandoned to the resources of nature.'" and that "*no statement can be farther from the truth.*" The compiler of the surgical report in *Circular* No. 6, S. G. O., 1865, might have said "*almost* uniform fatality," but his statement, if lacking qualification, was assuredly not widely apart from the truth.

XVI, p. 263, and translated as *Surgical Obs. on Gun-shot Wounds of the Hip-Joint*, by JAMES F. WEST, F. R. C. S., in *Birmingham Med. Review*, Vol. V, 1876, pp. 29, 88, 167.

Hospital on May 10, 1862. A conoidal musket ball had entered the right groin, passed slightly downward, traversed the line of union between thigh and trunk, fractured the neck of the femur in its transit, and emerged posteriorly at the fold of the buttock. On flexing or rotating the thigh crepitus was plainly distinguished. His limb was suspended by Smith's anterior splint, and this treatment was continued for two months. The case progressed without a single untoward symptom, and in the middle of July, 1862, consolidation of the fracture was sufficiently firm to permit the patient's removal to the house of a friend. The limb was shortened one and a half inches. In October Captain Bugh was able to move about on crutches, and the wounds were entirely healed. About this time he took a journey to Washington, and was promoted to a lieutenant colonelcy in the 32d Wisconsin and placed on recruiting service. He served until April 25, 1863. His recovery was so rapid and uninterrupted that he reluctantly assented to the opinion of his surgeon, Dr. Edmund G. Waters, that he would be incapable of active duty in the field. A letter was received from Lieutenant Colonel Bugh, dated June 12, 1867, more than five years subsequent to his injury, in which he stated that he had partial anchylosis of the hip joint and was unable to perform any labor in a stooping posture. Otherwise his condition was satisfactory, though he was more readily fatigued and debilitated than before he was wounded. He suffered no inconvenience from the slight shortening of the femur. His death occurred eight years afterwards, on August 19, 1875, of phthisis pulmonalis. Examining Surgeon N. M. Dodson, of Berlin, Wisconsin, informed this office on December 13, 1878, that "no *post-mortem* was had in the case of Captain Bugh. The wound healed in 1866, and the limb remained sound afterwards. Bugh filled the position of postmaster, was much upon his feet, and residing for some years three-quarters of a mile from the post office, he walked to and fro three times a day with very little inconvenience, using only a cane. The joint was firmly anchylosed. He suffered from pain of a neuralgic character in the whole limb, and at night frequently with cramps in leg and foot."

CASE 138.—Private *J. T. Elliott*, Co. H, 22d Georgia, of Sorrell's Brigade, aged 24 years, received, at the engagement at Deep Bottom, Virginia, August 16, 1864, a gunshot fracture of the neck of the left femur. He was conveyed to Richmond and admitted to the Jackson Hospital. He recovered with three inches shortening of the limb, and being permanently disabled and totally disqualified for any military duty, he was retired from the Confederate States service on February 17, 1865. The case is reported by Surgeons A. J. Semmes, Thomas F. Maury, and W. D. Hoyt, members of the medical examining board of the Jackson Confederate Hospital, at Richmond, Virginia, in February, 1865.

CASE 139.—Private Charles Miller, Co. A, 9th Illinois, aged 26 years, was wounded at the battle of Shiloh, Tennessee, April 6, 1862, apparently by a small rifle ball entering at a point midway between the left trochanter major and the tuberosity of the ischium and fracturing the neck of the left femur. He was conveyed to the general hospital at Savannah, and a month afterward was transferred by steamer to Quincy, Illinois, and admitted to hospital on May 7th. An unsuccessful search for the missile was made, and Buck's apparatus was applied. The bone united and the wound healed. He was discharged from service on October 14, 1862, having limited motion at the hip joint. The case is reported by Surgeon R. Nicholls, U. S. V. On April 7, 1864, Dr. John C. Hupp, Pension Examining Surgeon at Wheeling, West Virginia, stated that the limb was shortened by about two inches, a partial luxation of the head of the femur upward apparently having been produced. Any movement of the thigh created severe pain. The cicatrices were firm and there were no fistulous orifices. In December, 1870, Examining Surgeon C. Griswold, of Fulton, Illinois, reported: "The ball entered posteriorly through the glutei muscles, and fracturing the femur near the socket, resulted in partially stiffened joints both at hip and knee of left leg. The hip joint will admit of only a little forward motion and rotation outward. The knee joint allows only partial flexion, and cannot be crossed over the right leg in a sitting posture. The leg is shortened about one-quarter of an inch. He cannot walk without limping." In August, 1873, Examiner P. J. Farnsworth, of Clinton, Iowa, stated: "The bullet remained in for four years, and was found under the superficial fasciæ three inches below the wound. Motion of hip joint impaired. Contraction of abductor muscles, causing stiffening and retraction of knee joint. Constant neuralgic pain of thigh and leg, and considerable atrophy of muscles. Thigh two inches less in circumference than right at upper third. The original disability has increased." On May 1, 1878, the Davenport, Iowa, Examining Board reported: "There is shortening of the thigh to the extent of three-quarters of an inch, whence it is inferred that fracture of the upper portion of the acetabulum, or neck of femur, occurred; there is partial anchylosis of the knee joint. The patient walks with a cane with considerable impairment of motion."

CASE 140.—Private *T. L. Lomax*, Co. K, 30th Virginia, wounded at Antietam, September 17, 1862, and admitted to hospital No. 5, Frederick, on October 20th. Dr. A. V. Cherbonnier communicated, in June, 1869, that "it was supposed, when *Lomax* was admitted to hospital, he was merely suffering with a fracture of the thigh, high up, with no accurate knowledge of the extent. He was removed to a private residence, and after removal his limb was explored and a full knowledge and extent of the injury was ascertained. The injury was found to be serious, involving the upper portion, the trochanter, and, if I remember correctly, the neck. In the presence and with the assistance of Surgeon H. S. Hewit, U. S. V., and Assistant Surgeon J. H. Bill, U. S. A., I removed all the fragments of bone, and with the gouging forceps removed a considerable portion of dead and rough bone. The operation was repeated a couple of weeks after. The whole of the trochanter major was removed, going deep into the shaft, and leaving, if I remember correctly, but a shell of bone. When I left Frederick I had the satisfaction of seeing young *Lomax* on crutches. I cannot, with no notes, do justice to what I consider a most interesting case," etc. Surgeon Hewit, in a note dated July 26, 1869, stated: "It was *a case of comminution of the hip*. Three secondary operations by gouging were performed by myself, in which nearly *all the head, neck, and trochanteric portion* of the femur were removed. He subsequently made a good recovery." Dr. G. Johnson, of Frederick, subsequently, on October 21, 1869, furnished the following details of the case: "Mr. *Lomax* was wounded in the left hip. The ball struck the femur, shattering it by his account, but producing no solution of the continuity. He remained in the temporary hospital near the battle-field for weeks, was then brought to Frederick, and on October 31st was transferred to a private residence and came under my charge. His strength at this time was gradually succumbing to profuse suppuration and pain, and although he rallied somewhat at first by the change of circumstances and improved hygiene, it soon became apparent that surgical interference was demanded to arrest the downward tendency. Until this time his only treatment had been the abstraction of detached pieces of bone, detergent washes to the wound, and anodynes and tonics. Carious bone in considerable extent being evident to the probe, it was determined to attempt its removal, and on

November 15th Drs. Hewit and Charbonnier operated for that purpose, under chloroform. A large quantity of diseased bone was removed from the outer part of the upper third of the femur. There was but trifling hæmorrhage, but much depression and irritability of stomach succeeded the operation, yielding, however, in a few days, to stimulants and effervescing draughts. For a fortnight the patient steadily improved under nourishing diet and tonics. He then again began to deteriorate under increasing suppuration, and on December 15th it was determined to again operate for the removal of diseased bone. This was accordingly done on that day by Dr. Hewit, the patient being under chloroform. The great trochanter and about two-thirds in circumference of the shaft of the femur were removed for several inches. The depression consequent was not so great as before, but on December 17th congestion of the right lung occurred, with expectoration of a quantity of typhoid pneumonic sputa. I painted the chest thoroughly with iodine tincture, and gave hydrochlorate of ammonia, with milk punch and animal soup. No consolidation of the lung occurred, and after a few days his chest gave no further trouble. I will not weary you with a detailed account of his symptoms and treatment during the four months ensuing. There was at no time any inflammation of the hip joint. Erysipelas twice gave much trouble, as also the usual disposition in such cases to form purulent sinuses. On January 23, 1863, I noted hard and excessive swelling of the limb, with grave constitutional disturbance attributed to lymphatic inflammation, and after this subsided much œdematous infiltration. Pieces of carious bone became from time to time detached, and were removed as soon as detected; the feeble circulation was supported by careful bandaging; the wound was kept thoroughly clean and his hygiene perfect. He took exercise in the open air in carriage and on crutches as soon as strength permitted, and in May was quite convalescent. June 8th, he left Frederick for exchange, still on crutches and wound discharging slightly, but looking healthy—almost robust. A year after, he wrote that he was perfectly well and walked comfortably with a cane. In mentally reviewing this case some points of interest occur to me: As to the cause of so extensive a caries—this was a true bone ulcer. The several operations did not consist of merely removing sequestra or detached portions of dead bone, but in paring and pinching off the diseased bone from that which was still sound. The ulceration was progressive. The second operation was more extensive than the first and at a month's interval. These facts are consistent with the theory (suggested, I think, by Dr. Hewit) that the caries depended upon osteitis, and this probably caused by the peculiar velocity with which the minié ball strikes. The amount of callus effused after the final operation was immense, fully equalling the new bone of a prolonged case of necrosis, and soon allaying the fear at first felt of fracture of the continuity of the bone through muscular action or otherwise. As regards the statistical value of the case it ended well; but after an illness in which his life was in extreme jeopardy several times, and under circumstances rarely attainable in private practice, and I should think impossible in military life. The patient had full advantage of every circumstance that affection could prompt and pecuniary means procure. He was in the prime of life and entirely free from constitutional taint. He was free from depressing influences of every kind, while in his medical and surgical treatment I had the counsel and assistance of scientific and thoroughly experienced men. Among them, both he and I are under lasting obligations to Dr. Hewit, to whose operative skill, no less than to his humanity in permitting his removal from hospital, is due whatever credit may pertain to the issue of the case." The bone removed at the two operations referred to consists of a number of fragments, and was subsequently contributed to the Museum by Dr. Johnson, and constitutes *Spec.* 5652 of the *Surgical Section*.

CASE 141.—Private *M. M. Phillips*, Co. F, 42d Mississippi, aged 23 years, was wounded at the battle of Gettysburg, Pennsylvania, July 3, 1863, by a musket ball, which entered the posterior and outer aspect of the left buttock, fractured the neck of the femur, and emerged in the left groin. He was captured and removed to the hospital for Confederates, and was treated by the expectant plan. On July 22d he was transferred by rail to the De Camp Hospital, in New York Harbor. The wounds of entrance and exit had healed. He was able to walk by the aid of a crutch or cane and suffered no pain. The limb was shortened one and three-quarter inches. By flexing and rotating the limb true osseous crepitus was obtained. There was no inversion or eversion. The patient, much against his will, was placed upon a fracture-bed, where extension was produced for six weeks by a twelve-pound weight acting over a pulley. He was then permitted to rise and directed to use passive motion and friction. On September 20, 1863, he was paroled, being able to walk without assistance of any kind. The limb was shortened one and a quarter inches. The case is reported by Acting Assistant Surgeon George Edwards.

In the next case, as in the case of Private Charles Miller (CASE 139, page 71), partial anchylosis of the knee joint had supervened many years after the injury:

CASE 142.—Private James Vanderbeck, Co. F, 145th New York, aged 21 years, was wounded at the battle of Chancellorsville, May 3, 1863, by a conoidal musket ball, which entered the left thigh above and behind the trochanter major, passed forward and inward, fractured the neck of the femur, and made its exit at the groin. He was made a prisoner and remained in the hands of the enemy eleven days. He was then exchanged and conveyed to the Twelfth Corps Hospital, at Aquia Creek. The injured limb was simply placed in a comfortable position without any attempt at extension. On June 14th the patient was removed on a hospital transport to Alexandria and placed in the First Division Hospital. He was in good condition. The suppuration was comparatively slight, and no bone splinters were found loose and none had come away. Three days subsequently he was transferred to Philadelphia, and thence, on October 12th, to New York, where he was admitted to the Ladies' Home Hospital. The wounds were closed at this date. The patient was discharged from the hospital and from the service of the United States on November 19, 1863. On that date he walked with crutches. His limb was shortened two inches, with eversion. He was allowed a pension. On August 2, 1866, Dr. E. Bradley, Examining Surgeon of the Pension Bureau, reported that Vanderbeck's general health was good, but that there was much lameness. The fracture was firmly consolidated. Commissioner C. C. Cox reports that Vanderbeck received his pension at the agency in New York City on March 4, 1868, and that his disability was then rated by the examining surgeon as total. On September 9, 1873, Examining Surgeon T. F. Smith, of New York City, states: "Ball entered left nates and emerged beneath left popliteal ligament, fracturing the femur; there is union with deformity and three inches shortening." On September 7, 1875, the New York Examining Board, Surgeons T. F. Smith, J. F. Ferguson, and M. K. Hogan, report "that the knee is anchylosed and the patient is obliged to wear a sole on his shoe three inches thick, and to walk with a cane; the leg is useless for purposes of labor."

CASE 143.—Private T. C. Garvin, Co. H, 94th New York, aged 43 years, was wounded at Hatcher's Run, February 7, 1865, and admitted to the field hospital of the 3d division, Fifth Corps. Surgeon D. C. Chamberlain, 94th New York, noted: "Gunshot wound of genitals." Four days after the reception of the injury the man was admitted to the Newton University Hospital, Baltimore, whence Surgeon R. W. Pease, U. S. V., reported: "Gunshot wound of penis and right testicle, ball emerging from right gluteal region, fracturing the femur." In a case book it is recorded that Buck's apparatus and counter-extension were used, also that there was free suppuration from the wound, and that evidence of union of the bone set in about March 10th. Assistant Surgeon D. C. Peters, U. S. A., reported that the patient was admitted to Jarvis Hospital May 23d, and described the injury as follows: "Gunshot wound of penis, right testicle, and fracture of femur involving the neck. Urine escapes through the lower opening of the penis. He had some union of limb, with about three inches shortening." The patient was discharged from service June 11, 1865, and pensioned. Examiner G. W. Cook, of Syracuse, New York, certified, April 25, 1866: "Bullet struck the glans penis, passing downward and backward through the urethra, producing hypospadia, through which the urine is voided, thence into the right testicle, which is destroyed, thence into the right thigh, fracturing the same." The pensioner died January 3, 1869. Dr. A. Welch, his attending physician, certified that "to the time of his death Garvin was laboring under severe pain and difficulty from a wound which he received in the hip of the right side, passing through the joint and through the testicle, destroying the hip joint, and producing shortening of the limb, and an open wound from which pus and portions of the joint, consisting of splinters of bone, were discharged to the time of his death."

CASE 144.—Corporal Daniel Bachler, Co. G, 82d Illinois, aged 23 years, was wounded in the battle of Chancellorsville, Virginia, May 2, 1863, by a round ball, which, entering just above the right trochanter major, fractured the neck of the femur, and emerged beneath Poupart's ligament about two inches from the symphysis pubis. He stated that he lay thirteen days on the plank road unattended. He was admitted May 15th to the field hospital of the 3d division, Eleventh Corps, and was transferred thence, by steamer, to Alexandria, and admitted May 25th into the First Division Hospital. The patient had been informed that the wound involved the soft parts only; cold-water dressings had been applied. The limb was shortened about three inches. A fracture through the neck was discovered. Partial union had taken place. There was little suppuration and the pus was healthy; the parts were but little swollen. Smith's anterior splint was applied and moderate extension made by weight and pulley. He was furloughed on July 14th for sixty days, and went to Chicago, Illinois. On September 10th Bachler was received into the City General Hospital in Chicago. A gunshot wound of the right hip joint was recorded. He was transferred to the 2d battalion of the Veteran Reserve Corps on August 7, 1864. The case is reported by Surgeon Norman S. Barnes, U. S. V. The patient was discharged on July 15, 1865. The Chicago Examining Board, Drs. Wm. C. Lyman, E. D. F. Roler, and F. A. Emmons, report on September 10, 1873: "The pensioner was shot through the hip close to the joint; there was loss of some small pieces of bone, and half an inch shortening of the limb." On April 3, 1878, the Board state: "There is partial loss of flexion and of power of leg, with neuralgic pains; the neuralgia is increasing."

CASE 145.—Private James McCabe, Co. A, 12th Massachusetts, was wounded on September 17, 1862, at the battle of Antietam, by a musket ball, which entered just below the right groin and made its exit at the buttock, fracturing the neck of the femur in its passage. He was conveyed to hospital No. 5, at Frederick, Maryland, and was treated with the limb in an extended position. On November 9th he was transferred to Frederick Hospital No. 1. In December a large metastatic abscess formed about the right shoulder, which was laid open by Assistant Surgeon R. F. Weir, U. S. A., a large quantity of pus escaping. After the healing of the abscess there was much weakness of the muscles of the acromial and humeral region, and the patient could not raise his hand above his chin. On June 16th he was sent in good condition to the Jarvis Hospital at Baltimore, and thence to Point Lookout Hospital, where he remained until July 25, 1864, when, the wound being healed, he was discharged. He was mustered out of service August 5, 1864. On June 10, 1867, he was examined at the office of Surgeon General Dale, of Massachusetts. The fracture was firmly consolidated. There was but a slight limp in walking. His general health was excellent. He received a pension and was employed in the Soldiers' Messenger Corps. He experienced no pain, except on change of weather or when his walk was extended beyond two miles. He considered his injury but a slight disability in his business, since he had free passes on all the lines of horse cars in Boston.

CASE 146.—Sergeant *Edward G. Gilliam,* Co. C, 11th Virginia, aged 24 years, was wounded in the engagement at Drury's Bluff, Virginia, May 16, 1864, by a rifle ball, which, entering the upper portion of the right thigh in front, fractured the neck of the femur, and lodged. He was conveyed the same day to Richmond and admitted into Chimborazo Hospital. There was eversion of the limb, but no shortening. On placing the finger upon the seat of fracture and rotating the thigh it was observed that the trochanter major moved with the shaft. There appeared to be but little comminution, and there was no escape of synovial fluid. The parts were but little tumefied. The limb was comfortably adjusted on pillows. The patient complained of severe pain in the thigh, especially along its inner aspect, and had frequent twitchings of the muscles. The pulse was 80, the tongue clean, the appetite poor. Half an ounce of whiskey was directed every fourth hour, and a nourishing diet, with one-third of a grain of morphine given at bedtime. During the latter part of May there was severe local pain, with rapid emaciation, and a bed-sore formed over the sacrum. On June 15th the limb was swung in a Smith's anterior splint. The patient's appetite soon began to improve, the pulse about 96. On June 27th he yet suffered severe pain in the hip and along the inner part of the thigh. On July 1st synovial fluid in large amount issued from the wound, after which the pain subsided. His appetite continued to improve, and he now slept well at night. One or two small spiculæ of bone were eliminated in the discharges. On July 10th he was stronger and had no pain; the bed-sore was healing; the discharge from the wound was small in quantity, and the œdema was disappearing. For several days, about July 20th, he suffered pain at the knee, and the splint was removed. On July 30th the bed-sore was healed and his health was greatly improved; but any movement of the hip joint continued to create severe pain. By August 10th he had become stout and fleshy and could suffer the limb to be moved, and August 22d it could be moved freely without producing pain. At this date a small spicula of bone was removed. There was only a slight discharge from the wound. On September 5th he was able to raise the limb a short distance from the bed, and September 14th he sat up in a chair. There was limited motion of the hip joint. He was furloughed for sixty days on September 20, 1864. The case is reported by Surgeon E. M. Seabrook, C. S. A.

CASE 147.—Surgeon B. W. Avent reports that an officer received a gunshot fracture of the neck of the femur; two fingers at entrance and exit fully explored the wound; date of injury unknown. The wound was dilated at entrance and spiculæ was removed with saw and forceps. He lingered for months, but finally recovered with a limb four inches short, but able to walk with the assistance of a cane.

CASE 148.—Private R. Yerger, Co. I, 11th Pennsylvania, aged 31 years, was wounded at Antietam, September 17, 1862, and entered the Broad and Cherry Streets Hospital, Philadelphia, on December 12th. Surgeon J. Neill, U. S. V., reported: "He was admitted to this hospital with an undetected fracture of the neck of the right femur. A minié ball entered on the front of the thigh on a vertical line with the anterior superior spinous process of the ilium and four inches below it, and, passing obliquely upward and backward, was cut out on a line with and about two inches below the posterior superior spinous process by the surgeon of the regiment on the field. At the time of his admission the wound had entirely healed, but the patient was unable to bear weight on the limb without pain. The tissues over and above the trochanter were flattened, and the fold in the buttock was absent. Rotation was imperfect, and when an attempt was made to bear weight on the limb distinct crepitus could be felt in the neck of the bone, and he complained of pain at that point. Measurement from the xiphoid cartilage revealed two and a half inches shortening of the injured side, and from the anterior superior spinous process of the ilium it was three-fourths of an inch. The fracture appeared to be impacted, and the whole of the right innominate bone was considerably elevated above its normal position. The posterior superior spinous process of that side was also more prominent than that on the other side, giving the idea that the sacro-iliac symphysis had been injured and in that way accounting for the marked amount of shortening by measurement from the xiphoid cartilage. He stated that when shot he fell, the right hip striking the ground, and any attempt to move the limb gave rise to severe pain in the hip joint; also that the surgeon told him it was only a flesh wound and would soon be well. He remained in a field hospital for nine days, when he was removed to Chambersburg and treated for nine weeks, during which time he was allowed to get up to go to stool. The wound healed about two weeks before admission to this hospital. No fragments of bone were removed; crepitis is not so distinct, and his general condition is good. The amount of shortening from the anterior superior spinous process has increased from three-fourths to a full inch since admission." The patient was discharged from service April 27, 1863, and pensioned. Examiner J. J. McCormick, of Irwin Station, Pennsylvania, certified, September 5, 1873: "Ball entered right thigh in front of trochanter major and came out one inch from lower end of sacrum, fracturing the neck of the femur. The limb is two and one-half inches shorter than the other; strength so much impaired that he cannot walk without a cane. Muscles of limb are atrophied." In an examination for increase of pension, in April, 1880, Examiner McCormick reports: "There is great impairment of the strength and usefulness of the limb. The pensioner cannot work at all, nor can he set on a chair except a little on the left hip. The injury is nearly equivalent to the loss of the limb."

In five instances of recovery after alleged shot fracture of the hip joint the "neck and trochanters" or "the neck and shaft" of the femur were reported to have been fractured. Three of the cases[1] are here given in detail:

CASE 149.—C. F. Beyland, Q. M. D., aged 26 years, was wounded December 8, 1861, by a conoidal musket ball, which fractured the great trochanter and neck of the right femur. Excision was proposed and refused. The fracture was treated by Hagedorn's apparatus. After protracted and profuse suppuration the patient recovered with a limb shortened two inches. In July, 1863, he had dispensed with crutches and walked quite well. Assistant Surgeon C. K. Winne, U. S. A., reported the case.

CASE 150.—Corporal Luke English, Co. E, 2d Wisconsin, aged 21 years, was wounded at the battle of Gettysburg, Pennsylvania, July 1, 1863, by a conoidal musket ball, which entered at a point between the left trochanter major and the tuberosity of the ischium, emerging near the anus, penetrated the right thigh and fractured its trochanters, and lodged. He was admitted the next day into the Seminary Hospital at Gettysburg. Search for the missile was unsuccessful. Two fragments of bone were extracted. Cold-water dressings were applied. On July 17th he was transferred by railroad to York Hospital. Early in August the average discharge of pus was about four ounces. The wound of entrance had nearly closed. On November 4th he could walk a little, the wound, however, discharged considerably. He was discharged from the service of the United States on June 23, 1864. Surgeon Henry Palmer, U. S. V., reports the case. His attorney, John Hancock, of Oshkosh, Wisconsin, reports that English died in 1867.

CASE 151.—Private Philip Sweeney, Co. C, 3d New York, was wounded in the affair at Big Bethel, June 10, 1861, by a conoidal musket ball, which shattered the trochanters of the right femur. He was admitted to Hygeia Hospital, Fort Monroe, on June 13th, and was treated by Surgeon R. B. Bontecou, U. S. V., by moderate extension and dilatation of the wound by sponge tents in order to facilitate the extraction of primary sequestræ, of which many were removed. Suppuration and exfoliation persisted until March, 1862. In April there were two severe attacks of erysipelas, involving the entire limb, which greatly reduced the patient, but he quickly rallied, and in May was able to run a race on crutches with his wounded companions. He was transferred to Albany in June, 1862; but his name does not appear upon the hospital reports until March, 1863, when he was admitted to the Ladies' Home, in New York City, where a number of necrosed fragments were removed. On May 25, 1863,

[1] The remaining two cases were: 1. Serg't P. Casserleigh, A, 38th Illinois; Chickamauga, Sept. 19, 1863; conoidal ball entered behind the right great trochanter, passed inward and forward, fractured the apophysis, and, it was believed, injured the anterior crural nerve. It was considered possible, though not probable, that the joint was injured. He was discharged July 11, 1863. Examiner T. S. HENING, of Springfield, reported, in May, 1865, that a ball entered the right hip a little posterior to the great trochanter, passed into the hip and remained concealed in the tissues; limb one and a half inches shortened; motion and power of joint destroyed; and in November, 1866, that "the ball fractured the head and neck of the femur." The Springfield Examining Board reported, in August, 1874: "The limb is anchylosed in a semiflexed position and shortened four inches (*Circ.* 2, p. 94, CASE 201).—2. Pt. T. Purcell, F, 96th Pennsylvania, aged 22; Chancellorsville, May 3, 1863; a conoidal ball was stated to have produced a fracture of left femur in upper third, extending into hip joint. From a field hospital of the Sixth Corps he was transferred to Armory Square Hospital, Washington, and subsequently to Cuyler Hospital, Germantown, Pennsylvania. No mention was made at either of the latter hospitals of the involvement of the hip joint. At Mower Hospital, Philadelphia, the injury was noted as a "gunshot wound of upper third of left thigh with loss of four inches of bone." He was discharged July 8, 1865. Examiner J. T. CARPENTER, of Pottsville, reported, in September, 1873: "Entrance of wound about four inches below anterior superior spinous process of ilium, upper third of femur shattered; five inches shortening; no power; wasting of limb." (*Circ.* 2, p. 95, CASE 211.)

PLATE XXXIII. CONSOLIDATED GUNSHOT FRACTURE OF THE FEMUR.

Case of Private Philip Sweeny, 3rd New York Volunteers.

UNIVERSITY
OF
CALIFORNIA

he was discharged, being able to walk without a crutch and the limb being but slightly shortened. He soon afterwards engaged himself as a laborer at an iron foundry in Troy, New York, where he has since worked without intermission. On July 20, 1866, he was examined by Brevet-Colonel R. B. Bontecou, who found him in perfect health, the injured limb a trifle shortened, and the knee rather stiff, owing to the destruction of connective tissue about the extensor muscles of the thigh during the suppuration following the erysipelatous attacks, and, doubtless, the formation of adhesions. The knee joint was in good condition and had sufficient motion to allow a firm, good gait. In a letter dated November 23, 1868, Dr. Bontecou states that Sweeney is at work at Troy in a spike factory, and was able to sit at and run a machine. His knee was stiff from agglutination of the sheath of the extensor muscles of the thigh, otherwise the limb was useful. The Albany Examining Board, Drs. W. Craig, R. B. Bontecou, and C. H. Porter, record, in September, 1873: "Gunshot wound through the trochanters, fracturing the femur at the neck, leaving adhesions of all the muscles of the thigh from deep-seated sloughing, the result of erysipelas, making knee joint stiff in the extended posture." In September, 1875, Examining Surgeon R. B. Bontecou certified that "adhesions have rendered the knee immovable and the limb comparatively useless."

The parts injured were not particularly specified in ten instances of recovery after alleged shot fracture of the hip joint. Two are here detailed, and eight are briefly recorded in the foot-note.[1]

CASE 152.—"Private William C. Watson, Co. A, 4th Michigan, was struck in the left hip, at the battle of Malvern Hill, Virginia, July 1, 1862, by a conoidal musket ball. A fracture through the trochanteric region, with fissures probably extending to the joint, was reported. He was conveyed to Philadelphia and admitted into the Episcopal Hospital July 30th, transferred to Master Street Hospital on March 18th, and to South Street Hospital May 11th. The patient stated that for weeks his life was despaired of in consequence of the excessive suppuration which took place. Abscesses formed in the upper third of the thigh. Spiculæ of bone escaped at intervals for months from the wound and through the incisions made for the evacuation of the abscesses. On January 1, 1864, suppuration had nearly ceased. The limb was shortened several inches and there was much deformity. On March 24th he was admitted into Christian Street Hospital, where he was discharged from service May 5, 1864. He received a pension in September, 1868, and his disability was rated as total and permanent." Surgeon Paul B. Goddard, U. S. V., reports the case.

CASE 153.—Private Samuel Hensel, Co. H, 114th Pennsylvania, aged 31 years, was wounded at the battle of Chancellorsville, Virginia, May 3, 1863, by a musket ball, which entered the central portion of the left buttock. The soldier was conveyed by steamer to Washington, where, on May 8th, he was received into Armory Square Hospital. The wound was probed daily in search of the missile, which, at the end of two weeks, presented itself at the point of entrance and was extracted by the patient. He states that it was a round ball, but was flattened on one side, and had, in this surface, a clean cut filled with osseous matter. The treatment consisted of rest, position, and the application of cold-water dressings. On June 16th the patient was transferred to McKim's Mansion Hospital, in Baltimore. About the middle of July the nurse, while dressing the wound, discovered in it a foreign substance, which, upon removal, proved to be a portion of the haversack. The patient was soon afterwards transferred to Mower Hospital, Philadelphia. Early in September a spicula of bone, nearly two inches in length by one in width in its

[1] Cases of: Corp'l *J. J. Atkenson*, B, 1st Tennessee; wounded at Murfreesboro'; he was examined at Lauderdale, Mississippi, by Surgeons J. T. KENNEDY, D. W. WHIMPER, and H. YANDELL, P. A. C. S., who certified that he was suffering from a shot wound of left hip, fracturing bone, and wound of left hand, loss of use of two fingers; shortening and deformity of leg; retired to Confederate Invalid Corps (*Circ.* 2, p. 98, CASE 228).—2. Sergeant Albert G. Beebe, A, 85th Illinois, received, in the engagement near Perryville, Kentucky, October 8, 1862, a gunshot wound of the right hip, which was believed to involve a fracture of the joint. He was conveyed to hospital No. 7, in Perryville. He was discharged from service on February 15, 1863. His disability was rated as total. He is a pensioner. Examiner P. L. DIFFENBECHER, of Havana, Illinois, reported, May 29, 1876: "Wound of right leg; ball entered on the anterior aspect about three and a half inches below the groin, passed posteriorly and wounded trochanter major, superior aspect. Exit just posterior to the thigh joint; bones and muscles destroyed; also large cicatrix at point of ingress. Hip joint and leg affected by rheumatism aggravated by fatigue and exposure." The case is reported by Assistant Surgeon H. S. WOLFE, 81st Indiana.—3. Pt. *D. J. C. Campbell*, E, 3d Virginia, aged 36; Payne's Farm, November 27, 1863; shot wound left hip, ball entering near the trochanter major and lodging in the bone in the vicinity of the hip joint; retired from service, unfitted for any duty (*Circ.* 2, p. 98, CASE 229).—4. Corp'l H. Koch, F, 7th Missouri, aged 26; Chickamauga, September 20, 1863; conoidal ball splintered left femur above the shaft; discharged May 16, 1864. The St. Louis Examining Board reported, June 3, 1874: "Ball struck left thigh near trochanter major, shattering the bone" (*Circ.* 2, p. 100, CASE 245).—5. Pt. A. C. Woodall, G, 55th Pennsylvania, aged 17; Drury's Bluff, May 16, 1864; fracture left hip, involving the articulation; mustered out June 8, 1865, and pensioned (*Circ.* 2, p. 101, CASE 254).—6. Corp'l T. Gallagher, F, 165th New York, aged 30; Port Hudson, May 27, 1863; canister ball entered two and a half inches below great trochanter, passed backward and upward, and lodged three inches from place of entrance; projectile and several fragments of bone removed; discharged December 19, 1863, and pensioned. The New York Examining Board reported in October, 1872: "Ball struck outer aspect upper third left hip, fracturing or splintering the femur, and leaving two well-marked cicatrices; interferes with locomotion" (*Circ.* 2, p. 103, CASE 261).—7. Pt. *R. F. Carter*, B, 20th North Carolina, aged 21 years, was wounded at Gettysburg, July 1, 1863. His injury is entered on the register of the Gettysburg field hospital as a "gunshot wound of thigh and hip, with compound comminuted fracture of hip joint." On September 4th the patient was admitted to Camp Letterman, where Surgeon H. JANES, U. S. V., recorded: "A minié ball entered outer side of upper third of left thigh, lodging in the left groin and fracturing the femur in its course. When admitted the general health of the patient was good; leg a little swollen. On September 12th a small piece of bone was removed. October 10th, wound discharging freely, and fracture united with firm callus thrown out. November 8th, improving slowly. Patient can bear about one-tenth of the weight of his body on the limb. November 10th, transferred convalescent." Surgeon A. CHAPEL, U. S. V., reported that the man was admitted to West's Buildings Hospital, Baltimore, with "gunshot wound of left hip," and that he was paroled November 12, 1863.—8. Pt. H. Marlatt, G, 12th Illinois Cavalry, aged 19 years, was wounded at Upperville, June 21, 1863. He was admitted to a Cavalry field hospital, where Surgeon J. B. W. MITCHELL, 8th Pennsylvania Cavalry, noted: "Wound of left thigh by a pistol ball." Surgeon J. A. LIDELL, U. S. V., recorded his admission to Stanton Hospital, Washington, June 23d, with "wound of thigh," and his "return to duty on November 25, 1863." It is believed, however, that the man did not return to active field service, but was discharged from the hospital only to accompany his command when changing station from the Army of the Potomac to the Western armies. He was subsequently admitted to Camp Gamble, whence he was transferred to the Lawson Hospital, St. Louis, on February 15, 1864. Surgeon C. T. ALEXANDER, U. S. A., reported: "Gunshot wound of left thigh two inches below Poupart's ligament; ball passing downward, inward, and lodging. Wound healed when admitted. General condition good; uses crutches. Patient discharged from service February 27, 1864." Examiner C. HAY, of Warsaw, Illinois, certified, December 20, 1865: "A pistol ball entered the anterior upper third of the thigh, ranging towards the hip joint. The joint was in all probability injured, as he has not been able to move the limb upward since the casualty. The ball was lodged in or near the hip joint, upon the thigh bone, and still rests there. The bones composing the hip joint are now carious. The urinary organs are much deranged in their functions."

central portion, was extracted from the wound. Flaxseed poultices were applied. Subsequently ten other pieces, varying in size from one-fourth to one inch in length, were eliminated. The wound soon closed and the patient was able to get about on crutches. On September 24th he was transferred to McClellan Hospital, Philadelphia, where, on May 13, 1864, he was discharged from service "because of a compound fracture of the left thigh, upper third, incapacitating him for duty." Pension Examining Surgeon H. L. Hodge, of Philadelphia, reported, May 26, 1864: "On account of a gunshot fracture, probably of the os innominatum (left), there is a luxation of the head of the femur, which destroys the usefulness of the whole limb." On November 1, 1866, an apparatus was fitted to the disabled limb by Gemrig, of Philadelphia. Examining Surgeon James Cummiskey reported, April 6, 1867: "Was wounded by a ball entering the left buttock and lodging for a time in the left groin, fracturing the head of the femur badly, and resulting in shortening of the limb about three and a half inches and much wasting and feebleness of the limb. He is obliged to wear constantly an iron instrument to support the limb in walking. He suffers much pain at night." In a communication to this office dated Philadelphia, February 13, 1868, Mr. Hensel states that he is unable to walk without the use of the apparatus and a cane, but by the aid of these he can walk from a half to three-quarters of a mile, being obliged, however, to rest for two or three minutes once or twice by the way on account of pain and weakness in the limb. The Philadelphia Examining Board, Drs. H. E. Goodman, T. C. Rich, and James Collins, reported, September 4, 1875: "Has had a ball enter the left buttock, which was extracted from the wound of entrance. Has lost bone from head of femur, and the limb is nearly three and a half inches shortened. He has to wear a support with a high heel and sole shoe. Motion of hip joint limited to one-eighth degree. Spine curved from short limb."

Details of twenty-one of the reported cases of recovery after alleged shot fractures of the hip joint have been cited in the preceding pages, and the remaining thirty-four cases have been briefly alluded to in the foot-notes. The hip joint was undoubtedly involved in three of the fifty-five cases, viz: CASE 134, of Lieutenant Colonel H. C. Strong, 38th New York Volunteers; CASE 140, of Private *T. L. Lomax*, 30th Virginia; and CASE 143, of Private T. C. Garvin, 94th New York Volunteers. The latter died four years after the injury, but the opportunity was not improved of ascertaining unequivocally the precise nature of the injury to the articulation. Twelve cases[1] were probably examples of fractures of the trochanteric region or base of the neck of the femur, without the capsule. In thirteen cases the evidence is, to say the least, contradictory as to the seat of injury.[2] In five cases the evidence adduced is compatible with the supposition that the fractures were extracapsular.[3] In five other cases it is not proven that the articulation was directly injured.[4] The case of Private A. C. Woodall (*Note* 1, page 75) seems to have been a periarticular injury only. In the case of Private J. W. Galyean, 10th Indiana Volunteers (*Note* 1, page 70), the Pension Examining Surgeon, years after the injury, diagnosticated an injury to the joint. In the case of Private *J. Hughes*, 1st Alabama Cavalry, the evidence consists of an affidavit of an unknown surgeon before an "Association for the relief of maimed soldiers." In thirteen cases[5] the evidence is entirely insufficient to prove that the injuries were intracapsular shot fractures of the joint. In the case of Private W. C. Watson (CASE 152, page 75), 4th Michigan Volunteers, there remains room for argument, but the weight of evidence is adverse to the supposition that the hip was implicated.

Of the fifty-five cases of alleged recoveries after shot fractures of the hip joint treated without operative interference, eighteen were Confederate and thirty-seven Union soldiers. In the cases of the Confederate soldiers no information subsequent to the close of the war could be obtained. Of the thirty-seven Union soldiers four had died previous to 1880, one had not been heard from since 1866, and thirty-two were pensioners.

Carter* (*Note* 1, p. 75).

Shot Fractures at the Hip Joint unsuccessfully treated by Conservation.—Two hundred and forty-nine fatal cases of shot fractures of the bones of the hip joint treated by conservation were found on the various reports and hospital registers. In ten instances the acetabulum was recorded to have been fractured:

CASE 154.—Private G. W. Gentle, Co. E, 5th Ohio, was wounded at Antietam, September 17, 1862, and admitted to hospital No. 3, Frederick, October 1st. Assistant Surgeon J. H. Bill, U. S. A., reported: "The ball entered to the outside of the right pyramidalis muscle, passed outward and downward in front of the femur, and emerged at a spot in the integument corresponding to the insertion of the gluteus maximus. Nothing happened in this case, and no injury of a grave character was suspected. On the 23d of October, however, a hæmorrhage from both wounds took place. It was dark in color and readily checked by a tampon. Accordingly no action was taken, and, on the 25th, it recurred. It was now found that the thigh and hip were much swollen, an abscess present, seated in the track of the wound, and hæmorrhage evidently due to the ulceration of some vessel. In consultation with Surgeon H. S. Hewit, U. S. V., ligation of the external iliac was determined on. The man, however, refused the operation, and as the hæmorrhage externally had ceased, it was considered proper to wait. On October 27th, the hæmorrhage returned and the man wanted the artery tied. He was nearly moribund, and the case otherwise being unpromising still, the operation was undertaken by an incision parallel to but outside of the epigastric artery. The external iliac was found and tied without any difficulty. Previous to tying the ligature it was intended to lay open the abscess and search for the bleeding vessel, knowing that the circulation could be controlled. But at this stage of the operation the shock to the patient was so severe that it was necessary to finish all operative interference as soon as possible. The patient survived the operation only twenty-four hours. The autopsy showed the external iliac tied a quarter of an inch below the internal iliac, and the vein and peritoneum uninjured. A syringe was introduced into the femoral artery below the origin of the profunda and water thrown upward, but the bleeding vessel was not discovered, notwithstanding a careful dissection and prolonged search. The syringe was now introduced into the internal iliac and the water thrown downward, but with no better result. Failing thus to discover an ulcerated vessel on the cadaver, what likelihood would there have been of a successful search for the bleeding point on the living patient? The operation performed was unquestionably the proper one, as it checked the hæmorrhage, and was the only feasible method of doing this." The specimen represented in FIG. 26 was contributed by Assistant Surgeon J. H. Bill, and consists of "the right os innominatum and head of the femur. The joint was opened and the ischium at the lower border of the acetabulum contused by a musket ball which escaped through the glutæus maximus. The articular surfaces are eroded, but the implication of the joint was not suspected during life."—(*Cat. Surg. Sect.*, A. M. M., 1866, p. 235.)

FIG. 26.—Erosion of right os innominatum and head of femur after shot contusion. *Spec.* 758.

The remaining nine cases of fatal shot fracture of the acetabulum have been detailed; seven in *Circular* No. 2,[1] and two in the *Second Surgical Volume*.[2] The ten patients belonging to this group survived the injury 10, 11, 28, 31, 31, 32, 41, 46, 85, and 160 days respectively, and in two instances fragments of bone were removed.[3] Autopsies verifying the injury to the hip joint were made and recorded in nine of the ten cases, and in seven instances the specimens are preserved in the Army Medical Museum. *Specimen* 1285 (FIG. 27) is from the case of Private Joseph D——, Co. E, 129th Pennsylvania, aged 20 (*Circular* No. 2, S. G. O., 1869, p. 90, CASE 161). A conoidal ball had chipped the upper edge of the cotyloid cavity, causing slight exfoliation. The head of the femur and the acetabulum were deprived of periosteum. The injury to the bone was very trivial. The patient survived the injury thirty-one days. *Specimen* 694 (FIG. 28) is from the case of Private C. H.

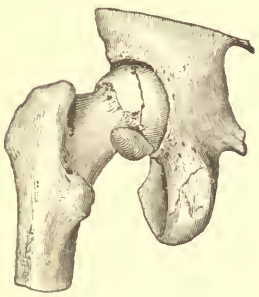

FIG. 27.—Bones of left hip joint with conoidal ball. *Spec.* 1285.

FIG. 28.—Carious bones of left hip joint. *Spec.* 694.

[1] *Circular* No. 2, p. 88: CASE 150, Pt. Wm. P. F——, 121st New York, *Spec.* 3525, A. M. M. CASE 160, p. 89, Pt. J. Brandon, 119th New York, *Spec.* 1843. CASE 161, p. 90, Pt. J. Donegan, 129th Pennsylvania, *Spec.* 1285. CASE 162, p. 90, Pt. T. McGowan, 121st New York. (See *Boston Med. and Surg. Jour.* 1863, Vol. 68, p. 439.) CASE 163, p. 90, Pt. C. H. Roberts, 1st New Jersey, *Spec.* 694. CASE 164, p. 90, Pt. Wm. H W——, G, 4th New York. CASE 257, p. 102, Capt. S. J. Alexander, B, 9th New Hampshire.

[2] *Med. and Surg. History of the War of the Rebellion*, Part II, Vol. II, p. 317: CASE 920, Pt. L. M. B——, I, 1st Massachusetts, *Spec.* 116; CASE 922, p. 318, Serg't T. A——, C, 119th New York, *Spec.* 1183.

[3] CASE of J. Brandon, F, 119th New York, *Circular* 2, p. 89, and CASE of Capt. S. J. Alexander, B, 9th New Hampshire, *Circular* 2, p. 102.

Roberts, Co. C, 1st New Jersey Volunteers, aged 19 (*Circular* No. 2, p. 90, CASE 163). The point of impact of the missile appears to have been at the lowest margin of the acetabulum, where a square inch of the ischium is necrosed and nearly separated.

The acetabulum and head of femur were recorded as having been fractured in thirty-two of the two hundred and forty-nine fatal cases of shot fractures of the hip joint. Autopsies are recorded in twenty instances, and in thirteen cases the specimens are preserved in the Army Medical Museum. *Specimen* 1908 (FIG. 29) is from the case of Private Joseph W——, K, 6th Maryland, aged 45 (*Circular* 2, p. 89, CASE 154). Death occurred in thirteen days. The lower margin of the acetabulum was chipped by the ball, which lodged in the summit of the head of the right femur, splitting it perpendicularly. *Specimen* 1248 (FIG. 30) is from the case of Corporal G. Greenwood, D, 13th Massachusetts (*Circular* 2, p. 113). The patient survived the injury thirteen days. The ball had shattered the head of the left femur and lodged in the pelvis.

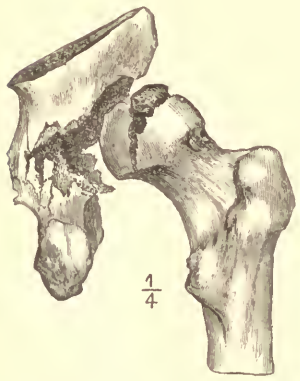

FIG. 29.—Bones of right hip joint. Ball impacted in head of femur. *Spec.* 1908.

FIG. 30.—Shattered head of the left femur. *Spec.* 1248.

Twenty-five of the cases have been published in detail in *Circular* No. 2,[1] and seven will here be recorded:

CASE 155.—Lieutenant C. F. Bailey, Co. D, 6th Vermont, aged 40 years, was wounded at Lee's Mills, April 16, 1862. Surgeon J. B. Brown, U. S. A., described the injury as a "wound of the groin." Surgeon R. B. Bontecou, U. S. V., reported: "He was admitted into the Hygeia Hospital, Fort Monroe, on April 22d, having been wounded by a round ball, which entered the left groin, passing between the femoral artery and anterior crural nerve, then entering the ramus of pubis and acetabulum, furrowing deeply the head of the femur, and passing through the acetabulum into the pelvis and resting by the left side of the rectum, about four inches above its termination. On admission, he was suffering much pain when the limb was moved. Wet applications and soothing treatment, with perfect rest, made him for some days comfortable. Fever of a low form occurred, and a yellow condition of the skin followed, with delirium, and death on May 1, 1862."

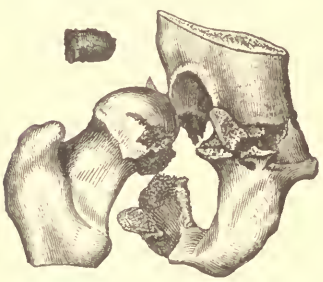

FIG. 31.—Grooved head of left femur, with portion of ilium and ischium. *Spec.* 3205.

CASE 156.—Private H. U. Cady, Co. K, 207th Pennsylvania, was wounded at Petersburg, April 2, 1865, by a conoidal ball. He was carried to the field hospital of the Ninth Corps, and remained there until April 5th, when he was taken on board the hospital steamer State of Maine. He died April 6th, during the trip to Alexandria, and was buried from the Third Division Hospital. Surgeon E. Bentley, U. S. V., who presented the injured upper extremity of the left femur, with portions of the ilium and ischium, to the Museum, furnishes the following description of the specimen, No. 3205, A. M. M., represented in the adjoining wood-cut (FIG. 31): "The bullet entered one inch above the symphisis and to the left of the median line, shattered the ramus of the pubes, left the obturator vessels untouched, passed through the acetabulum, grooving the head of the femur, and lodged in the loose tissue beyond. The ramus of the ischium appears to have been fractured by indirect violence. The bony fragments in the track of the ball are thoroughly necrosed."

CASE 157.—Private W. Hobbs, Co. C, 22d Indiana, was wounded at Mission Ridge, November 25, 1863, and entered the General Field Hospital at Chattanooga, December 4th. Acting Assistant Surgeon C. E. Ball reported: "He was wounded by a minié ball in the right inguinal region just above Poupart's ligament, the missile passing downward, toward and into the thigh apparently. The patient has double pneumonia. The bullet was in the wound, and the surgeons could not find it. The wound granulated well. Patient was in a recumbent position from the first. December 30th, has pneumonic symptoms still; wound granulating finely. Gangrene appeared in the wound January 3d. Bromine was applied and scissors used, also stimulants on poultice. Most of the wound granulated healthily again, but in spite of stimulants and iron, carefully given, the patient died January 23, 1864." Acting Assistant Surgeon G. E. Stubbs contributed the specimen (*Cat. Surg. Sect.*, 1866, p. 240, *Spec.* 2105), with the following account of the *autopsy*: "A sloughing wound, circular in form, and five and a half inches

[1] *Circular* No. 2, 1869: CASE 40, p. 70, Corp'l Wm. Francks, G, 24th Iowa (*Boston Med. and Surg. Jour.*, 1865, Vol. 72, p. 29), *Spec.* 3793. CASE 123, p. 85, Corp'l H. Achley, G, 2d New York H. CASE 275*a*, p. 113, Corporal G. Greenwood, D, 13th Mass., *Spec.* 1248.

in diameter, occupies the right inguinal region. The ball entered two inches from the anterior superior spinous process of the ilium, descended behind the cæcum, one and a half inches from the ramus of the pubis, passing through the bone and laying open the acetabulum, and fractured the tuberosity of the ischium, where it lodged. The head of the femur is denuded. The left lower extremity is much larger than the right and pits under the finger. The femoral glands are enlarged and prominent; the tissues about them infiltrated with serum. The right femoral vein is filled with a thrombus more or less attached to its wall, which may be detached without impairing the integrity of the lining of the vein. This thrombus consists in the main of greyish granular matter with portions of black coagulum, and extends to the junction of the iliac veins. A similar thrombus is found in the left iliac and femoral veins."[1] The specimen consists of the bones of the right hip joint. Much of the head of the femur is eroded, but a small circular portion of sound bone remains on the anterior aspect, surrounded by diseased tissue.

CASE 158.—Sergeant *M. B. Pendley,* Co. E, 6th North Carolina, aged 36 years, was wounded at Gettysburg, July 1, 1863. He remained at a field hospital until August 7th, when he was admitted to Camp Letterman. Acting Assistant Surgeon D. R. Good reported: "Gunshot wound of right hip joint. A minié ball passed through his pocket book, and entered the right iliac region one and a half inches inside of the anterior superior spinous process of the ilium, passed directly in the region of the joint and remained. The patient's general health has been very good, though he has suffered constant and severe pain from the injury and cannot endure the least motion of the limb. There has been comparatively very little inflammation and swelling of the surrounding parts. Simple dressings were applied and generous diet given. August 15th, for some time the limb has been flexed and drawn over and in front of the other leg. Administered chloroform and straightened the limb, and applied splint to keep the leg at rest. 22d, patient is comfortable so long as his limb is not moved, and is doing well. The general treatment is continued. 27th, general health not so good; limb more swollen. Administered tonics and some stimulants. 30th, has slight diarrhœa; opiates prescribed. September 4th, diarrhœa continues; ordered opiates and astringents. 10th, considerably better; treatment continued, with tonics and stimulants. 12th, diarrhœa still troublesome at times; his strength failing considerably. 16th, greatly prostrated; evidence of pyæmia. 17th, gangrene in the parts about the wound. Died September 17, 1863, at 10 o'clock P. M. *Post-mortem:* The ball had passed directly into the joint, slightly fracturing the head of the femur, and was buried in the acetabulum. The cavity was filled up with bone, and a large quantity of pus was found to have accumulated in and about the joint." The os innominatum and the upper portion of the femur were forwarded to the Museum by Acting Assistant Surgeon E. P. Townsend. The specimen shows a fracture extending through the acetabulum at the point of impact, which is necrosed, nearly the entire remainder of the articular surface being carious. A large portion of the head of the femur has been absorbed. Slight osseous deposits exist on the outer margin of the acetabulum.—(*Cat. Surg. Sect.* 1866, p. 242, *Spec.* 1942.)

FIG. 32.—Portion of right innominatum, with fracture of base of the acetabulum. *Spec.* 2488.

CASE 159.—Corporal *G. W. Stepps,* Co. C, 20th North Carolina, aged 20 years, was wounded at Spottsylvania, May 12, 1864, and entered Lincoln Hospital, Washington, on May 22d. Assistant Surgeon J. C. McKee, U. S. A., reported: "Gunshot wound of right groin, a minié ball entering half an inch below and exterior to the middle of Poupart's ligament, fracturing the head of the femur and the acetabulum, and escaping at the middle of the right nates. Death occurred on June 10, 1864." A portion of the os innominatum, represented in the wood-cut (FIG. 32), was contributed by Acting Assistant Surgeon H. M. Dean.—(*Cat. Surg. Sect.*, 1866, p. 236, *Spec.* 2488.)

CASE 160.—Private G. S. Turner, Co. I, 19th Maine, aged 18 years, was wounded at Gettysburg, July 3, 1863. He remained at the field hospital of the 2d division, Second Corps, until July 14th, when he was transferred to the Jarvis Hospital at Baltimore. Assistant Surgeon D. C. Peters, U. S. A., reported: "Gunshot wound of left hip joint. The anterior wound was about the middle, and above Poupart's ligament; the posterior near the tuberosity of the ischium. Blood oozed almost continuously from the wound in front, and twice alarming hæmorrhages occurred. He had a bad and colliquative diarrhœa, and was nearly pulseless when admitted. No reaction came on such as would warrant so formidable an operation as tying the common iliac. Constant pressure by compresses was made. Death occurred on July 19, 1863. The *post-mortem* revealed an immense traumatic aneurism and abscess about the hip joint. The femoral artery was lacerated and a mass of decomposed tissue. The musket ball struck the acetabulum and the head of the femur, gouging them, and subsequent disorganization denuded them of periosteum. The structures around were in an advanced state of decomposition, and it is a wonder the patient lived so long as he did."

CASE 161.—Private *H. West,* Co. A, 3d North Carolina, aged 20 years, was wounded at Antietam, September 17, 1862, and admitted to the hospital at Locust Springs, November 22d, where Surgeon T. H. Squire, 89th New York, recorded: "The patient came to this hospital from Sharpsburg. He was wounded by a musket ball, which entered the right gluteal region midway between the summit of the trochanter and the crest of the ilium and lodged in some unknown part of the body. There is a general fullness, and some hardness and redness in the groin and region of Poupart's ligament, and possibly the ball may be in that neighborhood. The patient's general health is tolerable." On January 19th he was transferred to the Smoketown Hospital, and, on May 11th, to hospital No. 1, at Frederick. Assistant Surgeon R. F. Weir, U. S. A., reported that he died, July 6, 1863, of "gunshot wound of hip, involving the joint." Acting Assistant Surgeon G. M. Paulin contributed the os innominatum and the head of the femur of this case to the Museum. The specimen shows that a round bullet entered obliquely from the right front, fractured the superior portion of the head of the femur, perforated the acetabulum, and lodged in the body of the ilium without derangement to its own form. One half of the head of the femur has been absorbed; the anterior superior third of the acetabulum is carious and partially detached; near the fundus of the acetabulum ulceration has perforated the bone, and the bullet communicates with the head of the femur by a carious channel. The missile is encircled with a wall of new bone thrown out from the irritation of its presence; there is also considerable deposit of callus on the ilio-pubic region, which caused, during life, a prominence in the region of Poupart's ligament. The dorsum ilii and the posterior surface of the body of the ischium show evidence of periosteal inflammation.—(*Cat. Surg. Sect.*, 1866, p. 242, *Spec.* 3865.)

[1] LIDELL (J. A.), in *Memoirs of U. S. Sanitary Commission*, New York, 1870, Surgical Vol. I, p. 551, describes the thrombosis with pyæmia.

In twenty of the two hundred and forty-nine cases with fatal terminations after shot fractures of the hip joint, the acetabulum with the head and neck or trochanters and shaft were injured. *Post-mortem* examinations are recorded in seventeen instances, and the Army Medical Museum possesses eight specimens belonging to cases of this group. Fifteen of the cases have been detailed in *Circular* No. 2;[1] five will here be given in full:

CASE 162.—Private R. Snyder, Co. K, 13th Illinois, was wounded at Ringgold, November 27, 1863, and admitted to the general field hospital at Chattanooga on the following day, where Surgeon J. Perkins, U. S. V., recorded: "Gunshot wound of left hip." Two weeks afterwards the patient was transferred to Nashville, where he was admitted to hospital No. 19. Surgeon W. Foye, U. S. V., described the case as follows: "Admitted December 15th, with gunshot fracture of left femur; the ball, which proved to be a large minié, entered about one and a half inches to the left and below the anterior superior spinous process of the ilium and had not emerged. The wound was quite small, and discharging a small quantity of pus of a somewhat serous character; pulse weak, about 90, and feverish. Simple dressings, supporting diet, and tonics were ordered. The following day the discharge was of a fair character and the patient feeling better. As the ball had been searched for twice without success, it was deemed best not to disturb the parts unless rendered necessary. On December 18th the discharge was very profuse, amounting to nearly a quart of sanious and watery matter of very fetid odor. The wound was laid open and probed; the path of the ball was apparently along the inner side of the femur, yet that was not sufficiently large for so profuse a discharge; but no other path or sac was found, though the neck of the femur was ascertained to be much comminuted. He seemed more feverish during the day, and had some dyspnœa and cough; pulse 100. Treatment continued. On December 19th the patient was evidently failing; pulse 110, and weak; discharge more profuse and of the same character. On the 20th the symptoms were all aggravated. He died on December 21, 1863. The *autopsy* showed that the ball had entered at the point above described and struck the neck of the femur, completely severing it and partially dividing the head, comminuting the lower part of the acetabulum and passing through the ilium, and lay about an inch within the cavity of the pelvis. It was surrounded by coagula, but had done no injury to the intestines. A smaller track was made along the inner side of the femur. No piece of ball was found in this path. Intestines normal; liver and spleen considerably enlarged and friable. The right lobe of the lungs was inflamed but not hepatized. There were no abscesses in any of these organs. The heart and other organs were in good condition." The bones of the injured hip joint were contributed to the Museum by Surgeon Foye. (*Cat. Surg. Sect.*, 1865, p. 242, *Spec.* 2174.) The specimen (FIG. 33) shows the borders of the bony wound to be necrosed.

FIG. 33.—Bones of the left hip joint. Head of femur shattered at junction with the neck. *Spec.* 2174.

CASE 163.—Private A. Kibble, Co. C, 81st New York, aged 26 years, was struck in the right hip by a cannon ball during the engagement near Petersburg, May 19, 1864. He was admitted to the General Hospital at Fort Monroe, where he died May 25, 1864. Assistant Surgeon E. McClellan, U. S. A., reported: "Both the os innominatum and the femur were fractured and much comminuted, all the bones entering into the formation of the joint being literally crushed by a solid shot."

CASE 164.—Private C. Cook, Co. F, 18th Illinois, aged 41 years, is reported by Surgeon J. Simons, U. S. A., as having died of "gunshot wound," at the General Hospital at Cairo, December 4, 1861. In a report of surgical cases transmitted in April, 1873, by Dr. J. H. Brinton, late Surgeon U. S. V., the injury is described as follows: "Cook was shot while drunk, by a guard, on December 1st, at 6 o'clock P. M., at a distance of thirty yards. The missile, a Maynard rifle ball, entered in left side on a line with the crest of the ilium, passed outward and downward, and emerged at the posterior part of the left buttock. I saw him shortly after the injury in a state of collapse from the shock, pulse 132, feeble and thready; skin cold, white and waxy; cold sweat on forehead; constant venous dribbling from both openings. December 2d, no discharge from his bowels since being shot; passes his urine; is in a very prostrate condition; has reacted but very little. Stimulants have been freely given. A few spiculæ were extracted from near the exit orifice. December 3d, patient failing fast; pulse feeble and not to be counted; urine scanty; pulse imperceptible; skin hot and dry; urine voided involuntarily; bowels have not been moved. Died at 9 o'clock A. M., on December 4th. *Post-mortem* two hours after death: Tissues around wound of entrance dissected up all around for an inch. Ball had passed obliquely outward and downward, grazing the anterior lip of acetabulum, passing through head of femur, splintering it and the neck, and destroying the posterior lip of the acetabulum. The extravasation of blood had passed down from wound of entrance, along and superficial to tendon of external oblique muscle as far as the external ring, then up the inguinal canal through the internal ring, and was collected in a clot of three or four drachms around the internal ring. Both rings were enlarged; a hernia came down after injury, which was reduced; no wound of the peritoneum. The tissues were loosened around the wound of entrance in a circumference of one and a half inches." In addition to this case Dr. Brinton makes the following remarks: "This loosening of tissues around the entrance wound of a conoidal ball I have since observed in hundreds of cases. It is undoubtedly peculiar. Usually the point of a finger passed through the wound can be hooked under the skin and swept around without encountering resistance sufficient to impede its motion. The earlier the wound is examined the more perfectly will this phenomenon be observed, as clots, etc., afterwards block up the disintegrated zone."

[1] *Circular* No. 2, 1869: CASE 80, p. 77, Pt. Wm. O. M——, C, 24th Iowa, *Spec.* 3792. CASE 124, p. 85, Pt. F. Baker, I, 3d Vermont. CASE 129, p. 85, Pt. D. Combe, K, 209th Penn. CASE 130, p. 86, Pt. Ch. Cushion, 179th New York. CASE 132, p. 86, Pt. S. N. E——, G, 40th Indiana, *Spec.* 3390. CASE 137, p. 86, Corp'l J. T. Glancy, F, 2d Rhode Island. CASE 139, p. 86, Pt. *D. M. Johnson*, I, 13th Alabama. CASE 140, p. 86, Pt. *George L*——, D, 5th Louisiana, *Spec.* 3946. CASE 142, p. 87, Pt. L. L. Lowe, E, 101st Ohio. CASE 143, p. 87, Pt. Peter M——, A, 28th Mass., *Spec.* 4227. CASE 145, p. 87, Serg't Charles G. P——, G, 13th Penn., *Spec.* 3632. CASE 151, p. 88, Pt. G. F. Tilton, E, 1st Mass. Cav. CASE 153, p. 89, Serg't William Whitney, K, 147th New York. CASE 158, p. 89, Pt. *A. Wormack*, G, 48th North Carolina. CASE 159, p. 89, Corp'l M. F. Yoder, G, 51st Ohio.

CASE 165.—Private *M. C. Lesueur*, Co. C, 3d Georgia, was wounded at Liberty Gap, June 25, 1863, and admitted to hospital at Murfreesboro' two days afterwards. Assistant Surgeon W. P. McCullogh, 78th Pennsylvania, recorded: "Gunshot wound of right thigh, ball entering trochanter and passing inward and backward. The missile was traced through the trochanter but could not be found." The treatment is noted as having consisted of water dressings, morphia, stimulants, and tonics, and, in the latter stage, astringents were given to control the diarrhœa. On July 8th, the wound was suppurating freely and the leg was bandaged. On August 1st, an incision was made and some spiculæ of bone removed, a discharge of pus to the amount of eight ounces taking place. On August 9th the patient was slowly sinking, and, on the 16th, he was failing rapidly. He died August 19, 1863. An *autopsy* was held eight hours after death, and is recorded as follows: "The ball entered the trochanter major, passing through it and entering the capsule of the joint, carrying away a portion of the head of the femur and ligamentum teres, and posterior portion of acetabulum, and was found lodging in the lower attachment of the latissimus dorsi. A large abscess was found in the locality of the iliacus internus and psoas muscle, the cartilage and bone of the joint much absorbed, and the cancellated structure infiltrated with sanious pus."

FIG. 34.—Bones of the left hip joint. *Spec.* 1659.

CASE 166.—Private M. J. H. Perkins, Co. K, 6th Maine, aged 21 years, was wounded at Chancellorsville, May 3, 1863. He was admitted to Judiciary Square Hospital, Washington, May 7th, and transferred to McDougall Hospital, Fort Schuyler, New York Harbor, one month afterwards. Assistant Surgeon R. Bartholow, U. S. A., contributed the specimen (*Cat. Surg. Sect.*, 1866, p. 235, *Spec.* 1659), represented in the adjacent wood-cut (FIG. 34), with the following description: "A minié ball entered the left hip, striking the neck of the femur within the capsule, passing through the obturator foramen and between the rectum and urethra without injuring either, and escaped behind the ramus of the right ischium. Inflammation of the prostate gland, and priapism set in. The patient died June 13, 1863." The specimen consists of the bones of the hip joint, the articular surfaces being entirely eroded.

Of the two hundred and forty-nine fatal cases of shot fractures of the hip joint, twenty-three were limited to the head of the femur alone. In ten instances autopsies were performed, and six specimens are preserved in the Army Medical Museum. Two are represented in the adjoining wood-cuts. *Specimen* 1968 (FIG. 35) was obtained from Corporal *J. E. G*——, Co. I, 2d South Carolina, aged 22 years, wounded at Gettysburg, July 2, 1863. The head of the femur was slightly fractured; the acetabulum became carious, and the patient died from exhaustion on Oct. 12, 1863, one hundred and two days after the injury (*Circular* 2, page 71, CASE 42). *Specimen* 2198 (FIG. 36) shows the bone of the left hip joint. The head of the femur is carious and the articular surface has been roughened by ulceration. The history of the case from which the specimen was obtained is given in detail in *Circular* No. 2, page 82, CASE 104. Besides the specimen cases here referred to, fifteen have been detailed in *Circular* No. 2.[2] The histories of the remaining six cases will here be recorded:

FIG. 35.—Bones of the right hip joint. Head of femur nearly absorbed. *Spec.* 1968.

FIG. 36.—Bones of the left hip joint with carious head of femur. *Spec.* 2198.

CASE 167.—Private I. Conduri, Co. D, 1st Michigan Cavalry, aged 22 years, was shot in the right thigh while on scout near Culpeper, April 24, 1864. He was admitted to the Third Division Hospital, Alexandria, whence Surgeon E. Bentley,

[1] MOSES (J.), *Surgical Notes*, etc., in *Am. Jour. Med. Sci.*, 1864, Vol. XLVII, p. 337.

CASE 111, p. 83, Sergeant H. Stulter, D, 53d Pennsylvania. CASE 113, p. 83, Pt. Peter L. Swank, I, 38th Ohio. CASE 115, p. 83, Serg't V. Tidball, H, 122d Ohio. CASE 246, p. 100, Pt. *F. Kreegor*, B, 18th Georgia. CASE 251, p. 101, Pt. S. Sellers, I, 168th Ohio.

U. S. V., reported: "The treatment consisted of water dressings, tonics, stimulants, and extra diet. The patient died June 11, 1864. The *post-mortem* showed that the ball entered the thigh at its middle third, on its anterior aspect, passed upward and entirely through the articulation of the hip joint, and lodged in the body of the sacrum."

CASE 168.—Sergeant *M. D. Ensor*, Co. C, 20th North Carolina, aged 26 years, was wounded and captured at Winchester, September 19, 1864. On the following day he was admitted to the Prisoner's Hospital, where Assistant Surgeon H. B. Noble, 2d Ohio Cavalry, recorded: "Gunshot compound comminuted fracture of upper third of right femur; Desault's long splints applied and simple dressings." Surgeon A. Chapel, U. S. V., reported the man's admission to West's Buildings Hospital, Baltimore, January 19, 1865, from Winchester, with "gunshot wound, the ball entering near the trochanter of the thigh bone, producing fracture." On May 9th the prisoner was transferred to Fort McHenry. Surgeon W. Hays, U. S. V., in charge of the Post Hospital at the latter place, reported that the man "died from exhaustion, resulting from excessive suppuration caused by gunshot fracture of head of femur, June 3, 1865."

CASE 169.—Private *A. Fann*, Co. C, 18th Tennessee, was wounded at Stone's River, December 31, 1862, and admitted to hospital No. 4, Nashville, January 27th. Acting Assistant Surgeon F. L. Tower reported: "Gunshot fracture of head of left femur and wound of abdomen. Death on January 31, 1863."

CASE 170.—Private S. Irwin, Co. C, 10th Massachusetts, aged 25 years, was wounded at the Po River, May 12, 1864. Surgeon S. F. Chapin, 139th Pennsylvania, noted his admission to the field hospital of the 2d division, Sixth Corps, with "gunshot wound of left thigh." On May 24th the wounded man was admitted to Prince Street Hospital, Alexandria, whence Acting Assistant Surgeon J. Cass contributed the specimen (*Cat. Surg. Sect.*, 1866, p. 234, *Spec.* 2374) and the following report: "The patient suffered considerable pain, had chills, was very uneasy and anxious, had no appetite, hiccough, and great prostration, and died May 28, 1864. At the *autopsy* the left groin was found considerably discolored, and, on examination, it was discovered that the wound commenced just below the middle of Poupart's ligament, extending downward and inward, and terminating at the ischium, which was fractured. The ball was found near that bone, between it and the head of the femur, which was also fractured. The ligaments of the hip joint, the soft parts in the groin, and the upper part of the thigh were gangrenous." The specimen (FIG. 37) consists of a portion of the left ischium and the upper extremity of the femur. There is a partial fracture of the head of the femur at its articular border and of the ischium by a battered round ball, which is attached.

FIG. 37.—Portion of left ischium and upper part of femur. *Spec.* 2374.

CASE 171.—Lieutenant J. Snyder, Co. K, 83d Ohio, aged 33 years, was wounded at Fort Blakely, April 9, 1865, and admitted to the St. Louis Hospital, New Orleans, five days afterwards. Surgeon A. McMahon, U. S. V., reported: "Gunshot wound of right thigh and nates, fracturing the ischium and the femur at its neck. Death resulted from peritonitis following inflammation of the pelvic fascia."

CASE 172.—Private A. Underhill, Co. C, 10th New York, was wounded at the Wilderness, May 6, 1864, and admitted to the field hospital of the 2d division, Second Corps. Surgeon J. F. Dyer, 19th Massachusetts, reported: "Gunshot fracture of head of femur." The wounded man was conveyed to Fredericksburg, where he died May 15, 1864.

In seventeen of the fatal cases after shot fracture of the hip joint treated by conservation the head and neck, or head, neck, and trochanters of the femur were injured. Full details of fifteen of the cases, with illustrations of eight specimens, have been given in *Circular* 2.[1] Meager details of two cases will here be added:

CASE 173.—Private H. Peters, Co. D, 18th U. S. Infantry, was wounded at Chickamauga, September 19, 1863. He was admitted to hospital at Chattanooga ten days after the injury. Surgeon J. S. Woods, 99th Ohio, reported: "Fracture of head and neck of right femur. Patient in bad condition; several pieces of bone were removed." The man died October 11, 1863. On the list of casualties at the battle of Chickamauga, furnished by Surgeon G. Perin, U. S. A., Medical Director of the Army of the Cumberland, the injury in this case is reported as a "wound of privates and right side."

CASE 174.—Private F. Benda, Co. F, 26th Wisconsin, aged 19 years, was wounded at Gettysburg, July 1, 1863, and admitted to the field hospital of the 2d division, Eleventh Corps, where Surgeon W. H. Thorn, U. S. V., recorded: "Gunshot wound of left hip; ball extracted." On August 6th the patient entered Camp Letterman Hospital, where Surgeon H. Janes, U. S. V., recorded: "The patient suffers from a compound comminuted fracture of femur. The ball entered from the outside of the hip, crushing the bone from the trochanter major upward, then passing obliquely upward entered the pelvis near the sacrum. No history of this case could be procured previous to his admission to this hospital. August 12th, the patient suffers from diarrhœa and hectic fever and is sinking rapidly. He died from exhaustion, August 20, 1863. Treatment: Exhibition of tonics, stimulants, and anodynes."

---

[1] *Circular* 2, 1869: CASE 6, p. 66, Pt. J. Barnes, B, 52d Indiana. CASE 8, p. 56, Pt. Anthony B——, C, 12th Illinois, *Spec.* 466. CASE 10, p. 66, Pt. Charles R. B——, E, 16th Maine, *Spec.* 598. CASE 17, p. 67, Pt. W. C——, 159th New York, *Spec.* 1291. CASE 21, p. 68, Pt. D. Curran, A, 5th Kentucky. CASE 45, p. 72, Major John J. G——, G, 47th Pennsylvania, *Spec.* 3789. CASE 52, p. 73, Corporal Benjamin H——, C, 9th West Virginia, *Spec.* 4267. CASE 76, p. 77, Corporal Donald McD——, E, 12th New York Cav., *Spec.* 2170. CASE 89, p. 79, Serg't S. W. N——, E, 15th New Jersey, *Spec.* 1253. CASE 91, p. 80, Captain Samuel Oakley, 77th New York. CASE 102, p. 82, Pt. *C. Saunders*, C, 6th Louisiana Cavalry. CASE 106, p. 82, Pt. *G. H. S*——, H, 2d North Carolina, *Spec.* 1967. CASE 118, p. 84, Pt. R. A. Walker, E, 2d New Hampshire. CASE 275, p. 113, Pt. A. Swanson, H, 3d Michigan. In the case reported by Dr. J. DICKSON BRUNS (*Circ.* 2, S. G. O., 1869, p. 57), a first attempt to remedy the injury by an operation was suspended, as the hæmorrhage was very great. Some ten days or two weeks after, an excision of the head of the femur was attempted, as an examination had shown that the neck was extensively split. After the primary incisions had been made, and several fragments of the neck had been removed, the operation was discontinued, as it became apparent that death was inevitable.

Seventy instances are recorded, among the two hundred and forty-nine fatal cases of shot fractures of the hip joint treated by conservation, in which the neck of the femur was stated to have been fractured. Fifty-six of the cases have been recorded in *Circular* 2;[1] fourteen will be recorded here. Autopsies were made in twenty-one of the cases, and eleven specimens are preserved in the Army Medical Museum. A specimen belonging to this group, represented in the adjoining wood-cut (FIG. 38), was received without history. It consists of the upper fourth of the femur, with a fragment of a round ball embedded in the neck within the capsule. There is no evidence of chronic articular disease. The specimen is a fair illustration of injury to bone by round balls at low velocities. A similar specimen is represented in FIG. 39, showing a round ball embedded in the neck of the femur near the trochanter major, fracturing the neck within the capsule. The history of this case has been detailed in *Circular* No. 2, p. 81, CASE 98.

FIG. 38.—Shot fracture of neck of left femur. *Spec.* 3951.

FIG. 39.—Shot fracture of neck of right femur. *Spec.* 1661.

CASE 175.—Private *J. Boaz*, Co. A, 1st Confederate States Cavalry, was wounded at Stone's River, December 31, 1862. He was admitted into No. 19 Hospital, Nashville, January 20, 1863. Surgeon J. Shrady, 2d East Tennessee, noted: "Gunshot compound fracture of the neck of the right femur." He died February 4, 1863.

CASE 176.—Private J. W. Connor, Co. D, 81st Pennsylvania, was wounded at Fredericksburg, December 13, 1862. Surgeon J. E. McDonald, 79th New York, recorded his entrance into the field hospital of the 1st division, Ninth Corps, with "Gunshot wound of left thigh." Surgeon J. A. Lidell, U. S. V., contributed the specimen represented in the adjoining wood-cut (FIG. 40) (*Cat. Surg. Sect.*, 1866, p. 243, *Spec.* 622), and reported the following history: "Admitted to Stanton Hospital, Washington, December 26th, with gunshot fracture of left thigh in upper third; ball not extracted. The injured limb was a good deal swelled; pus flowing from the wound. Exploration did not discover the ball; thigh found fractured high up; amount of displacement small. The case did pretty well till December 31st, when symptoms of pyæmia showed themselves. He grew rapidly worse, and died January 2, 1863. The necropsy showed inflammation of the femoral vein, pus in the femoral and iliac veins, a comminuted fracture in the neighborhood of the trochanters, and the ball firmly impacted in the ischium." The specimen consists of the bones of the hip joint with a portion of the ligaments, the head of the femur being dislocated. The track of the ball is necrosed, but a small quantity of callus has been thrown out on the anterior surface of the femur.

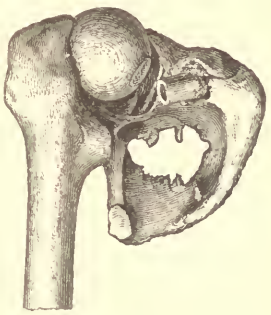

FIG. 40.—Bones of the left hip joint with dislocation of head of femur. *Spec.* 622.

CASE 177.—Private A. E. Davis, Co. E, 1st Maine Cavalry, aged 22 years, was wounded during the Richmond raid, March 2, 1864, and admitted to the General Hospital at Fort Monroe five days afterwards. Assistant Surgeon E. McClellan, U. S. A., reported: "Gunshot wound of right hip. The patient was admitted in good condition; wound healthy. Pyæmia was developed on March 12th, and death occurred within twenty-four hours. The *autopsy* discovered that the ball had pierced the neck of the femur. There were symptoms of inflammation of the femoral vein; six ounces of dark bloody fluid in left

[1] *Circular* 2, S. G. O., 1869: CASE 1, p. 65, Pt. A. Baker, 5th Maine Battery. CASE 3, p. 65, Pt. J. Balines, C, 26th Wisconsin. CASE 4, p. 66, Pt. W. Bancho, H, 3d New Hampshire. Schmidt, H, 8th Kansas. CASE 276, p. 114, Serg't C. Scott, A, 1st New Jersey Cavalry, *Spec.* 3520.

thorax, with an oily fluid floating on it; two ounces of light colored bloody fluid in pericardium; an oily substance collected on the blood from all parts of the body. Liver engorged and soft. No formation of pus discovered."

CASE 178.—Private G. W. Fierstine, Co. K, 93d Pennsylvania, was wounded at Fair Oaks, June 1, 1862, and admitted to the Fifth and Buttonwood Streets Hospital, Philadelphia, six days afterwards. Acting Assistant Surgeon A. C. Bournonville reported: "Fracture of neck of femur, tuberosity of ischium shot off and pelvic bones shattered; no wound of bladder or rectum. Prognosis fatal. Patient was most comfortable by having the limb elevated and supported by pillows. He died June 12, 1862."

CASE 179.—Private J. M. Hayse, Co. K, 14th Kansas Cavalry, was accidentally wounded May 19, 1864, and admitted to hospital at Fort Smith. Surgeon C. E. Swasey, U. S. V., reported: "Gunshot wound of left thigh into abdomen, with fracture of neck of femur. Death resulted, from perforation of the bowels, on May 20, 1864."

CASE 180.—Private F. M. Hayes, Co. A, 211th Pennsylvania, aged 21 years, was wounded at Fort Steadman, March 25, 1865. He was admitted to the field hospital of the 3d division, Ninth Corps, where Surgeon M. F. Bowes, 211th Pennsylvania, recorded: "Wound of right hip by conoidal ball." Two days afterwards the man was moved to the Depot Hospital at City Point, and ten days later he was conveyed on a hospital steamer to Alexandria, where he entered the Third Division Hospital. Surgeon E. Bentley, U. S. V., reported: "Gunshot fracture of right hip. Light cold-water dressings and a bandage were applied over the thigh to facilitate the discharge of pus from the wound. The limb was retained in position by means of an inclined plane, with slight extension and counter-extension. Alcoholic stimulants and nourishing diet were freely administered. He died April 14, 1865. *Autopsy* thirteen hours after death: Tissues of thigh very much disorganized by the extent of suppuration, involving the entire limb. The femur was fractured at the neck. The ball had passed under the pubis and was found in the pelvis, external to the peritoneum."

CASE 181.—Private C. Hambrecht, Co. E, 4th New Jersey, was wounded at South Mountain, September 14, 1862, and admitted to the field hospital at Burkettsville. Assistant Surgeon H. A. DuBois, U. S. A., reported: "Gunshot wound through os pubis and neck of femur. Secondary hæmorrhage occurred on October 18th. A ligature was applied to the external iliac and the femoral arteries. But little blood was lost, the surgeon being in the ward at the time the hæmorrhage commenced. The operation was difficult, it being necessary in order to stop the hæmorrhage to compress the artery on each side and close to the wound, which was directly below Poupart's ligament. The patient rallied after the operation and was able to read a letter, but died six hours after."

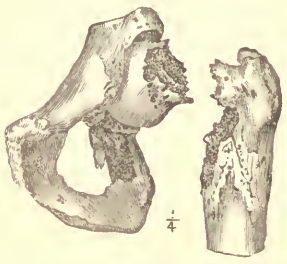

FIG. 41.—Bones of left hip joint. Neck of femur shattered. *Spec.* 2398.

CASE 182.—Private W. J. Little, Co. I, 57th Pennsylvania, aged 22 years, was wounded at the Wilderness, May 5, 1864, and admitted to the field hospital of the 3d division, Second Corps. Surgeon O. Evarts, 20th Indiana, noted: "Gunshot wound of left hip." Surgeon D. W. Bliss, U. S. V., forwarded the specimen (*Cat. Surg. Sect.*, 1866, p. 241, *Spec.* 2398) and reported: "The patient entered Armory Square Hospital, Washington, May 28th. He was wounded by a conoidal ball, which entered the right gluteal region on a line with the coccyx, two inches above the anus, passing under the fascia in a direct line and through the ramus of the ischium, comminuting the left femur at its neck, and making its exit over the great trochanter. Powerful stimulants were given but with no effect. The patient died from the effects of the injury, May 30, 1864." The specimen shown in the wood-cut (FIG. 41) consists of the bones of the left hip joint, and shows the head of the femur, with the exception of a slight fissure on its articular surface, to be uninjured.

CASE 183.—Private J. McAlpine, Co. C, 7th Illinois, was wounded at Allatoona, October, 5, 1864. Surgeon J. R. Zearing, 57th Illinois, reported his admission to the field hospital of the 4th division, Fifteenth Corps, with "gunshot fracture of neck of femur," and his death on October 8, 1864.

CASE 184.—Musician F. McNeil, Co. B, 17th Illinois, was wounded at Shiloh, April 6, 1862, and admitted to hospital at Quincy twelve days afterwards. Surgeon R. Niccolls, U. S. V., reported: "Compound comminuted fracture of right femur at the neck and transverse fracture of left femur at the middle third. Dr. Buck's weight and pulley were employed. Death took place on April 27, 1862. At the *post-mortem* a minié ball, split longitudinally, was removed from the neck of the femur."

CASE 185.—Private U. T. Palmer, Co. I, 1st Maine, aged 33 years, was wounded at Cedar Creek, October 19, 1864, and admitted to the field hospital of the 2d division, Sixth Corps. Surgeon S. F. Chapin, 139th Pennsylvania, noted: "Gunshot fracture of left thigh." On October 27th the wounded man was admitted to Camden Street Hospital, Baltimore, whence Surgeon Z. E. Bliss, U. S. V., reported as follows: "Gunshot wound of left gluteal region, with fracture of neck of femur. Smith's anterior splints were applied, and quinine and carbonate of ammonia, etc., were resorted to, but unsuccessfully. The patient died of pyæmia, November 3, 1864. At the *post-mortem* pus was found in the synovial cavities near the hip joint."

CASE 186.—Sergeant W. Peabody, Co. C, 10th Vermont, aged 22 years, was wounded at Monocacy, July 9, 1864, and admitted to hospital at Frederick the following day. Assistant Surgeon R. F. Weir, U. S. A., reported: "Gunshot fracture of neck of left femur and flesh wound of thigh and scrotum. Ball removed July 11th. Tonics, opiates, and stimulants administered; Buck's extension apparatus applied. Death, from exhaustion, July 23, 1864."

CASE 187.—Private *J. H. Smith*, Co. H, 12th South Carolina, appears on a report from the Confederate Hospital at Charlottesville as having died June 1, 1864, of "gunshot wound of left thigh; missile found in neck of femur."

CASE 188.—Captain *R. Ward*, Co. B, 33d Alabama, was wounded at Perryville, October 8, 1862. On a report of "Sick and Wounded Confederates left behind after the battle," signed by Surgeon C. Longenbecker, 13th Louisiana Regiment, C. S. A., his injury is described as a "gunshot fracture of left thigh through neck of femur into the joint and os ischii, ball in pelvis," and his death is stated to have occurred on October 27, 1862.

Of the two hundred and forty-nine fatal shot wounds of the hip joint treated by conservation fifty were instances of shot injuries of the neck and trochanters, or neck, trochanters and shaft of femur. Autopsies were performed in thirty-two instances, and twenty-five specimens are deposited in the Army Medical Museum. All of the cases have been reported in *Circular* No. 2,[1] and only a few of those in which interesting specimens are preserved will be here briefly noticed.

CASE 189.—Private C. H. Elliott, Co. D, 61st Pennsylvania, was wounded at the battle of Fair Oaks, May 31, 1862, by several musket balls. One entered near the right acromion process and emerged at the insertion of the deltoid muscle; another at the gluteal fold; a third passed through the upper part of the thigh; a finger was also shot away. He was conveyed to Portsmouth, and on June 5th was admitted into the Balfour General Hospital. A fracture of the head of the humerus was recognized, and, on June 14th, Assistant Surgeon Sheldon, U. S. A., excised the head and about three inches of the shaft (see *Second Surgical Volume*, p. 586, CASE 23). Abscesses formed in the left thigh. Pyæmia supervened, and the patient died on June 17, 1862. At the autopsy the upper third of the femur was found to be shattered. There was a collection of pus near the wound in the hip. Assistant Surgeon H. L. Sheldon, U. S. A., reports the case. The specimen, 4930, represented in FIG. 42, was contributed by Assistant Surgeon W. Thomson, U. S. A.—(*Circular* No. 2, p. 69, CASE 31.)

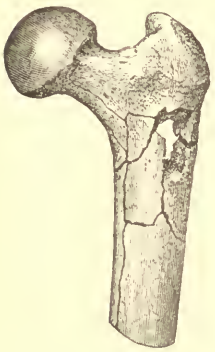

FIG. 42.–Comminuted fracture of upper third of left femur, with fissure extending into the neck. *Spec.* 4930.

FIG. 43.—Upper portion of left femur, with fragments of bone removed after shot fracture of the neck. *Specs.* 3143 and 67.

CASE 190.—Private Philo Wilbur, Co. I, 185th New York, aged 19 years, was wounded in action at the Southside Railroad, Virginia, March 25, 1865. A conoidal ball entered over the left trochanter major, produced a comminuted fracture of the process, and emerged at the lower and inner border of the left buttock. He was taken to City Point and Washington and admitted, on April 2d, into the Mount Pleasant Hospital. On April 7th there was febrile action and anorexia. On April 9th, Assistant Surgeon H. Allen, U. S. A., removed several detached fragments of bone. Irritative fever and anorexia continued. On April 14th he had a rigor; pyæmia appeared, with vomiting and diarrhœa. On April 18th secondary hæmorrhage of from six to eight ounces occurred from branches of the external circumflex, and was arrested by compression of the femoral. He died April 20, 1865. The history, with the specimens 3143 and 67 (FIG. 43), were contributed by Assistant Surgeon H. Allen, U. S. A.—(*Circular* No. 2, p. 106, CASE 274.)

CASE 191.—"Alfred G. R——, Adjutant 134th Pennsylvania, aged 24 years, was wounded in the upper part of the left femur by a round ball, which partially fractured the trochanter major, at the battle of Fredericksburg, December 13, 1862. The wound received no attention for some days, and was then dressed with side splints firmly bound by a roller, a plug of lint being tightly inserted in the wound. On the 20th of December he was admitted to E Street Infirmary, Washington. He stated that for some days he had experienced occasional twitchings in the limb, and had taken large doses of opium. The wound was a little behind the trochanter major. Upon removing the plug of lint about half a pint of blood and pus was discharged. There was no crepitus upon rotation, nor shortening. Owing to his weakened condition, no extended search was made for the missile. Simple dressings were applied, and half grain doses of sulphate of morphia were given. For the two succeeding days he seemed to improve. The twitchings of the limb occurred every few minutes, with occasional intermissions of a few hours. On the 23d the spasms became more violent and frequent, and it was deemed advisable to extract the missile. He was etherized, and the wound was enlarged two inches downward and backward. A gum catheter was made to follow the course of the missile behind and beneath the neck of the femur to the body of the pubis, where the ball was found in the scrotum near the spermatic cord. A flattened round musket ball was extracted through an incision at the base of the scrotum. A portion of it had

[1] *Circular* No. 2, 1869: CASE 15, p. 67, Pt. *T. B*——, 14th North Carolina, *Spec.* 548. CASE 20, p. 68, Pt. J. C——, I, 10th New Jersey, *Spec.* 3806. CASE 22, p. 68, Pt. J. (*Confed. States Med. and Surg. Jour.*, January, 1865). CASE 274, p. 106, Pt. P. Wilbur, I, 185th New York, *Spec.* 3143. *Second Surgical Volume*: CASE 859, p. 295, Serg't W. Spendlove, E, 1st New York Cav., and CASE 935, p. 324, Serg't C. Moulton, D, 2d Maryland.

been chipped off. The patient rested well that night, but on the following day the spasms were increased in intensity, commencing in the injured limb and extending over the body. Cloths saturated with chloroform and olive oil were applied to the limb, and an antispasmodic and anodyne mixture was prescribed. He rested quietly until the following morning, when clonic spasms returned and persistently increased. The patient's countenance became pinched, wan, and haggard, and expressive of fright. There was no pain nor trismus, and he partook freely of nourishment. At times there was complete opisthotonos. On December 25th he took four dozen pills of assafœtida of four grains each, and one half ounce of fluid extract of Cannabis Indica in divided doses, without any benefit. Sulphate of morphia in doses of one grain was then prescribed, to be administered every two hours, and a poultice of powdered opium and cinchona applied to the wound, but, as before, without apparent benefit. The mind, up to this time, continued clear and undisturbed, his pulse moderately full and strong, ranging at about 100. He now became drowsy, and at times lay in a semi-comatose condition. His pulse ran up to 150. Respiration was free, but at times hurried, from 25 to 28 per minute. The skin became bathed in sweat, which exhaled a peculiar pungent odor. The bowels were regular; the urine was scantily secreted and high colored, though voided without difficulty. The discharge from the wound was thin, bloody, and offensive. On December 27th opisthotonos recurred, and was temporarily relieved by the application of chloroform to the entire extent of the spine. Subsequently, violent epileptiform convulsions set in, and death resulted from exhaustion, on December 28, 1862." The pathological specimen is figured in the wood-cut (FIG. 44). and shows a fracture of the great trochanter of the left femur and a piece of a leaden ball embedded in the neck. The specimen and history were contributed by Surgeon C. L. Allen, U. S. V.—(*Circular* 2, S. G. O., 1869, p.80, CASE 94.)

FIG. 44.—Fracture of trochanter and neck of the left femur by a round musket ball. A fragment of lead is impacted in the neck. *Spec.* 545.

CASE 192.—"Sergeant David Y——, Co. H, 106th New York, aged 29 years, was wounded at the battle of Monocacy Junction, July 9, 1864, by a conoidal musket ball, which entered two inches posterior to and one inch above the right trochanter major, passed forward and inward, and lodged in the neck of the femur at its middle portion. He was admitted to General Hospital at Frederick, Maryland, on the same day, and the wound did well until the 12th of July, when it assumed an unhealthy appearance. A careful examination was made with the finger and by the probe, and the integuments and fascia were divided, giving free exit to sanious and fetid pus. Large quantities of stimulants and beef tea were given. On July 19th symptoms of pyæmia made their appearance, such as rigors followed by profuse perspiration and acceleration of the pulse and respiration, dryness of the tongue, and anorexia. Another examination of the wound was made, and the ball was found embedded in the femur, but, owing to the patient's condition, its removal was deemed inadvisable. On July 20th another rigor occurred, and gradual aggravation of all the symptoms followed. He died at 3 o'clock P. M., July 22, 1864." The pathological specimen and history (FIG. 45) were contributed to the Army Medical Museum by Assistant Surgeon R. F. Weir, U. S. A.—(*Circular* 2, p. 84, CASE 122.)

FIG. 45.—Fissure of right femur, caused by a conoidal ball lodging in the neck. *Spec.* 3931.

CASE 193.—"Captain James M. L——, Co. I, 20th Indiana, was twice wounded in an engagement in front of Richmond, on June 27, 1862. The first wound was through the lumbar muscles, and, while lying on the field, he was again struck by a conoidal musket ball, which entered on the outer side of the left thigh a little below the great trochanter, and, passing upward and inward, lodged. He was conveyed to Washington, and on June 29th was admitted to the Columbia College Hospital. A finger could be readily passed into the perforation of the femur, but the ball could not be reached. There was no shortening or eversion of the limb, interfering with the motion of the joint. Three formal attempts to ascertain the position of the ball and accomplish its removal were unsuccessfully made. The patient died from exhaustion, August 19, 1862." The specimen is represented in the adjoining wood-cut (FIG. 46). It shows the upper portion of the left femur perforated between the trochanters on the posterior surface. The track of the ball is carious. The great trochanter has been split off, but is reunited by callus. The space between the trochanters is bridged over by a displaced fragment of bone, attached in its new position by slight osseous deposits. The missile was found resting against the capsular ligament. Assistant Surgeon W. M. Notson, U. S. A., who attended and reported the case, is confident that the ball was external to the joint; but as the grooving of the neck extends upward nearly to the articular surface of the femur, it is hardly possible that the joint escaped.—(*Circular* 2, p. 75, CASE 69.)

FIG. 46.—Perforation of the neck of left femur by a conoidal musket ball. *Spec.* 565.

In twenty-seven of the two hundred and forty-nine shot fractures of the hip joint with fatal terminations the parts of the joint involved were not indicated. The details in the cases are very meagre, and no autopsies were made. Fifteen have been recorded in *Circular* No. 2;[1] such information as was obtainable of the remaining twelve will here be given:

CASE 194.—Private J. Cilley, Co. E, 19th Maine, aged 22 years, was wounded at Petersburg, June 22, 1864, by a conoidal ball. He was taken to the field hospital of the 2d division, Second Corps, where Surgeon J. F. Dyer, 19th Massachusetts, noted: "Shot fracture of the left hip joint." On July 1, 1864, he was admitted into the Carver Hospital, Washington, and he died August 30, 1864. Surgeon O. A. Judson, U. S. V., reports cause of death: "Exhaustion following shot fracture left ilium."

[1] *Circular* 2, 1869: CASE 2, p. 65, Corp'l J. A. Baker, C, 49th New York. CASE 7, p. 66, Pt. C. S. Bates, G, 27th Michigan. CASE 13, p. 67, Corp'l W. Bowen, K, 56th Penn. CASE 37, p. 70, Pt. J. Forbes, C, 31st Mass. CASE 39, p. 70, Pt. S. Fowler, 4th Michigan Battery. CASE 60, p. 74, Pt. W. Jackson, B, 106th New York. CASE 63, p. 74, Pt. H. Jones, I, 151st Penn. CASE 87, p. 79, Lieut. M. Mullen, G, 69th Penn. CASE 97, p. 81, Corp'l J. Robinson, I, 3d Maryland Cavalry. CASE 105, p. 82, Capt. R. Shaw, K, 56th Penn. CASE 184, p. 92, Pt. J. Welis, C, 1st Mass. H. A. CASE 202, p. 95, Pt. J. E. Clark, E, 23d Pennsylvania. CASE 210, p. 95, Pt. *A. Latten*, Morgan's Command (see *Confed. States Med. and Surg. Journal*, 1865, p. 9). CASE 250, p. 101, Pt. E. Powell, A, 3d U. S. C. T. CASE 252, p. 101, Pt. J. Shafer, A, 7th Maryland.

CASE 195.—Private J. Farrell, Co. B, 14th U. S Infantry, aged 35 years, was wounded at Spottsylvania, May 12, 1864, and admitted to the field hospital of the 2d division, Fifth Corps. Surgeon W. R. DeWitt, jr., recorded: "Gunshot wound of left thigh; severe." On May 18th the wounded man was received into Douglas Hospital, Washington. Assistant Surgeon W. Thomson, U. S. A., reported: "Gunshot wound of left hip; fracture of pelvis and femur. Hæmorrhage to the amount of two ounces occurred from a muscular branch on May 28th, and ceased spontaneously. The patient died of asthenia May 28, 1864.

CASE 196.—Colonel C. Knoderer, 167th Pennsylvania, was wounded at Suffolk, January 30, 1863. Surgeon D. M. Marshall, of the regiment, reported: "Wound of left hip produced by a piece of shell, completely shattering the hip joint and causing immediate prostration. Stimulants were given internally, and cold applications, combined with styptics, were used. Death occurred on February 15, 1863."

CASE 197.—Corporal E. W. Mulford, Co , E, 74th Illinois, was wounded at Chattanooga, November 25, 1863, by a conoidal ball, which fractured the right hip. He died December 10, 1863, in the 2d division, Fourth Corps, field hospital. Surgeon F. W. Lyth, 36th Illinois, records the case.

CASE 198.—Private M. Murphy, Co. D, 8th New York Heavy Artillery, was wounded at Cold Harbor, June 3, 1864, by a conoidal ball. He was taken to the field hospital of the 2d division, Second Corps, where Surgeon J. F. Dyer, 19th Massachusetts, records: "Shot fracture of the right hip joint and wound of both shoulders." He died June 6, 1864. The cause of death is given on the burial records as "shot wound of bowels."

CASE 199.—Private A. Olds, Co. F, 8th New York Heavy Artillery, was wounded at Cold Harbor, June 3, 1864, and admitted to the field hospital of the 2d division, Second Corps. Surgeon J. F. Dyer, 19th Massachusetts, reported: "Gunshot fracture of left hip joint. Died June 5, 1864."

CASE 200.—Private C. Pease, Co. C, 4th Michigan, was wounded in the left hip at Gettysburg, July 2, 1863. He was treated at a Fifth Corps field hospital until July 24th, when he was admitted to Camp Letterman. Surgeon H. Janes, U. S. V., reported that the man "died August 7, 1863, of gunshot fracture of left hip joint."

CASE 201.—Private H. Stratton, Co. B, 99th Pennsylvania, was wounded at Gettysburg, July 2, 1863, by a conoidal ball. He was taken to the field hospital of the 1st division, Third Corps, where Surgeon G. W. Lyman noted: "Gunshot compound comminuted fracture of the right thigh implicating the hip joint." He died July 4, 1863.

CASE 202.—Private J. J. Stumple, Co. A, 7th West Virginia, was wounded at Cold Harbor, June 3, 1864, by a conoidal ball. He was taken to the field hospital of the 2d division, Second Corps, where Surgeon J. F. Dyer, 19th Massachusetts, noted: "Shot fracture of the right hip." He was admitted into the Second Division Hospital, Alexandria, June 7th, where Surgeon T. R. Spencer, U. S. V., records "shot wound, right thigh." He died June 25, 1864.

CASE 203.—Private T. O. Tucker, Co. D, 61st Pennsylvania, aged 39 years, was wounded at Spottsylvania, May 15, 1864, by a shell. He was taken to the field hospital of the 2d division, Sixth Corps, where Surgeon S. J. Allen, 4th Vermont, noted: "Wound of the right groin." On May 26, 1864, he was admitted into the Second Division Hospital at Alexandria. He died the following day. Surgeon T. R. Spencer, U. S. V., reported the cause of death "shot wound of the right hip joint."

CASE 204.—Private J. Volkommer, Co. C, 46th New York, aged 19 years, was wounded at Petersburg, July 30, 1864, and admitted to the field hospital of the 3d division, Ninth Corps. Surgeon P. A. O'Connell, U. S. V., reported: "Gunshot wound of left hip; ball entered one and a half inches from the trochanter major, wounding the capsular joint." Three days after the reception of the injury the wounded man was transferred to the Depot Hospital at City Point, whence he was sent to De Camp Hospital, David's Island, New York Harbor, August 7th. Assistant Surgeon W. Webster, U. S. A., in charge of the latter, reported that the patient died November 19, 1864, of "gunshot wound of left hip, with fracture of femur."

CASE 205.—Private *S. Waisner*, Co. E, 28th North Carolina, was wounded and captured at Gettysburg, July 3, 1863, and entered Camp Letterman on July 23d. Surgeon H. Janes, U. S. V., reported: "Gunshot fracture of right hip joint. Death on August 18, 1863."

Of the series of two hundred and forty-nine cases of shot fractures of the hip joint unsuccessfully treated by conservation, fifty-two have been detailed in the preceding pages and one hundred and ninety-seven cases have been briefly noted, the details of the cases having been cited in *Circular* No. 2.

In one hundred and eighty-four cases the injuries were caused by small, and in fifteen cases by large projectiles, while in fifty instances the nature of the missile was not indicated. Fragments of bone were removed in twenty-one of the two hundred and forty-nine fatal cases of shot fracture of the hip joint treated by conservation. Pyæmia was indicated in thirty-eight instances, gangrene in thirteen, tetanus in one case, erysipelas in one case, peritonitis in five cases, and secondary hæmorrhage in fourteen cases. In one instance (CASE of John McCarthy, Co. E, 76th New York, *Circular* No. 2, p. 76, CASE 71, and foot-note 1, p. 85) the femoral artery was tied, and in two instances (CASES of: Corporal J. F. Smith, Co. B, 1st Wisconsin, *Circular* No. 2, p. 82, and 107, of Private C. Hambrecht, Co. E, 4th New Jersey, CASE 181, p. 84, *ante*) the external iliac artery was

ligated. In four instances the missile penetrated the abdomen; in nine cases the pelvic cavity was pierced, but apparently without injury to the viscera. In fifteen cases a shot fracture of either the ilium, ischium, or os pubis was reported; in two instances the bladder was involved,[1] and in twenty-two cases the injury to the hip joint was complicated by various other injuries of less gravity. Eleven patients died on the day of the reception of the injury; fifty-three survived the injury from one to ten days; seventy, from eleven to twenty days; thirty-two, from twenty-one to thirty days; twenty-one, from thirty-one to forty-days; the remaining sixty-two patients lived from forty-one to two hundred and sixty-three days, and one patient lingered for nearly two years and a half.[2] In eighty-three instances it was reported that the missile had lodged, in nineteen of which it was stated to have been extracted.

In seventy-eight of the two hundred and forty-nine fatal cases of shot fracture of the hip joint treated by conservation, the specimens indicating the bony lesion at the hip are preserved in the Army Medical Museum. Illustrations of forty of these seventy-eight specimens were given in *Circular* No. 2, pp. 66–114, and twenty-one have been represented by wood-cuts in the preceding pages.

In tabular statement IX, on page 65, *ante*, the total number of alleged shot fractures at the hip joint treated by the conservative expectant mode was given as three hundred and four, of which fifty-five were reported to have recovered; but, from an analysis of the cases, it becomes clearly evident that it would be impossible to arrive at just conclusions regarding the mortality of injuries of this nature from the total number of cases tabulated. It has already been stated on pp. 76, 77, *ante*, that in fourteen of the fifty-five cases of recovery after alleged shot fractures at the hip joint the evidence is contradictory, or adverse to the supposition that the hip was implicated; that in nineteen instances the evidence is vague and insufficient, and that in two cases the testimony consists solely of the statements of examining surgeons based upon examinations made long after the injury had healed. Deducting these thirty-five cases, there remain two hundred and sixty-nine cases with twenty recoveries, giving a mortality of 92.5 per cent. But it was further stated on pages 76 and 77, *ante*, that in twelve instances the evidence is compatible with the supposition that the fractures were probably in the trochanteric region, and that in five instances the fractures were extracapsular. Eliminating these seventeen cases, there remain only two hundred and fifty-two cases with three recoveries, or a mortality rate of 98.8 per cent. Of the three patients that recovered after undoubted intracapsular shot fracture of the hip joint, one, Private T. C. Garvin, Co. H, 94th New York (CASE 143, *ante*), died nearly four years after the reception of the injury, from which pus and portions of the joint, consisting of splinters of bone, were discharged to the time of his death. In the case of *T. L. Lomax* (CASE 140, *ante*), in which it remains a disputed point whether it should be regarded as an example of treatment by excision or by conservation, it was impracticable to ascertain whether the patient is still living. The third patient, Colonel J. C. Strong (CASE 134, *ante*), was in tolerably good health in December, 1878.

From the evidence recorded on the registers of this Office in the alleged examples of recovery after shot fractures of the hip joint treated by temporization, I must continue to share the unfavorable impression of the results in this class of injuries of Guthrie, and

[1] The details of these cases have been published with Injuries of the Parts Contained in the Pelvis, Section II, Chapter VII, *Second Surgical Volume*, viz: Sergeant T. A——, Co. C, 119th New York, CASE 922, p. 318; see also Note 2, p. 77, *ante*; and Sergeant W. Spendlove, Co. E, 1st New York Cavalry, CASE 859, p. 295, and Note 1, p. 85, *ante*.

[2] Case of Private Louis Schmidt, 8th Kansas, wounded at Chickamauga, Sept. 19, 1863, died Jan. 3, 1866. *Circular* No. 2, 1869, CASE 271, p. 105.

many of the older as well as more modern writers on military surgery, and can only reiterate the conclusion that I have already expressed in *Circular* No. 6, at page 61, and in *Circular* No. 2, at page 117, that shot injuries of the hip joint, when abandoned to the resources of nature, prove almost uniformly fatal.[1]

With regard to the twenty-five cases of recovery after shot injuries of the hip joint under conservative treatment in the Franco-German War, 1870–71, tabulated by Professor von Langenbeck, and alluded to on page 67, *ante*, it may be hoped, in the interest of surgical science, that the future histories of these patients will be noted, and that when death ensues it may be found practicable to have the extent of the injury to the hip joint precisely ascertained by *post-mortem* examination. The difficulties of such a task are apparent and have hitherto proved insurmountable. In five of the fifty-five cases of recovery after alleged shot fracture at the hip joint cited from the American civil war, the patients have since died; but so far the opportunity to verify the diagnosis by an autopsy has not been improved.

EXCISION AT THE HIP AFTER SHOT INJURY.—A large addition to our statistical information on this subject was afforded by the experience of the American civil war as indicated by the accompanying tabular statement:

TABLE X.

Numerical Statement of Sixty-six Cases of Excision at the Hip Joint for Shot Injury.

OPERATIONS.	CASES.			PER CENT. OF MORTALITY.
	Recovery.	Fatal.	Total.	
Primary Operations	1	32	33	96.9
Intermediary Operations	2	20	22	90.9
Secondary Operations	3	8	11	72.7
Aggregates	6	60	66	90.9

"Twelve cases of excision of the head of the femur for gunshot injury are all that are recorded in print, prior to 1861," is correctly asserted at page 17 of the report from this Office[2] published in 1869; but it is now known[3] that in the Italian Campaign of 1859 Dr. J. Neudörfer excised at the hip for shot injury four times, at least, which gives a total

[1] In note 1, of page 62, *ante*, it was attempted to give, in chronological order, the earliest references to cases of shot wounds of the hip in military surgical literature, and the first case adverted to was that of Private S. Kirsky, in 1677, related by PURMANN (M. G.) (*Funfftzig Sonder-und Wunderbahre Schusswunden Curen*, Frankfurt, 1721, Obs. XLIII, p. 324). After page 62 had gone to press, the following case, cited by Dr. JOSEPH SCHMIDT (*Speculum Chirurgicum oder Spiegel der Artzney*, Augspurg, 1656, p. 144), which antedates the case of PURMANN by 33 years, came to the editor's notice: "In the month of May, 1634, while the here-stationed Swedish regiment was being mustered in the castle-yard, a sergeant, whose quarters were with Mr. Peter Rehlinger, was accidentally shot through the hip. He was conveyed in a trough to his quarters. I was called upon to see the case, but found that there was great difficulty in the way of bandaging and that the thigh was greatly swollen, the wound of entrance being as large as a hen-egg. On probing the wound I readily discovered the bare bone, with every indication that the shaft must have been split. Great hæmorrhage had also taken place; his system was in a bad condition, unfavorable for a cure. The symptoms hourly grew more aggravated and became so severe as to terminate his life on the sixth day. After his death, I endeavored to obtain the consent of the officers to let him be opened, which was readily granted. When I did open him I discovered that the upper part of the femur, the head which enters the hip bone, was comminuted, as if it had been done with a hammer upon an anvil. There was also a long fissure in the shaft running down towards the knee; the great trunk of the artery was torn, and the condition of the soft parts, inwardly near the bone, was so offensive that I can hardly describe it. It was no wonder that he lost his life from so severe an injury. Should he have recovered he would have done so with a bad walk." An instance from the Turco-Russian War of 1877, is related by KADE (E.) (*Das temporäre Kriegslazareth der Anstalten der Kaiserin Maria im Kloster Mariahimmelfahrt by Sistowa*, in *St. Petersburger Medicinische Wochenschrift*, 1877, No. 45, p. 383): A soldier, on August 31, 1877, received a shot wound of the right coxo-femoral joint without separation of continuity of bone. The ball lodged with its point in the neck of the femur. On September 12th, the wound was enlarged and the missile extracted. The patient died September 17th, of septicæmia following suppuration of the joint.

[2] OTIS (G. A.), *A Report on Excisions of the Head of the Femur for Gunshot Injuries. Circular* No. 2, War Department, Surgeon General's Office, January 6, 1869, 4to, pp. 141.

[3] LONGMORE (T.), *Gunshot Wounds*, in T. HOLMES's *System of Surgery*, 2d ed., London, 1870, Vol. II, p. 230.

of sixteen examples of this operation in military surgery prior to our war. Of these, a primary excision by Mr. T. C. O'Leary, in the Crimea, in 1855, was successful. The patient died ten years afterwards of phthisis. A secondary excision, by Dr. Neudörfer, in 1859, was followed by amputation at the hip, which the patient happily survived. In the foot-note[1] instances of excision at the hip for shot injury are enumerated, in addition to those practised in the United States service.

At the date of the publication of *Circular* No. 2, S. G. O., January, 1869, the records of this Office contained sixty-three, as was then believed, authenticated cases of excision of the head, or of the head and neck, or head and neck and portion of the shaft of the

[1] 1. OPPENHEIM (F. W.) (*Die Extirpation des Schenkelkopfes aus der Gelenkhöhle*, in *Zeitschrift für die gesammte Medicin*, Hamburg, 1836, B. I, S. 137); a Russian chasseur wounded May 5, 1829, at the battle of Eski-Arna-Utlar; fracture of neck of left femur and rim of acetabulum. Primary excision May 5, 1829; death from plague May 23, 1829.—2. SEUTIN (*Resection de la partie supérieure du fémur*, in *Bulletin Général de Thérapeutique*, Paris, 1833, T. IV, p. 371); Private Lisieux, 25th Infantry; fracture of neck, trochanters, and upper fourth of right femur. Primary excision December 8, 1832; death on the fourth day, from gangrene.—3. C. TEXTOR (KARL TEXTOR, *Der Zweite Fall von Aussägung des Schenkelkopfes mit vollkommenem Erfolg*, Würzburg, 1858, S. 15, No. 12); Kaspar Artes, aged 44; caries of head of right femur consequent upon gunshot fracture. Secondary operation on November 8, 1847; death on November 18, 1847.—4. Dr. H. SCHWARTZ (*Beiträge zur Lehre von den Schusswunden*, Schleswig, 1854, p. 142); O——, Danish soldier; shot fracture of trochanters of left femur. Intermediary excision May 13, 1849; death, May 20, 1849.—5. Dr. G. ROSS (*Deutsche Klinik*, 1850, B. II, p. 451); Karl Engelking, aged 23, received, at Fredericia, May 8, 1848, a shot fracture of the left trochanter. Secondary excision, June 10, 1850; death, June 13, 1850.—6. Professor BAUM (LOHMEYER, *Die Schusswunden*, 1859, p. 199); a subaltern officer; shot comminution of neck of femur. Primary excision in 1854; death in twenty-two hours.—7. G. E. BLENKINS (G. H. B. MACLEOD, *Notes on the Surgery*, etc., London, 1858, p. 311, and G. J. GUTHRIE, *Commentaries*, London, 1855, p. 621); Private C. Mousterey, 3d Batt. Grenadier Guards; shell fracture of neck and trochanters of right femur. Primary excision in June, 1855; death in five weeks.—8. G. H. B. MACLEOD (*Notes on the Surgery of the War in the Crimea*, 1858, p. 338); Private Couch, of the Rifle Brigade; fracture of the neck of left femur, June 18, 1855. Intermediary excision July 5; death from cholera July 10, 1855.—9. Surgeon J. CRERAR (G. J. GUTHRIE, *Commentaries*, 6th ed., London, 1855, p. 622); Private W. Smith, 1st Royals; grenade fracture of trochanter and neck of left femur. Primary excision August 6, 1855; died August 21, 1855.—10. T. C. O'LEARY (T. P. MATTHEW, *Medical and Surgical History, etc., during the War against Russia*, 1854-'55-'56, London, 1858, Vol. II, p. 378); Private T. McKevena, 68th Regiment; shell fracture of trochanter and neck of left femur. Primary excision August 20, 1855; recovery.—11. Dr. GEORGE HYDE (MATTHEW, *l. c.*, Vol. II, p. 378); Corporal B. Sheehan, 41st Regiment; grapeshot comminution of trochanter and neck of femur. Primary excision September 8, 1855; death September 14, 1855.—12. Dr. COOMBE (MACLEOD, *loc. cit.*, p. 344); British artillery soldier; shot fracture of neck of femur. Intermediary excision in 1855; death in a fortnight.—13-19. J. NEUDÖRFER (*Das Endresultat der Gelenkresectionen*, in *Wiener Med. Presse*, 1871, B. XII, p. 407) remarks: "I have performed the hip joint resection for shot wounds seven times; six died from the eighth to the eleventh day, and the seventh I exarticulated at the hip after a few days on account of purulent infiltration of the excised joint. The patient recovered after the exarticulation, and lives here in Vienna." J. Schranz, 7th Jæger Bat., wounded at Palestro, May 30, 1859. Excision at left hip joint November 27th. Purulent infiltration followed, and, on December 1, 1859, amputation at the hip joint was performed by Professor NEUDÖRFER. The patient recovered, and lived in Vienna in 1868. During the Schleswig-Holstein War, 1864, Dr. NEUDÖRFER twice excised the hip joint, on Austrian soldiers, for shot fracture of the upper extremity of the femur. Intermediary operations. Both cases proved fatal (C. HEINE, *Die Schussverletzungen*, etc., 1866, p. 369). Of the remaining four operations by NEUDÖRFER I have been unable to find any details.—20. A successful secondary excision of the hip joint for shot wound received in the Austro-Prussian War, 1866, was performed by Dr. WAGNER in Königsberg. NEUDÖRFER (*Handbuch der Kriegschir.*, Leipzig, 1872, Zweite Hälfte, Abth. 2, p. 1458) states that he saw the patient in November, 1866, at Görlitz, when his recovery was yet doubtful, but that in 1872 the patient was living at Graz, entirely recovered. He could walk without a cane, and could ascend and descend stairs.—21-23. B. von LANGENBECK (*Über die Schussfracturen der Gelenke*, 1868, p. 16); Kucharsky, aged 18, fracture of left trochanter, March 22, 1863. Secondary excision July, 1863; death in fourteen days. Austrian soldier, wounded July 3, 1866; shot fracture of the neck of the right femur. Intermediary resection August 5, 1866; death August 12, 1866. Emil Bauer, 10th Saxon Infantry, wounded June 29, 1866; shot fracture of the neck of right femur. Secondary excision August 20th; death in September, 1866.—24. Dr. SCHÖNBORN (B. v. LANGENBECK, *loc. cit.*, p. 16); Maxim Glutschak, aged 24; wounded July 3, 1866, fracture of head of the right femur. Secondary resection August 22, 1866; recovery.—25. B. BECK (*Kriegschir. Erf.*, 1867, p. 351); A. F. S——, Würtemberg drummer, wounded July 24, 1866; shot fracture of neck of femur and trochanter major. Intermediary resection August 5th; died August 7, 1866.—26. L. STROMEYER (*Erfahrungen über Schusswunden*, 1867, S. 52); a debilitated subject; intracapsular shot fracture of the neck of the femur. Intermediary resection in 1866; death in two days.—Stabsarzt Dr. DEININGER, of the Railway Battalion (*Beiträge zu den Schussfracturen des Hüftgelenks unter besonderer Berücksichtigung der Erfahrungen aus dem Feldzuge 1870-71, und Benutzung der Acten des Königlichen Kriegsministeriums*, in *Deutsche Mil.-arztl. Zeitschrift*, 1874, Jahrgang III, pp. 237-335), gives a tabular statement of forty-five cases of resection of the head of the femur for shot injury, from the Franco-Prussian War, 1870-71. The cases are: 1 primary case fatal, 26 intermediary cases (all fatal), and 17 secondary (with 5 recoveries and 12 deaths), and 1 case in which the time of operation was not recorded. Brief details are given: 27. A. Stephan, 3d Pioneer Bat.; shot fracture of neck and trochanter major of left femur, September 20, 1870; excision same day, by Dr. B. BECK; died September 29, 1870.—28. Piurko, 22d Infantry; shot fracture of trochanter and neck of right femur, September 23, 1870; excision October 25, 1870, by SZMULA; recovered, with useless limb.—29. A soldier wounded at Orleans; comminution of head of femur; intermediary excision, by Dr. METZLER; died 4 days after operation.—30. J. B. Müller, 85th French Line; shot fracture of head of right femur and rim of acetabulum at Beaune la Rolande, November 28, 1870; excision, by Dr. RÜPPEL, December 2d; died December 7, 1870.—31. Corporal Heinartz, 75th Prussian, wounded at Orleans, December 9, 1870; ball fractured acetabulum and opened joint; excision, December 14th, by Dr. LANGENBECK; died of septicæmia, December 20, 1870.—32. A. Eichner, 2d Prussian Lancers; shot fracture of head of right femur, Orleans, December 4, 1870; excision, by Dr. LANGENBECK, December 12th; died December 18, 1870.—33. J. Schone, wounded at Weissenberg, August 4, 1870, splintering trochanter and head of femur; excision, by Dr. CZERNY, August 13th; died August 16, 1870.—34. M. Echterbruch, Corporal, 78th Infantry; shot fracture of left femur below the greater trochanter, August 16, 1870; excision, by Dr. MÜLLER, August 26th; died Sept. 7, 1870.—35. J. Pakowsky, 14th Inf., wounded December 3, 1870, in left hip joint; excision, December 14th, by Dr. NEWHAUS; died December 20, 1870.—36. J. Unterberg, Oldenberg Infantry No. 91; shot fracture of left trochanter, August 16, 1870; excision, August 27th, by Dr. A. EWALD; died Sept. 9, 1870.—37. J. Wiedener, 52d Infantry, shot wound in right hip joint, August 16, 1870; excision, by Dr. TRENDELENBERG, August 28th; died September 2, 1870.—38. F. Kopzinsky, 5th Artillery, shot fracture of left hip joint, Sept. 19, 1870; excision, October 2d, by Dr. WEGNER; died October 28, 1870.—39. J. Busse, 24th Infantry, shot fracture of the left femur, August 16, 1870; excision of hip joint, August 29th, by Dr. MARCUSE; died Sept. 7, 1870.—40. F. Patzwald, 9th Infantry, shot wound of left hip joint, December 2, 1870; excision, by Dr. BRASCH, December 16th; died December 21, 1870.—41. V. Vaillant, 42d French Line, shot fracture head of left femur, September 30, 1870; excision, October 14th, by Dr. GRANDIES; died October 17, 1870.—42. A. Dettki, 41st Infantry, shot comminution of neck of left femur, August 31, 1870; excision, by Dr. SACHS, Sept. 15th; died October 11, 1870.—43. P. Congacz, French Guards No. 3, shot fracture of head of left femur, August 18, 1870; excised, by Dr. LANGENBECK, September 1st; died Sept. 2, 1870.—44. C. C. Petit, French Infantry No. 67, comminution of left hip joint, August 16, 1870; excision, by Dr. LANGENBECK, September 1st; died September

femur, for shot injury. It has since been ascertained that in one of these cases the head of the femur was not removed;[1] but records of four additional cases[2] have since been obtained and added to the list of this operation, making a total of sixty-six cases of excision at the hip joint done for shot injuries received during the American civil war. As indicated in TABLE IX, at page 65, *ante*, fifty-five of these operations were performed for shot injuries of the hip joint, while in eleven instances the excision was practised for fracture of the shaft of the femur that did not primarily implicate the hip.

4, 1870.—45. C. Pacot, 50th French Infantry, shot fracture of neck of right femur, Weissenburg, August 4, 1870; excision, by Dr. BILLROTH, Aug. 20th; died August 20, 1870.—46. W. Liesegang, 24th Infantry, shot fracture of neck of left femur, Vionville, August 16, 1870; excision, September 2d, by Dr. GAEHDE; died September 3, 1870.—47. E. W. Hoffman, of the Prussian Guards, shot fracture of hip joint, St. Privat, August 18, 1870; excision, by Dr. LÜCKE, September 5th; died September 13, 1870.—48. A. Weinert, Corporal, 10th Dragoons, wounded in trochanter major, August 14, 1870; excision, by Dr. FISCHER, September 1st; died September 13, 1870.—49. B. Payant, 32d French Infantry, shot fracture of upper third of right femur, August 16, 1870; excision, September 4th, by Dr. NEUHAUS; died September 8. 1870.—50. A. Piasecki, 5th Infantry, comminution of neck of left femur, September 9, 1870; excision, by Dr. WAGNER, September 29th; died October 11, 1870.—51. P. Perrot, 13th French Infantry, comminution of right femur into joint, Gravelotte, August 8, 1870; excision, by Dr. BUSCH, September 12th; died September 23, 1870.—52. J. Pitzer, 83d Infantry, comminution of trochanter major and neck of left femur, Wörth, August 6, 1870; excision, by Dr. PAGENSTECHER, September 1st; died September 10, 1870.—53. Sergeant-major B——, 3d French Infantry, shot fracture of trochanter and neck of right femur, Wörth, August 6, 1870; excision, by Dr. BECK, at the end of August; died in the latter part of September.—54. C. Schnock, of the Guard Sharpshooters, shot wound in left hip joint, St. Privat, August 18, 1870; excised, by Dr. BENSBERG, September 14th; died September 19, 1870.—55. P——, 61st Infantry, comminution of neck of left femur, January 21, 1871; excision, by Dr. VOLKMANN, February 20th; died February 22, 1871.—56. J. Blanchet, French Garde Mobilier, shot fracture of head of left femur, November 28, 1870; excision, by Dr. HEINEMANN, December 29th; died January 12, 1871.—57. E. Paschke, 58th Infantry, comminution of neck and trochanter of right femur, October 2, 1870; excision, by Dr. BORETIUS, November 6th; died November 16, 1870.—58. A. Schoblock, 7th Würtemberg Infantry, shot fracture of femur high up, Champigny, December 2, 1870; excision, by Dr. HUETER, January 6, 1871; died January 13, 1871.—59. Bartsch, 2d Guards, shot fracture below trochanter, with fissuring of neck of left femur, August 4, 1870; excision, September 13th, by Dr. SCHILLBACH; died in a few hours.—60. D. Blennemann, 7th Infantry, shot wound of hip joint, Gravelotte, August 18, 1870; excision, about six weeks later, by Dr. WINDSCHEIDT; recovery, with good use of limb and one and a half inch shortening.—61. E. Geier, 9th Infantry, shot through left hip joint, Wörth, August 6, 1870; excision, by Dr. BILLROTH, September 28th; died October 27, 1870.—62. Schaal, 10th French Infantry, shot wound in right hip, August 16, 1870; excision, by Dr. JOSEPHSON, October 24th; death October 25, 1870.—63. F. John, 8th Infantry, shot wound of right hip, fracture of acetabulum, Saarbrücken, August 6, 1870; excision, by Dr. HUPEDEN, November 4, 1870; recovery, with moderately free use of limb and one inch shortening.—64. B——, 2d Zouaves, shot fracture of upper third of femur, Wörth, August 6, 1870; excision six months after injury, by Dr. WELKER; recovery.—65. French soldier, shot fracture of hip joint September 30, 1870; secondary excision; recovery, with comparatively good use of limb.—66. J. Pieper, 21st Infantry, shot wound of left hip; secondary excision of head of femur, February 19, 1871, by Dr. JACOBY; died Feb. 23, 1871.—67. G. Rossmanieck, 4th Infantry, shot in left hip in August, 1870; secondary excision of hip joint; died Sept. 7, 1870.—68. P——, 17th Infantry, shot wound of right hip joint; secondary excision of joint; died.—69. Unknown soldier; secondary excision, by Dr. BATTLEHNER; fatal.—70. Unknown soldier; shot fracture of neck of femur; secondary excision, three months after injury, by Dr. HEPPNER; death in two weeks.—71. Unknown soldier, shot fracture of neck and trochanter; resection three and a half months after injury; died a week afterwards. In a tabular statement of cases of resection of the hip joint performed during the same period, and collected by Professor B. v. LANGENBECK (*Über die Schussverletzungen des Hüftgelenks*, in *Archiv für Klinische Chirurgie*, Berlin, 1874, B. XVI, p. 263), I find 7 cases (2 intermediary fatal cases, CASES Nos. 2, 5, pp. 329, 330,)—1 secondary fatal (CASE No. 14, p. 334)—and 4 fatal cases, period of operation not stated (CASES 12, 20, 21, and 27, pp. 333, 335, 336), not contained in Dr. DEININGER'S tables. They are: 72. Lieut. Roma, 9th French Infantry, shot fracture of left hip joint, August 18, 1870; excision, by Dr. LANGENBECK, August 31st; died September 4, 1870.—73. Petit, 67th French Infantry, shot fracture of right hip joint, Mars la Tour, August 16, 1870; excision, August 30th, by Dr. LANGENBECK; died December 10, 1870.—74. Unknown soldier, shot fracture of hip joint; excision, by Dr. BILLROTH; died 24 hours after operation.—75. Unknown soldier, shot fracture of pelvis; secondary involvement of hip joint; secondary excision of head and neck, by Dr. KÜSTER; death eight days after the operation.—76, 77. Unknown soldiers; excisions, by Dr. VOLKMANN; fatal.—78. Unknown soldier; excision of head of femur, by Dr. GRAF; fatal.—79. Another intermediary case of excision of head of femur for shot injury during the late Franco-Prussian War, 1870–71, not reported by either Dr. DEININGER or Professor B. v. LANGENBECK, is reported by Dr. GEORGE FISCHER (*Dorf Floing und Schloss Versailles*, in *Deutsche Zeitschrift für Chirurgie*, Leipzig, 1872, B. I, S. 227); unknown, fracture of head of left femur, September 30, 1870; wound of exit and entrance on a level with the trochanter major. October 20th, resection; October 28th, death from pyæmia. An operation ascribed to Dr. LUTTER, in *Lancet*, 1870, Vol. II, p. 452, is identical with the case described by Dr. H. FISCHER (*Kriegschir. Erf. vor Metz*, Erlangen, 1872, p. 200), and included in cases collected by Drs. DEININGER and v. LANGENBECK (No. 48, *ante*).—80–97. CHENU (J. C.) (*Aperçu hist. stat. et clin., etc., pendant la guerre de* 1870–71, Paris, 1874, T. I, p. 493) tabulates eighteen cases of excisions of the hip joint for shot fractures, in the Franco-Prussian War, 1870–71, with three recoveries. The same author (*loc. cit.*, T. II, pp. 1–150) records, by name, the cases of recovery after amputations, disarticulations, and excisions; but, after a careful search, I have been able to find only one of the (3) successful cases of excisions at the hip joint among them. The case is detailed on p. 85: "Lande (P. F.), born June 6, 1849, at Valognes (Manche), 109th line. Fracture of head of femur for shot wound. Resection of head of femur." The case is duplicated and again appears, on p. 86, as Laude, giving same details in every respect. I find no record of the two other cases. There is nothing to indicate whether the cases are primary, intermediary, or secondary operations. The cases reported by Dr. DUBREIL (*Gaz. méd. de Paris*, 1871, T. XVI, p. 314) and Dr. ARNAUD (GRELLOIS, *Hist. méd. de blocus de Metz*, 1872, pp. 351–353) are undoubtedly included in CHENU'S (*loc. cit.*, p. 493) statistics.—98. ROBERTSON (J. B.) (*Resection at the Hip joint—Removal of the Head with Four Inches of the Femur—Tetanus—Cure by Physostigma*, in *Pacific Med. and Surg. Jour.*, 1878, Vol. XX, p. 500), excised, on April 8, 1876, the head and four inches of the shaft of the femur in the case of George Miller, aged 45, who had suffered for over a year from a sinus, evidently resulting from a rifle shot received two years previously. The wound healed by first intention. Tetanus, which supervened about three weeks after the operation, was successfully treated with physostigma. In February, 1878, Miller was "well and able to ride on horseback and herd cattle in the mountains."—99. Dr. RUDDUCK (MAUNOURI, *Rapport sur le mouvement de l'ambulance No. 5 du Croissant Rouge à Orchanie, du* 17 *Octobre au* 8 *Novembre* 1877, in *Le Progrès Medical*, 1878, No. 1, p. 6) excised, on October 21, 1876, the head of the left femur in the case of Mehemet-Osman, for shot wound received in the Turco-Russian War; secondary operation; pneumonia; death. Summing up the cases of resection of the hip joint referred to in this note we have a total of 99 cases with 86 deaths, a fatality of 86.8 per cent. Of these 99 cases 8 were primary operations with 7 deaths (87.5 per cent.); 37 were intermediary, all fatal; 27 were secondary with 18 deaths (66.6 per cent.); and in 27 instances with 24 deaths the time of operation was not specified.

[1] The case of Lieutenant Dwight Beebe, 3d New York, cited in *Circular* 2, at page 32. Information received since the publication of the case proves it to be an example of removal of three and a half inches of the upper portion of the femur just without the capsule. The case will be detailed with excisions in the continuity of the femur in the third section of this chapter.

[2] CASES of: 1. Private *J. W. Epton*, Co. I, 5th South Carolina, referred to in *Circular* 2, at p. 120, but not included in the tabular statements on pp. 59 and 137; 2. Private *C. Raines*, Co. E, 25th North Carolina; 3. Private G. W. Tilliston, 1st Ohio Light Artillery; and 4. Private T. W. Pease, Co. H, 19th Indiana.

Primary Excisions.—Of thirty-three well authenticated primary excisions at the hip practised during the War, twenty were performed upon Union and thirteen upon Confederate soldiers. The only successful result was in the case of Private *Cannon*, a young soldier of a Georgia regiment, on whom Dr. J. J. Dement, of Huntsville, Alabama, operated. The particulars of the case were communicated by Dr. Claude H. Mastin, of Mobile, formerly Inspector of Hospitals in the Confederate service, and by Dr. J. B. Duggan, of Toombsborough:

CASE 206.—Private *Cannon*, Co. A, 49th Georgia, aged 24 years, was wounded at the battle of the Wilderness, May 5, 1864, by a conoidal musket ball, which struck an inch below the left trochanter major, extensively comminuting the femur and lodging in the adductor muscles. The Confederate line being forced back, the wounded man lay on the ground all night until the early morning, when the Confederates recovered their wounded. In *Cannon's* case, the consultation at the field infirmary by Surgeons J. J. Dement, Holt, J. J. Wynne, and F. P. Henderson, it was determined to enlarge the wound and remove the detached fragments of bone. Accordingly, the patient having been chloroformed, Surgeon Dement made an incision two inches upward from the entrance wound, and extending from the wound downward four inches. On ascertaining the condition of the parts, it was decided to exarticulate the head of the femur. This was readily accomplished, and then the neck and upper extremity of the shaft were removed. The fragments of the upper extremity of the femur, when put together, measured four and a half inches. The hæmorrhage during the operation was trivial. All the medical gentlemen present remarked upon the slight degree of shock induced by the operation. The limb and body were confined by roller bandage to a straight splint extending from the axilla to the foot. A full dose of sulphate of morphia was then administered. In a few hours the patient was placed in an ambulance wagon and conveyed to Orange Court House, twenty-five miles distant, and thence by rail to Staunton, about seventy miles farther, where the after treatment was conducted at the general hospital. Little can be learned of the after treatment, save that the patient was supplied with rich diet, a liberal allowance of wine, and that no untoward complication occurred except the formation of abscesses attendant on an exfoliation of a ring of bone from the upper end of the shaft. When this was eliminated, the wound rapidly healed. At the end of nine months the cicatrix was firm. The limb was shortened three inches, and was useless for purposes of locomotion. The patient was in fine health, and moved about on crutches. He went to his home, in Toombsborough, Georgia, in February, 1865, and earned a livelihood by his trade of shoemaking. He enjoyed good health until November 12, 1865, when he had an attack of diphtheria which terminated fatally on November 23, 1865.

The thirty-two unsuccessful primary excisions at the hip may be arranged in three categories. The first comprises thirteen instances where the circumstances were favorable, the patients of mature and robust organization, the lesions of bone limited to the upper extremity of the femur, the important vessels and nerves intact; the injuries to the soft parts were not excessive; there were no complications of wounds in other regions, and the patients were not subjected to hazardous removals; yet all thirteen succumbed within two or three days, or in one case as late as the fourth day, from the conjoined shock of the injury and the operation.

CASE 207.—Captain Frederick M. Barber, Co. H, 16th Connecticut, aged 32 years, was wounded at Antietam, September 17, 1862, by a musket ball, which entered behind the right trochanter major and shattered the trochanters and neck of femur. He was conveyed to the field hospital of the 3d division of the Ninth Corps. His general health was good, and there was but little shock. There was no swelling of the soft parts; the fracture was accessible to exploration, and appeared limited to the epiphysis. The case was one in which excision seemed peculiarly applicable, and, after a consultation of several surgeons of the division, that operation was decided upon. On the morning of September 18th, the patient being anæsthetised by chloroform, Surgeon Melancthon Storrs, 8th Connecticut, made a straight incision four inches long, passing through the wound of entrance. The comminuted fragments of the neck and trochanter were extracted, the round ligament divided, the head of the femur removed, and the fractured upper extremity of the shaft was sawn off by the chain saw. The edges of the wound were then approximated by adhesive straps, and simple dressings were applied. Little blood was lost, and the patient rallied promptly from the operation, and appeared quite comfortable during the day. Surgical fever soon set in, however; the patient sank rapidly under the constitutional irritation, and died on September 20, 1862.

CASE 208.—Sergeant Edwin T. Brown, Co. C, 21st Massachusetts, aged about 30 years, was wounded in front of Petersburg, on July 23, 1864, by a ragged fragment of a mortar bomb, which struck the left thigh over the trochanter major and comminuted the upper extremity of the femur. The wounded man was immediately conveyed to the hospital of the 1st division of the Ninth Corps. Surgeon Whitman V. White, 57th Massachusetts, and Surgeon James Oliver, 21st Massachusetts, saw the patient a short time after his admission to the hospital. He was a strong, healthy man, five feet ten inches in height, weighing about one hundred and sixty pounds, with a constitution of iron, and was in perfect health when injured. The soft parts about the seat of injury were lacerated and torn, and the upper extremity of the femur, to an extent of five inches, was crushed to fragments. No important arteries or nerves were wounded. Excision of the fractured bone was decided upon. On the afternoon of the day on which the injury was received chloroform was administered, and Dr. White made a longitudinal incision and removed the shattered fragments. The ligamentum teres was divided and the head of the bone turned out. The broken extremity of the shaft of the femur was evened off with a chain saw. The patient reacted promptly from the shock of

the operation. The limb was placed in proper position, and stimulants were freely used. Dr. Oliver states that he saw the man several times on the following day, who was in excellent spirits, and talked and laughed, and did not complain of any pain. On the 26th his appetite failed and he began to sink. He died July 27, 1864.

CASE 209.—Private *Charles Beard*, 12th Mississippi, was wounded and made a prisoner in the engagement on the Weldon Railroad, August 23, 1864. With nearly two hundred other wounded Confederates he was received at the field hospital of the 1st division of the Fifth Corps at Reams's Station, where it was found that a conoidal musket ball had entered the front of the right thigh a little to the outside of the course of the great vessels, and had comminuted the neck of the femur and fractured the head, and lodged in the acetabulum, of which the lower portion of the rim was broken off. A few hours after the reception of the wound the patient was placed under the influence of chloroform, and, after a thorough examination, it was deemed expedient to excise the upper extremity of the femur. The operation was performed by Surgeon A. A. White, 8th Maryland. An incision, commencing a little below the anterior superior spine of the ilium, was carried downwards below and behind the prominence of the trochanter major. From the lower extremity of the first, another incision, Dr. McGill states, was carried backwards. The muscular attachments were then dissected aside, and the chain saw was passed around the bone, which was divided just above the lesser trochanter. The head of the femur was then readily exarticulated, and the ball and splintered fragments were removed. The wound was then approximated by sutures and adhesive strips, and the limb was suspended by Smith's anterior splint. The patient reacted favorably; but very soon after the operation there was a marked rigor, and on the following day there was extreme irritability of stomach and retention of urine. The case terminated fatally on August 25, 1864, two days after the reception of the injury. At the autopsy, it was found that the fracture of the acetabulum did not communicate with the interior of the pelvis; but the articular surface was intensely injected; its cavity was filled with offensive sanious pus. The sawn extremity of the femur was black. One report states that the patient's appearance was of one who had undergone great privations and was not in a favorable condition to undergo any severe operation. The excised portions of bone, represented in the accompanying wood-cut (FIG. 47), were sent to the Army Medical Museum without a memorandum; but were ultimately identified, and numbered 1410 in the Surgical Section.

FIG. 47.—Shot fracture of head of right femur. *Spec.* 1410.

CASE 210.—Private Bartholomew Dempsey, Battery I, 4th Artillery, was wounded February 25, 1864, at Buzzard's Roost, Georgia, by a piece of shell, which passed through the upper portion of the right thigh, crushing the trochanter and neck of the femur, and producing fissures which extended to the head of the bone. The wounded man was taken to a private house in the neighborhood, at a place called "Big Spring," or in another report "Burke's Spring," a place ten miles northwest of Dalton, where, shortly after the reception of the injury, it was decided, on the recommendation of Surgeon S. G. Menzies, 1st Kentucky, that excision should be performed. Chloroform having been administered, Surgeon Nathan W. Abbott, 86th Illinois, made an incision five inches in length, commencing two inches above the trochanter major. After dissecting aside the muscular attachments and removing many fragments of the neck and trochanteric portions of the femur, the shaft of the bone was smoothly divided by the chain saw at a point an inch or a little more below the lesser trochanter. Then, with a straight bistoury, the capsular and round ligaments were divided, and the fractured head of the femur was exarticulated. The wound was then approximated by sutures and adhesive strips. The patient rallied satisfactorily from the shock of the injury and operation, and his condition was encouraging on the following morning, when the Union forces retired, sending all the wounded who could be moved to the hospitals at Chattanooga. Private Dempsey alone was left at Big Spring. On the evening of February 26th Surgeon Menzies sent Assistant Surgeon P. F. Ravenot, 73th Illinois, with a cavalry escort from General Cruft's camp, to Big Spring, a distance of five miles, to learn of Private Dempsey's condition, and, if possible, to bring him off. The escort was dispersed and Dr. Ravenot was captured. The fate of Dempsey could not be definitely ascertained. He is dropped from the rolls of his company as "missing in action at Buzzard Roost Gap." Dr. Abbott afterwards heard, indirectly, that Dempsey survived the operation four or five weeks; but was not satisfied that this information was reliable. That the case had a fatal termination there can be no doubt. The excised portions of bone were preserved by Dr. Barnes, of Centralia, Illinois, who was present at the operation. A statement has been received from Brevet-Major E. B. Atwood, 16th Infantry, that he had learned from parties who attended Private Dempsey after he was wounded that he died on February 28, 1864, at the house of a Mr. Rogers, ten miles northwest of Dalton, Georgia.

CASE 211.—Private *T. J. Hobson*, Co. H, 32d Tennessee, aged 23 years, was wounded at Kenesaw Mountain, June 24, 1864, by a conoidal musket ball, which struck the femur and comminuted the neck and trochanters. The fracture extended within the capsular ligament. The shock was very great. The patient was seen by Surgeon J. F. Grant, P. A. C. S., who found that amputation was not practicable except at the hip joint, and deemed it expedient to undertake the operation of excision, as giving, in his judgment, the best chance for recovery. The army was then retreating, and if the patient was removed to the rear it was doubtful if surgical relief could be had. Accordingly, about twelve hours after the reception of the injury, the patient being placed under the influence of chloroform, Dr. Grant proceeded to operate, by making a linear incision ten inches long on the outside of the thigh over the trochanters. The articulation was exposed, the capsular ligament divided, and the head of the bone enucleated. The shattered fragments were then removed, and the shaft of the femur was divided by a straight saw just below the trochanter. The loss of blood was slight. Immediately after the completion of the operation the patient was placed upon a box-car and transported forty miles over a very rough road to the rear. Reaction was never complete, though the patient lingered three days, and died on June 27, 1864.

CASE 212.—Lieutenant John A. McGuire, Co. I, 148th Pennsylvania, was wounded on May 12, 1864, at Spottsylvania, by a musket ball, which smashed the trochanters and neck of the right femur. He was carried to the hospital of the 3d division of the Ninth Corps, where, after an exploration of the wound under chloroform and a consultation of the senior surgeons of the division, it was determined to excise the injured bone. The head, neck, and trochanters were accordingly removed through a longitudinal incision by Surgeon George W. Snow, 35th Massachusetts. The patient died on May 15, 1864.

CASE 213.—Private *O'Rourke*, 18th Mississippi, aged 24 years, healthy and of fine constitution, was wounded at the Wilderness, May 6, 1864, by a musket ball, which entered the right thigh a little behind the trochanter, shattered the neck of the femur, and lodged. There was little injury to the soft parts, and the important vessels and nerves were unharmed. He was taken to a field hospital, and his injury was examined under chloroform, by Surgeon J. T. Gilmore, Chief Surgeon, 1st division, Longstreet's Corps. The limb was everted and shortened, the fracture appeared to be confined to the epiphysis, and there was no bleeding. Believing that removal of the injured bone offered the best chance of preserving life, Surgeon Gilmore proceeded to excise the head and neck of the femur. A curvilinear incision four or five inches long, with its convexity backward, was carried downward from a point a little above and behind the trochanter, and was made to pass through the entrance wound. The muscles inserted in the trochanter were then divided, the head was readily disarticulated, and the femur was then smoothly divided through the trochanters by a chain saw. The operation was accomplished with the loss of but little blood. Yet the patient did not react, but gradually sank, and died May 9, 1864.

CASE 214.—Private Thomas G. Pease, Co. B, 117th New York, was wounded October 28, 1864, near Fair Oaks Station. The trochanters and neck of the right femur were shattered by a musket ball, which lodged against the head in the cotyloid cavity. The soft parts were not injured badly, and it was determined by surgeons on duty at the field hospital of the Tenth Corps that excision of the upper extremity of the femur was expedient. The operation was performed, a few hours after the reception of the injury, by Surgeon N. Y. Leet, 76th Pennsylvania. The patient died on October 29, 1864.

CASE 215.—Sergeant James M. Tolman, Co. H, 18th Wisconsin, aged 30 years, was wounded May 14, 1863, near Jackson, Mississippi, by a conoidal musket ball, which comminuted the head and neck of the left femur, lodging, and producing fissures which extended about two inches below the lesser trochanter. The important nerves and vessels of the region and the walls of the pelvis had escaped injury. The patient was a somewhat cachectic subject, debilitated by malarial disorders. It was deemed that the gravity of the injuries of the upper extremity of the femur rendered operative interference imperative. About twenty-four hours after the reception of the injury, the patient was placed under the influence of chloroform, and Surgeon Henry S. Hewit, U. S. V., exarticulated the head of the femur. The incision commenced a little above and anterior to the trochanter major and extended downward in a curved direction with the convexity backward, and passed through the wound of entrance. The splintered fragments of the head and neck and the ball were removed, and then the fissured upper extremity of the shaft was sawn two and a half inches below the lesser trochanter. The operation was well borne, and the patient was removed the same day to a hospital in the city of Jackson, where he was supplied with every comfort and provided with the most careful attendance. He did apparently well until the third day, when he began to sink, the wound from this time forward exhaling a faint cadaveric odor. He died four days after the operation, May 19, 1863.

CASE 216.—An unknown private soldier of the Fifth Corps, Army of the Potomac, was wounded in the engagement at Laurel Hill, near Spottsylvania Court House, on May 10, 1864, by a musket ball, which fractured the trochanteric portion of the left femur. He was conveyed to the field hospital of the Fifth Corps, at Cassin's, on the Block House road. He was placed under the influence of chloroform, and the head, neck, and trochanters of the left femur were excised. Assistant Surgeon J. S. Billings, U. S. A., saw him on the following morning, when he appeared to be in a comfortable condition. Dr. Billings recollects that he was a young and healthy looking man. The attendants mentioned the character of the operation and the name of the operator, but Dr. Billings cannot recall these particulars. On revisiting the hospital three days subsequently, Dr. Billings learned that the patient had died on that morning, May 13, 1864.

CASE 217.—An unknown soldier of the Eighteenth Corps was wounded, in the assault on the enemy's intrenched lines at Cold Harbor, June 3, 1864, by a fragment of shell, which completely comminuted the trochanter and neck of the right femur. Shortly after the reception of the injury he was conveyed to the field hospital of the Eighteenth Corps, and immediately anæsthetized and examined. Excision of the head, neck, and trochanters of the right femur was then practised. Assistant Surgeon Billings, U. S. A., saw the patient soon after the operation, and observed that he had rallied encouragingly, and was in a comparatively comfortable condition. On June 7th the wounded of the Eighteenth Corps were placed in wagons and sent to the rear. Dr. Billings visited the hospital with a view of preventing the removal of this patient, but was informed by the director of transportation that the man had died the previous night, June 6, 1864.

CASE 218.—A Confederate private soldier was wounded at the battle of Fredericksburg, December 13, 1862, by a fragment of shell, which struck the trochanter of the right femur and fractured it and the neck of the bone, and lacerated the soft parts, but without injuring any of the important vessels or nerves. He was conveyed to a field infirmary, where, a few hours after the reception of the wound, he was placed under the influence of chloroform, and Surgeon Hunter McGuire, Medical Director of Jackson's Corps, having ascertained the extent of the injury, decided that although the lesions of the soft parts rendered the case an unpromising one, yet excision was the only resource that offered any hope, and proceeded to excise the head, neck, and trochanters, dividing the shaft just below the trochanter minor with a chain saw. The wound was left open; the limb placed in a comfortable position by means of pillows, without splints, and the patient was treated at the temporary hospital at which the operation was performed. Notwithstanding the most careful attention to the after-treatment, he succumbed two or three days after the operation.

CASE 219.—A Confederate soldier of Kershaw's South Carolina Brigade was wounded at the battle of Chancellorsville, May 3, 1863, by a musket ball which shattered the neck of the femur. It having been decided, after an examination of the wound under chloroform, that the case was a favorable one for the operation of excision, the important nerves and vessels being intact, and the injury limited mainly to the neck of the bone, the operation was performed by Surgeon James, 16th South Carolina, on the day after the reception of the wound. The patient died May 6, 1863.

In a second category are placed nine cases of primary excision at the hip which resemble each other in that in each the operations were fairly indicated and offered favor-

able prospects of success. The patients, for the most part, were robust soldiers, and the lesions were limited to shot fracture of the upper extremity of the femur. All made a struggle for existence, several lived three or four weeks and one for sixty days, and the fatal results were due, in several instances, to the imperative military exigencies that necessitated the removal and inopportune and disastrous transportation of the patients.

CASE 220.—Private Robert Cole, Co. B, 29th Connecticut (colored troops), was wounded near Fair Oaks, October 27, 1864, by a musket ball, which shattered the upper extremity of the right femur without injury to any important vessels or nerves. He was conveyed to the hospital of the Tenth Corps, where the wound was explored, and it was decided to excise the head, neck, and trochanters of the femur. The operation was performed by Surgeon C. M. Clark, 39th Illinois, a few hours after the reception of the injury, by a longitudinal incision over the trochanter major, and division of the superior portion of the shaft by a chain saw. Dressings to secure the immobility of the limb were applied, and the patient was removed to the base hospital of the Army of the James, at Point of Rocks, where he was received on October 28th, and died on October 29, 1864.

CASE 221.—Private John Coon, Co. C, 60th Indiana, aged 20 years, a robust man, was wounded at Arkansas Post, January 11, 1863, by a conoidal musket ball, which entered the right buttock and passed forward and outward, striking the femur on the inter-trochanteric line and comminuting the neck and upper part of the shaft of the bone. A few hours after the reception of the injury the patient was conveyed to a hospital steamer, and a consultation was held, at which it was determined to excise the injured portions of bone. The loss of blood which had taken place and the patient's exposure to inclement weather were regarded as very unfavorable circumstances, but it was considered that on the whole an excision was the best thing to be done. An ounce of brandy and other restoratives were administered, and half an hour subsequently the wounded man was placed under the influence of chloroform, and Surgeon Milton T. Carey, 48th Ohio, made a semi-circular incision, beginning two inches above the prominence of the great trochanter downward in the direction of the shaft of the femur. The muscular attachments were then divided, and the capsular ligament freely incised. Some difficulty was then experienced in dividing the ligamentum teres; but this was finally accomplished, and the head of the femur removed. The extent of splintering having been determined, the shaft was sawn below the trochanter minor by means of a chain saw. The edges of the wound were then brought together, and a retentive apparatus was applied. After the operation the patient seemed much prostrated, but he rallied after a few hours, and was conveyed on the hospital transport D. A. January to Memphis, Tennessee, and placed in the military general hospital at that place, where he died ten days subsequently, January 21, 1863.

CASE 222.—Private *J. W. Epton*, Co. I, 5th South Carolina, was wounded at Deep Bottom, August 16, 1864, and was conveyed to the third division of the Jackson Hospital at Richmond. Surgeon J. G. Cabell, in charge, entered on the hospital register, page 214: "A minié ball penetrated the right hip joint, on account of which a primary resection of the head and neck of the femur was practised. The patient sank, and died September 2, 1864."

CASE 223.—Private Timothy Greely, Co. C, 74th New York, aged 20 years, was wounded October 5, 1861, by a round musket ball, which entered near the fold of the left natis, struck the left femur at the digital fossa, splintered the neck into the articulation, and made its exit outside the vessels anteriorly. He was conveyed to the E street Infirmary, Washington, on the same day. A stream of blood and another of clear and pellucid synovia issued from the wound of exit. There was but little constitutional irritation, the pulse was but slightly depressed, and the patient congratulated himself on having escaped with what he regarded as a slight injury. On the morning of October 6th Assistant Surgeon John W. S. Gouley, U. S. A., assisted by Surgeon C. H. Laub, U. S. A., Assistant Surgeon C. B. White, U. S. A., Surgeon T. Sim, and Assistant Surgeon H. E. Brown, proceeded to operate. Insensibility having been induced by chloroform, Dr. Gouley made an incision seven inches long, commencing above and behind the trochanter major and continued downward in the axis of the limb. The neck of the bone was found to be badly shattered, but the fracture did not extend to the shaft. A section through the great trochanter and base of the neck was made with the chain saw. The head of the bone was then disarticulated and removed, and the fragments of the neck were extracted. There was very little loss of blood. The wound having been approximated and dressed simply, the patient was put to bed, and the limb was kept in position by pads and cushions. Surgical fever set in soon after the operation; pyæmia was developed, and the patient gradually sank, and died on October 12, 1861. His friends would not permit an autopsy. The pathological specimen and Dr. Gouley's notes of the case were destroyed in the conflagration which shortly afterwards consumed the Infirmary.

CASE 224.—Sergeant Samuel Grimshaw, Co. H, 6th New York Cavalry, aged 31 years, was wounded at Cedar Creek, October 19, 1864, by a fragment of shell, which, after lacerating the scrotum, entered at the upper inner part of the left thigh near the femoral artery, making a wound one and a half inches in length, and passing upward and backward, shattered the head and neck of the femur and produced fissures extending four and a half inches in the shaft, and lodged in the acetabulum. The shock to the nervous system was great. The patient was desponding, and he complained of severe pain. He was conveyed to a field hospital, and two hours after the reception of the injury he was placed under chloroform, and Surgeon A. P. Clark, 6th New York Cavalry, made a straight incision seven inches in length over the trochanter major, and excised the head and four and a half inches of the shaft of the femur. The wound was then dressed, and the limb was supported by pasteboard splints. On the following day no bad symptoms were observed. Beef essence and stimulants were freely given, and afterwards sulphate of morphia was administered. He was removed to the Sheridan Field Hospital at Winchester on October 20th, and there died on November 5, 1864.

CASE 225.—Private *B. C. Johnston*, Co. B, 56th North Carolina, Ransom's Brigade, was wounded on the night of the 17th of June, 1864, in front of Petersburg, by a conoidal ball probably, in the right thigh. The ball entered on the inner aspect of the limb and passed obliquely upward and outward, producing a comminuted fracture of the neck of the femur and driving the fragments of bone into the surrounding tissues. The shaft of the bone was not shattered, and, as the man was very much

worn and exhausted, as most of the Confederate troops were at that time, it was considered advisable to perform resection of the head and neck of the femur, as offering a better chance of recovery than amputation. The operation was performed on June 18th, twelve hours after the reception of the wound, and the bone was sawn through the trochanters. He bore the operation well, and, although weak, was hopeful. He was sent to the Fair Grounds Hospital, from which he was removed in a few days, placed in a tent, and attended by Surgeon Ladd, 56th North Carolina, and Dr. C. J. O'Hagan. He survived the operation two months, and succumbed at last to suppuration, caused by the want of proper food and stimulants, and the general prevalence of pyæmic infection, which at that period intervened in nearly all the surgical cases in the neighborhood of that hospital. To this account Dr. J. D. Jackson adds: "I recollect very distinctly of being present at the operation of Dr. Ladd, being then of the same division with him, but not of the same brigade. It was on the 18th or 19th of June, 1864, that it was done, the place being an unfinished brick church in the centre of Petersburg, which we were then occupying as an hospital. There were also present some four or five other surgeons, among whom I recollect Surgeon C. J. O'Hagan, Dr. Wilson, of Virginia, then the senior Surgeon of Ransom's Brigade, Dr. Luckie, of the same brigade, and, if I mistake not, Dr. R. L. Brodie, then Medical Director of General Beauregard's army, was among the number. The man operated upon was of Dr. Ladd's own regiment; his age, and any other personal peculiarities, I have forgotten, though I think he was young and comparatively robust. The wound had apparently been done by a musket ball, and the range of the wound was, I think, from the inner and upper aspect of the thigh, and nearly transversely through, ranging slightly upward, the aperture of exit being over the trochanter major. If I recollect aright, the trochanter was torn off and most of the neck of the femur shattered to fragments, the shaft of the femur being entirely separated from the head. Chloroform was given, and Dr. Ladd operated by making a slightly curvilinear incision over the acetabulum and trochanter—the aperature of the wound being in its line—cut down upon the head of the femur, exarticulated and removed it, and cut off a sharp fragment of the remaining end of the femur. The difficulty of performing the operation seemed to be small. The hæmorrhage was trifling. I do not recollect that I saw the patient again, he being sent off to the General Hospital at what was then known as the "Fair Grounds Hospital," situated in the suburbs of Petersburg. But I further remember distinctly of hearing Dr. Ladd, Dr. O'Hagan, and probably others of Ransom's Brigade speaking of his death, which was on the sixtieth day after the operation, and which all agreed at the time in ascribing to want of good food in proper quantity. Owing to the scarcity of our supplies, and the immense number of wounded men then crowding the city in consequence of the battles fought in front of Petersburg on the 17th, 18th, and 19th of June, food really proper for wounded men was not obtained, and anything like delicacies were out of the question."

CASE 226.—Private Edward A. McDonald, Co. F, 149th Pennsylvania, aged 31 years, a robust, athletic man, was wounded on August 20, 1864, on the Weldon Railroad. A conoidal musket ball entered the upper anterior part of the right thigh and lodged in the head of the femur, after splintering its neck. He was carried to the hospital of the 1st division of the Fifth Corps, and placed under the influence of chloroform a few hours after the reception of the injury, and Surgeon F. C. Reamer, 143d Pennsylvania, assisted by Surgeon Thomas, 119th Pennsylvania, and others, proceeded with the operation. A V-shaped incision, arranged to traverse the entrance wound, exposed the muscular attachments of the neck and trochanter. These being divided, with the capsular and round ligaments, the head of the femur was exarticulated. Fragments of the neck were extracted, and then the femur was sawn through the trochanteric ridge by the chain saw. The wound was then partly closed by sutures and adhesive plasters, a pledget of lint being inserted at the lower end, and the limb was bandaged and suspended by a Smith's anterior splint. Little loss of blood had been incurred, and the patient reacted and his condition appeared hopeful. Two days afterwards it was deemed necessary to remove the severely wounded from the advanced position of the Fifth Corps, and McDonald was sent in an ambulance wagon several miles, over a rough road, to the railroad to the hospital at City Point. There he remained three days, and was placed on a hospital transport and sent to Philadelphia, entering Broad and Cherry Streets Hospital August 27th. The injured limb was extended by means of a weight and pulley, concentrated nourishment and stimulants were administered, with quinia and opium. August 31st, symptoms of pyæmia were noted and the complication made rapid progress. Death took place September 4, 1864. At the autopsy large metastatic foci were observed in both lungs.

CASE 227.—Private Charles Morrison, Co. C, 185th New York, was wounded on the Quaker Road, south of Petersburg, on March 29, 1865. A conoidal musket ball struck the outside of the left thigh, fractured the trochanter, and separated the neck from the shaft. In less than two hours after the reception of the injury he was placed on the operating table at the field hospital of the 1st division of the Fifth Corps, and his wound was examined while he was under the influence of chloroform. He was a robust man, in the best health. In the judgment of the operating staff, the case was a very favorable one for the operation of excision. Surgeon William Fuller, 1st Michigan, was requested to perform the operation, and proceeded with it without delay. He entered his knife an inch above the great trochanter and made an incision three and a half inches in length, divided the muscular attachments, and readily exarticulated the head of the femur. A fissure was found to extend downwards half an inch below the trochanter minor. The shaft was divided by a chain saw at this point. The ball could not be found, but, from the direction of its track, it was the opinion of the operator and his colleagues that it had entered the pelvis through the obturator foramen. There was scarcely any hæmorrhage during the operation, no artery requiring ligation or torsion. A tent was introduced into the wound, which was then approximated by two sutures and covered by a compress dipped in cold water. A full dose of morphia was then administered, and the patient was made as comfortable as possible in a bed in a hospital tent. In the middle of the night Surgeon Fuller returned to the hospital to visit his patient, but found that he had been removed to City Point, in compliance with orders from a superior authority. Dr. Fuller was subsequently informed by Surgeon Joseph Thomas, 118th Pennsylvania, that the man died on the way to the base hospital, about twelve hours after the operation. There was some hæmorrhage a few hours after the operation, but it was not considerable. The report of the patient's death was premature. The records of the City Point Hospital show that he was received there, and survived until April 26, 1865.

CASE 228.—A Confederate private soldier of Ewell's Corps was wounded at the battle of the Wilderness, May 5, 1864, by a conoidal musket ball, which broke the neck of the left femur into several fragments and lodged in the bone at the junction

of the head and neck. A few hours after receiving his wound he was placed under the influence of chloroform at a field hospital, and was examined by Surgeon Hunter McGuire, the Medical Director of the Corps, who decided that the case was well adapted for the operation of excision of the head of the femur, and proceeded to remove, through a longitudinal incision, the head and shattered fragments of the neck, and to smooth off with a saw the jagged upper extremity of the shaft. The operation was accomplished with but trifling hæmorrhage. It is Dr. McGuire's impression, but, owing to the loss of his notes he cannot state positively, that in the subsequent rapid movements of the army it was necessary to send the patient to the rear, and besides the disadvantages of removal, he failed to receive such nourishment and careful treatment as his case demanded. He died of pyæmia, May 22, 1864. As in the majority of the primary field excisions the shattered epiphysis removed was not preserved.

Ten fatal cases of primary excision at the hip are placed in a third category. These ten might almost be set aside in estimating the value of the operation, inasmuch as the interference would hardly have been undertaken, had the extent of the lesion been fully ascertained. Four of the cases were complicated by penetration of the pelvic cavity, inducing hopeless peritonitis; four were prostrated from excessive loss of blood; in two instances extensive longitudinal splintering of the shaft of the femur forbade the anticipation of a favorable result.

CASE 229.—Private *J. T. Goode,* Co. K, 6th Virginia, aged 21 years, was wounded before Petersburg, July 31, 1864, by a conoidal musket ball, which fractured the upper extremity of the left femur. A few hours after the reception of the injury he was anæsthetized by a mixture of chloroform and ether, and the wound being explored excision was decided upon. Surgeon G. S. West, C. S. A., proceeded to perform the operation, assisted by Dr. W. L. Baylor and others. Upon making a linear incision in the axis of the limb and exposing the fracture, it was found that it extended longitudinally much lower on the shaft than was anticipated. Dr. Baylor reports that one of the surgeons present thinks that fully one-third of the femur was excised. The patient never fairly rallied from the shock of the operation, but he lingered until August 2, 1864, when he died. Dr. Baylor adds that the circumstances were very unfavorable, the patient being fully nourished and nosocomial gangrene at the time pervading the surgical wards.

CASE 230.—Private John McCulloch, aged 35 years, a recruit at the depot for volunteers at Camp Dennison, Ohio, was wounded on August 30, 1861, by the accidental discharge of a musket. The ball, taking effect at the distance of a few yards only, severely shattered the upper part of the femur and lacerated the soft parts extensively. The patient was conveyed to St. John's Hospital, in Cincinnati, and on arriving was greatly depressed by loss of blood. Professor George C. Blackman determined that removal of the shattered bone offered the best resource for the preservation of life, and, the patient having been rendered insensible by chloroform, excision of the head, neck, and trochanters was practised without delay, through a vertical incision on the exterior of the thigh. The patient died August 30, 1861, four hours after the completion of the operation. This was the first excision at the hip for shot injury in this country.

CASE 231.—Private *G. W. Mayo,* Co. B, 25th Battalion Virginia Reserves, was wounded at the affair between Yellow Tavern and the outer defences of Richmond, Virginia, May 12, 1864, by a conoidal musket ball, at short range, which entered the right buttock and passed forward and outward through the thigh, striking the femur between the trochanters, and producing very extensive splintering of the neck and shaft. He was admitted to the Receiving and Wayside Hospital, at Richmond, early the next day, and his wound being examined under chloroform, Surgeon Charles Bell Gibson, C. S. A., determined to proceed at once with the operation of excision of the head and upper extremity of the femur. The injured bone being exposed by a long straight incision, the muscular and ligamentous attachments were divided, and the head of the femur was disarticulated. Numerous detached fragments were then removed, and the shaft of the femur was sawn at a point five or six inches below the trochanter minor. The operation was rapidly accomplished, but the shock, added to the depression already existing from the injury, was such that the patient did not react. He died at 9 o'clock A. M. on May 15, 1864, about forty-five hours after the operation. The pathological specimen was preserved, and has lately been contributed to the Army Medical Museum by Dr. W. F. Richardson. It is represented in the annexed wood-cut (FIG. 48).

FIG. 48.—Shot comminution of neck and trochanters of left femur. *Spec.* 5498.

CASE 232.—At the assault on Knoxville, Tennessee, on November 16, 1863, a soldier of a Michigan cavalry regiment was wounded and made a prisoner. He was a man about eighteen years of age, five feet eight inches in height, with light hair and blue eyes, and was in robust health when he received the injury. A minié ball entering about the centre of the nates, passed forward, shattering the head and upper part of the neck of the femur, but did not injure the acetabulum. No hæmorrhage of importance followed the wound. It was considered that the case demanded excision of the head of the femur, and the operation was performed on the day of the reception of the injury by Surgeon J. S. D. Cullen, P. A. C. S. "The operator made his incision posteriorly, directly through the thickest part of the gluteal muscles, on a line parallel with the *os femoris,* instead of laterally. In making his incision, which, at the least calculation, was ten inches in length, he cut the gluteal artery near its point of exit from the pelvis." The artery was ligated finally, though not until there had been much loss of blood. The head and neck of the femur were then excised. "When the siege was abandoned," another report states, "General Longstreet retired to Russellville, and this patient was left behind. I am positive that he could not have recovered, for the suppuration that followed the operation was immense, and he was suffering from hectic fever when I last saw him, some six days after the operation." There can be but little doubt that the patient referred to in this account was Private Isaac Melcar, Co. A, 8th Michigan Cavalry, aged 18 years, who was found abandoned on the retirement of the Confederate army from Knoxville, and

was taken to hospital No. 2, in that city, and entered as a case of "gunshot fracture of left hip." No other Michigan cavalry soldier is reported at the period referred to with this or any similar wound. This man died on December 2, 1863. The register of the Knoxville Hospital gives no particulars of the case.

FIG. 49.—Fissuring of upper extremity of the right femur. *Spec.* 5499.

CASE 233.—Private *J. J. Phillips*, Co. G, 61st Virginia, was wounded on the second day of the battle of the Wilderness, May 6, 1864, by a conoidal musket ball, which entered at the posterior upper portion of the left thigh, fractured the femur, and lodged. He was immediately conveyed to Richmond by rail, and was admitted to the Receiving and Wayside Hospital on May 7th. The wound was at once thoroughly explored under chloroform, and excision of the shattered bone was decided on. Surgeon Charles Bell Gibson, C. S. A., performed the operation. A long vertical incision over the trochanter major exposed the injured bone. It was found that the ball had produced extensive longitudinal splintering and had itself split, a small fragment lodging in the medullary canal, while a larger portion had buried itself in the gluteal muscles about two inches from the point of impact upon the bone. The muscles inserted into the trochanter having been divided, the head of the femur was exarticulated, and the upper extremity of the shaft was smoothed off with a saw. The operation was accomplished without much hæmorrhage, and the patient rallied promptly from the shock. He had an anodyne, and passed a good night, and, on the following day, May 8th, he appeared to be doing well. On the 9th, however, there was much constitutional irritation, and on the morning of the 10th it was apparent that the man was sinking. He died at 4 o'clock A. M., May 11, 1864. The pathological preparation was contributed by Dr. Richardson to the Army Medical Museum, and is a fine illustration of the characteristic longitudinal fissuring produced in the femur by conoidal balls. It is represented in the adjoining wood-cut (FIG. 49).

In a letter dated Chicago, September 18, 1869, Dr. C. M. Clark, late Surgeon 39th Illinois Volunteers, reports the following case of excision at the hip:

CASE 234.—"Private *C. Raines*, Co. E, 25th North Carolina, was wounded June 2, 1864, by a conoidal ball, which entered the right thigh at the upper and outer third, near the great trochanter, passing obliquely downward and inward, and making its exit near the junction of the middle with the upper third of the femur. This man was not seen until eight hours after the wound was received, being among the last to be brought from the field. When he reached the operating table he was almost exsanguinated and pulseless, having lost a large amount of blood. After free administration of milk punch and beef tea, with comfortable rest for two hours' time, he was placed on the operating table at 7 o'clock P. M., and the following operation performed: Chloroform was given (which added greatly to the stimulation of the system—pulse 80 and full), and a longitudinal incision made from the great trochanter down to the extent of six inches. The femur was found to be extensively comminuted, and some sixteen fragments were removed, leaving the periosteum behind. There was diffused ecchymosis with clots throughout the extent of the fracture. The lower fragment was turned out and smoothly sawn off, and then attention paid to the upper portion, which was found comminuted within the capsule to such a degree as warranted the removal of the head of the bone, which was done by extending the incision upward one inch, opening the capsular ligament, turning head of bone out and dividing the ligamentum teres. The parts were then thoroughly cleansed and brought together with eight interrupted sutures. Applied strip of lint to the wound, wet with solution of tannic acid and collodion, then bandaged with spica turns about hip and splint, etc. He rallied well from the operation and passed a comfortable night at the hospital. In the morning he was taken, per hospital transport, to the Chesapeake Hospital, and I have no knowledge of the case since that time, but presume the records of that hospital will furnish the result. The bone removed below the trochanter major measured three and a half inches." This case has been identified as that of "*C. C. Kaines*, a rebel prisoner," aged 23 years, who was reported by Assistant Surgeon E. McClellan, U. S. A., as having been admitted to hospital at Fort Monroe, June 4, 1864, with "shell wound of right side and abdomen," and as having died the same day of "exhaustion."

CASE 235.—Captain Thomas R. Robeson, 2d Massachusetts, aged 24 years, an athletic man, was wounded July 3, 1863, at Gettysburg, his regiment having become warmly engaged under a musketry fire at short range. A rifled musket ball struck him over the right trochanter major, shattering the neck and head of the femur, and, as was subsequently ascertained, fractured the pelvis and penetrated its cavity. He was carried a short distance to the rear, where the stretcher-bearers became exhausted and laid him down. Sergeant Francis O'Doherty, of his regiment, coming shortly afterwards wounded to the rear, impressed some stragglers and had the wounded man conveyed to a field station of medical officers of the Twelfth Corps. In the afternoon he was brought into the Twelfth Corps hospital, and was examined by Surgeon John McNulty, U. S. V. The sufferings of the patient were intense, and he urgently demanded some operative interference for his relief. Although the prospect was very discouraging, it was decided to comply with his request. An exploration of the wound indicated that there was some injury of the pelvic wall. The patient was placed under the influence of chloroform very soon after his admission to the hospital, and a few hours subsequent to the reception of the injury Dr. McNulty made an incision over the trochanter major six inches long, passing through the wound of entrance and continued downward in the axis of the limb, turned out the shattered superior extremity of the femur and sawed the bone just below the trochanters. The fragments of the head and neck were then removed. There was more bleeding in this than in Dr. McNulty's other operations of excision of the head of the femur, yet the hæmorrhage could not be called profuse. The patient survived the operation fourteen hours. During this interval he appeared to be unconscious.

CASE 236.—It has not been possible to learn the name and military description of the subject of this operation. He was a private soldier of the First Corps, and a Frenchman, for the operator recalls the broken English in which he begged for the operation, and expressed his relief and thanks after it was performed. He had a terrible comminution of the upper extremity of the left femur, inflicted by a fragment of shell at the battle of Antietam, September 17, 1862. Surgeon John McNulty, U. S. V., excised the head and neck of the femur, five hours after the reception of the injury, through a vertical incision six inches long,

under chloroform. As in two other operations performed by Dr. McNulty, it was found that the lesions extended into the pelvis. Consequently there could be little or no hope of a successful result. This patient survived the operation only ten hours.

CASE 237.—Private —— ———, of the First Corps, was wounded at the second battle of Bull Run, August 30, 1862, by a conoidal musket ball, which entered the left hip below and in front of the trochanters, and fractured the femur at the junction of the head and neck. He was conveyed to the hospital of General King's division of the First Corps in the brick house which had been occupied as the rebel headquarters at the first battle of Bull Run. The prostration from shock was great, yet it was thought that exarticulation of the femur was the only resource, and that excision would be less hazardous than amputation. Accordingly, fifteen hours after the reception of the injury, Surgeon John McNulty, U. S. V., proceeded to excise the head and neck of the left femur through a vertical incision on the exterior of the limb about six inches in length, the patient being under chloroform. On dividing the round ligament to enucleate the head of the bone, it was discovered that the ball had penetrated the pelvic cavity through the lower portion of the acetabulum. The femur was sawn through at the junction of the shaft and neck by a narrow-bladed saw. After the removal of the shattered fragments of bone, the patient suffered much less pain. There were no symptoms of peritonæal inflammation at the date of the operation, but they were subsequently developed. The patient died August 31, 1862.

CASE 238.—Private —— ———, was wounded on August 28, 1862, in the engagement between General Rufus King's division of the First Corps and the advance of General Jackson's column on the Washington turnpike, near Gainesville. A conoidal musket ball had splintered the neck and trochanters of the left femur, and was supposed to have lodged about the acetabulum, though the operator discovered in the sequel that it had penetrated into the cavity of the pelvis. The symptoms of shock were very grave and the prognosis very unfavorable; but the chief medical officer of the division, Surgeon Peter Pineo, U. S. V., determined to remove the upper extremity of the femur. The upper fourth of the femur was excised a few hours after the reception of the injury. The excision was done under chloroform, with little apparent loss of blood, through a vertical incision on the outside of the limb. The femur was sawn about two inches below the lesser trochanter. It was now discovered that the ball had passed through the innominatum, and that internal hæmorrhage was going on. During the night of August 28th General King's division was driven back to Manassas, and this patient with other wounded fell into the hands of the enemy. It is probable that he survived but a very short time. Dr. Pineo secured the specimen, and it is preserved in the Surgical Section of the Army Medical Museum as No. 71. It is figured at page 233 of the Catalogue of the Surgical Section, and another view is given in the accompanying wood-cut (FIG. 50). The trochanter major is separated into five fragments, and a long oblique fissure produces a complete solution of continuity in the shaft of the femur.—(*Circ.* 6, S. G. O., 1865, p. 62, CASE 5, and *Circ.* 2, S. G. O., 1869, pp. 21, 132.)

FIG. 50.—Perforation of trochanter and fissuring of the shaft of left femur. *Spec.* 71.

The successful primary excision at the hip and thirty-two unsuccessful operations will now be concisely tabulated in alphabetical order for convenience of comparison and reference:

TABLE XI.

Summary of Thirty-three Cases of Primary Excision at the Hip after Shot Injury.

NO.	NAME, AGE, AND MILITARY DESCRIPTION.	DATE OF INJURY.	NATURE OF INJURY.	DATE OF OPERATION.	OPERATION AND OPERATOR.	RESULT AND REMARKS.
1	*Cannon*, —, Pt., A, 49th Georgia, age 24.	May 5, 1864.	Conoidal ball comminuted left femur one inch below trochanter major and lodged.	May 6, 1864.	Head, neck, and upper extremity of shaft, through incision in wound six inches long, by Surg. J. J. Dement, P.A.C.S.	Recovered, February, 1865, shortening three inches; limb useless for locomotion. Died November 23, 1865, diphtheria. *Circ.* No. 2, pp. 26, 133.
2	Barber, F. M., Capt., H, 16th Connecticut, age 32.	Sept. 17, 1862.	Shot shattering trochanters and neck of right femur.	Sept. 18, 1862.	Head, neck, trochanters, and fract. upper extremity, thro' straight incision four ins. long, by Surg. M. Storrs, 8th Conn.	Surgical fever. Died September 20, 1862. *Circ.* 2, pp. 22, 133.
3	*Beard, C.*, Pt., 12th Mississippi.	Aug. 23, 1864.	Conoidal ball fractured head and neck of right femur and lodged in acetabulum.	Aug. 23, 1864.	Head and femur, just above lesser troch., thro' angular incision, by Surg. A. A. White, 8th Maryland.	Died Aug. 25, 1864. *Spec.* 1410, A. M. M. *Circ.* 2, pp. 31, 134, and *Circ.* 6, p. 70.
4	Brown, E. T., Sergeant, C, 21st Massachusetts, age 30.	July 23, 1864.	Fragment of bomb fractured upper extremity of left femur, five inches.	July 23, 1864.	Head and broken extremity of shaft, thro' longitudinal incision, by Surg. W. V. White, 57th Massachusetts.	Died July 27, 1864. *Circ.* 2, pp. 30, 134.
5	Cole, R., Pt., B, 29th Connecticut.	Oct. 27, 1864.	Musket ball shattering upper extremity of right femur.	Oct. 27, 1864.	Head, neck, trochanters, and portion of shaft by longitudinal incision over troch. major, by Surg. C. M. Clark, 39th Ill.	Died October 29, 1864. *Circ.* 2, pp. 33, 134.
6	Coon, J., Pt., C, 60th Indiana, age 20.	Jan. 11, 1863.	Conoidal ball comminut'g neck and upper part of shaft of right femur.	Jan. 11, 1863.	Head and shaft below troch. minor, through semi-circular incis'n, by Surg. M. T. Carey, 48th Ohio.	Died January 21, 1863. *Circ.* 2, pp. 23, 133.
7	[1] Dempsey, B., Pt., Battery I, 4th Artillery.	Feb. 25, 1864.	Fragment of shell crushing trochanters and neck of right femur.	Feb. 25, 1864.	Head, neck, and shaft an inch below trochanter minor, thro' longitudinal incis. five ins., by Surg. N. W. Abbott, 80th Ill.	Died February 28, 1864. *Circ.* 2, pp. 25, 133.
8	*Epton, J. W.*, Pt., I, 5th S. Carolina.	Aug. 16, 1864.	Conoidal musket ball wound of right hip.	Prim'ry.	Head and neck of right femur.	Died September 2, 1864. *Circ.* 2, p. 120.
9	*Goode, J. T.*, Pt., K, 6th Virginia, age 21.	July 31, 1864.	Conoidal ball fracture upper extremity of left femur.	July 31, 1864.	Head, neck, and nearly one-third of shaft, thro' linear incision, by Surg. G. S. West, C. S. A., and others.	Died August 2, 1864, from shock of operation. *Circ.* 2, pp. 30, 134.

[1] ABBOTT (N. W.), *Cases of Resection*, in *Chicago Medical Examiner*, 1864, Vol. V, p. 612.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
10	[1]Greely, T., Pt., C, 74th New York, age 20.	Oct. 5, 1861.	Round ball splintering neck of left femur into articulation.	Oct. 6, 1861.	Head and fragments of neck, through incision seven inches long, sect. thro' troch. maj. and base of neck, by Ass't Surg. J. W. S. Gouley, U. S. A., and others.	Surgical fever, pyæmia. Died Oct. 12, 1861. *Circ.* 6, p. 62, and *Circ.* 2, pp. 21, 132.
11	Grimshaw, S., Sergeant, H, 6th N. Y. Cavalry, age 31.	Oct. 19, 1864.	Fragm'nt of shell shat'ing head and neck of left femur, fissures extending four and a half ins. in shaft, lodged in acetabul'm.	Oct. 19, 1864.	Head and four and a half ins. of shaft, through straight incision seven inches long, by Surg. A. P. Clark, 6th New York Cavalry.	Died November 5, 1864. *Circ.* 2, pp. 32, 134.
12	[2]*Hobson, T. J.*, Pt., H, 32d Tennessee, age 23.	June 24, 1864.	Conoidal ball fract. neck and trochanters of femur, extend into capsular ligament.	June 24, 1864.	Head and shaft just below trochanters, through linear incision ten inches long, by Surg. J. F. Grant, P. A. C. S.	Reaction never complete. Died June 27, 1864. *Circ.* 2, pp. 30, 134.
13	*Johnston, B. C.*, Pt., B, 56th North Carolina, age 26.	June 17, 1864.	Conoidal ball severing head and portion trochanter major, right femur.	June 17, 1864.	Head and fragments, through curvilinear incision five ins. long, roughened projection of shaft cut off, by Surg. C. H. Ladd, 56th N. C.	Died August 16, 1864, from exhaustion, probably the result of caries and ill-judged diet. *Circ.* 2, pp. 29, 134. EVE (*l. c.*, p. 263).
14	McCulloch, J., Recruit, age 35.	Aug. 30, 1861.	Shot shattering upper part of femur.	Aug. 30, 1861.	Head, neck, and trochanters, through vertical incision, by Prof. G. C. Blackman.	Died August 30, 1861, four hours after operation. *Circ.* 2, pp. 20, 132.
15	McDonald, E. A., Pt., F, 149th Pennsylvania, age 31.	Aug. 20, 1864.	Conoidal ball splintered neck and lodged in head of right femur.	Aug. 20, 1864.	Head, fragments of neck, and shaft, thro' trochanteric ridge, V-incision, by Surg. F. C. Reamer, 143d Penn.	Died September 4, 1864, of pyæmia. *Circ.* 6, p. 70, and *Circ.* 2, pp. 30, 134.
16	McGuire, J. A., Lieut., I, 148th Pennsylvania.	May 12, 1864.	Musket ball smashed trochanters and neck of right femur.	May 12, 1864.	Head, neck, and trochanters, thro' longitudinal incision, by Surg. G. W. Snow, 35th Mass.	Died May 15, 1864. *Circ.* 2, pp. 28, 134.
17	*Mayo, G. W.*, Pt., B, 25th Virginia Reserves.	May 12, 1864.	Conoidal ball fractured neck and shaft of right femur.	May 13, 1864.	Head and shaft, five inches below troch. minor, through straight incision, by Surg. C. B. Gibson, P. A. C. S.	Died May 15, 1864, from shock. *Spec.* 5498, A. M. M. *Circ.* 2, pp. 28. 134.
18	Melcar, I., Pt., A, 8th Michigan Cavalry, age 18.	Nov 16, 1863.	Conoidal ball shattered head and upper part neck of left femur.	Nov. 16, 1863.	Head and neck, thro' incision ten inches long, by Surg. J. S. D. Cullen, C. S. A.	Died December 2, 1863. *Circ.* 2, pp. 25, 133. EVE (*l. c.*, p. 257).
19	Morrison, C., Pt., C, 185th New York, age 21.	Mar. 29, 1865.	Conoidal ball separated neck from shaft of left femur and frack trochanter major, and probably lodged in pelvis.	Mar. 29, 1865.	Head and shaft, half inch below trochanter minor, thro' longitudinal incis'n, by Surg. W. Fuller, 1st Mich.	Hæmorrhage. Died April 26, 1865, irritation and profuse suppuration. *Circ.* 2, pp. 33, 134.
20	*O'Rourke*, —, Pt., 18th Mississippi, age 24.	May 6, 1864.	Musket ball shattered neck of right femur and lodged.	May 6, 1864.	Head, neck, and shaft, through trochanters, curvilinear incis. four inches long, by Surg. J. T. Gilmore, C. S. A.	Did not react. Died May 9, 1864. *Circ.* 2, pp. 27, 133, and EVE (*l. c.*, p. 257).
21	Pease, T. G., Pt., B, 117th New York.	Oct. 28, 1864.	Musket ball shattered trochanters and neck of right femur and lodged in cotyloid cavity.	Oct. 28, 1864.	Upper extremity of femur, by Surg. N. Y. Leet, 76th Penn.	Died Oct. 29, 1864. *Circ.* 2, pp. 32, 134.
22	*Phillips, J. J.*, Pt., G, 61st Virginia.	May 6, 1864.	Conoidal ball, extensive longitudinal splintering of shaft of right femur.	May 7, 1864.	Head and up. extremity, thro' long vertical incis'n, by Surg. C. B. Gibson, C. S. A.	Died May 11, 1864. *Spec.* 5499, A. M. M. *Circ.* 2, pp. 27, 133.
23	*Raines, C.*, Pt., E, 25th N. Carolina, age 23.	June 2, 1864.	Conoidal ball, extensive comminution of shaft and upper portion of right femur within the capsule.	June 2, 1864.	Head, neck, trochanter major, and three and a half ins. of shaft, thro' longitudinal incision six inches long, by Surg. C. M. Clark, 39th Ill.	Died June 4, 1864, exhaustion.
24	Robeson, T. R., Capt., 2d Massachusetts, age 24.	July 3, 1863.	Conoidal ball shattered head and neck of right femur, fractured the pelvis, and penetrated its cavity.	July 3, 1863.	Head, neck, and shaft just below trochanters, thro' incis'n six inches long, by Surg. J. McNulty, U. S. V.	Did not rally. Died July 3, 1863. *Circ.* 2, pp. 25, 133.
25	Talman, J. M., Sergeant, H, 18th Wisconsin, age 30.	May 14, 1863.	Conoidal ball comminuted head and neck of left femur, and lodged in neck; fissures extending down shaft.	May 15, 1863.	Head, neck, and shaft, two and a half inches below lesser trochanter, curved incision, by Surgeon H. S. Hewit, U. S. V.	Died May 19, 1863. *Circ.* 6, p. 66, and *Circ.* 2, pp. 24, 133.
26	Unknown, Pt., 1st Army Corps (a Frenchman).	Sept. 17, 1862.	Fragment of shell comminut'g upper extremity of left femur, lesions extending into pelvis.	Sept. 17, 1862.	Head and neck, thro' vertical incision six inches long, by Surg. J. McNulty, U. S. V.	Survived the operation ten hours. *Circ.* 2, pp. 22, 133.
27	Unknown, Pt., First Army Corps.	Aug. 30, 1862.	Conoidal ball fractured the left femur at junction of head and neck, pen. pelvic cavity.	Aug. 30, 1862.	Head and shaft, at junct'n with neck, vertical incision six ins. long, by Surg. J. McNulty, U. S. V.	Died August 31, 1862, from shock of injury and operation. *Circ.* 2, pp. 22, 132.
28	Unknown, Pt., General R. King's division, First Army Corps.	Aug. 28, 1862.	Conoidal ball splintering neck and trochanters of left femur, and pen. pelvic cavity.	Aug. 28, 1862.	Head and shaft, about two ins. below trochanter minor, vertical incision, by Surgeon P. Pineo, U. S. V.	Patient fell into the hands of the enemy, probably survived but a short time. *Spec.* 71, A. M. M. *Phot. Ser.*, Vol. 1, p. 13, S. G. O. *Circ.* 6, p. 62; *Circ.* 2, pp. 21, 132.
29	Unknown, Pt., Fifth Army Corps.	May 10, 1864.	Musket ball fracturing trochanteric portion of left femur.	May 10, 1864.	Head, neck, and trochanters...	Died May 13, 1864. *Circ.* 2, pp. 28, 133.
30	Unknown, Pt., Eighteenth Army Corps.	June 3, 1864.	Fragment of shell comminuted trochanter major and neck of right femur.	June 3, 1864.	Head, neck, and trochanters...	Died June 6, 1864. *Circ.* 2, pp. 29, 134.
31	*Unknown*, Pt., C. S. A.	Dec. 13, 1862.	Fragment of shell fractured trochanter major and neck of right femur.	Dec. 13, 1862.	Head, neck, and trochanters, by Surg. H. McGuire, P. A. C. S.	Died two or three days after operation, from shock. *Circ.* 2, pp. 23, 133.
32	*Unknown*, Pt., Ewell's Corps.	May 5, 1864.	Conoidal ball fractured neck of left femur, lodging.	May 5, 1864.	Head and shat'd fragments of neck and shaft, longitudinal incis'n, by Surg. H. McGuire, P. A. C. S.	Died May 22, 1864, pyæmia. *Circ.* 2, pp. 26, 133.
33	*Unknown*, Pt., Kershaw's S. C. Brigade.	May 3, 1863.	Musket ball shattered neck of femur.	May 4, 1863.	Head and neck, by Surgeon James, 16th South Carolina.	Died May 6, 1863. *Circ.* 2, pp. 24, 133, and EVE (*l. c.*, p. 257).

[1]CALHOUN (J. T.), *Army Correspondence*, in *Med. and Surg. Reporter*, 1862, Vol. VIII, p. 76.

[2]EVE (P. F.), *Contribution to the History of the Hip Joint Operations, etc.*, in *Trans. of Am. Med. Ass.*, 1867, Vol. XVIII, p. 261.

Of the thirty-three primary excisions at the hip seventeen were on the right side, thirteen on the left, and in three cases the side of the injury was not indicated. In twenty-two instances the straight, vertical longitudinal or linear incision, as variously termed by the different operators, was employed; in four instances the curvilinear; in one the V-shaped, and, in six cases the mode of incision was not indicated. In five instances the missile, either whole or in part, was excised with the injured bone.

Intermediary Excisions.—Of twenty-two excisions classified as intermediary, two resulted successfully, a mortality rate of 90.9. Sixteen of the operations were practised on Union and six on Confederate soldiers. The shortest interval between the dates of reception of injury and operation was two days, the longest twenty-eight, the average interval being about thirteen days. Details of the two successful intermediary excisions will be first noticed:

CASE 239.—Lieutenant *James M. Jarrett*, Co. C, 15th North Carolina, a spare man, 28 years of age, of medium size, of fair complexion, of temperate habits, and good general health, was wounded at the affair at Bristow Station, Virginia, October 14, 1863, by a conoidal musket ball, which entered in front and a little to the outside of the median line of the left thigh, two inches below Poupart's ligament, shattered the femur, and made its exit posteriorly at the outer part of the limb, the wound of exit being on a rather higher level than that of entrance. The fracture was dressed with a straight splint, and the wounded officer was placed in an ambulance wagon and transported over rough roads to Richmond, a distance of one hundred and sixty miles. On October 20th, he was admitted to hospital No. 4, at Richmond, in an exhausted state, and was placed in charge of Surgeon James B. Read, P. A. C. S. He complained of extreme pain upon any movement of the limb, and was unwilling to submit to an examination of the injury unless insensibility was induced. Chloroform having been administered, the splints and soiled bandages were removed, and the limb was placed in an easy position on pillows. Water dressings were applied to the wounds, and an opiate was administered. For the next three weeks, the progress of the case was very unfavorable. The wound of exit discharged copiously unwholesome thin pus, mixed with blood and bubbles of fetid gas and small bits of dead bone. The pulse was quick and small, the tongue red and dry. There was a tendency to diarrhœa, and night sweats frequently recurred. On November 9th, as the patient was steadily growing worse, a consultation was asked for, and Surgeons C. B. Gibson and M. Michel saw the case with Dr. Read. It was decided that the circumstances called for operative interference, and that an excision of the head of the femur offered the best prospect of recovery. On November 9th the patient was anæsthetized, and then placed on his right side on the operating table. A straight incision was commenced two inches below the posterior or exit wound, and was carried through this to the great trochanter, and thence upward for two inches further, thus making a wound about seven inches in length. This incision being carried down to the bone, the upper end of the shaft of the femur was examined and was found to be jagged and pointed, thin layers of bone about three inches long being broken off from its anterior aspect. The lower fragment was projected through the incision by adducting the limb and pushing the knee upward, and it was sawn about two inches below its upper sharp extremity. The trochanteric portion of the femur was then sought for, and was found drawn upward by the psoas and iliacus internus. Its extremity was seized by the lion forceps and drawn downward, and the attachments of these muscles to the lesser trochanter were divided. To luxate the head of the femur so as to admit of the division of the round ligament was a work of great difficulty. It was finally accomplished, partially by twisting the neck of the bone, and the head was exarticulated. The appearance of the principal portion of this excised bone is shown in the annexed wood-cut (FIG. 51). Several large detached fragments and splinters were then extracted, and other closely attached bits of bone were enucleated by the finger-nail. The wound was cleansed and then closed by sutures and adhesive strips. Dry dressings were applied, and the thigh was fixed by a large straight splint. The patient was ordered two grains of opium and a drachm and a quarter of brandy every two hours. At bed-time the patient was quite comfortable, and could shift his position slightly without pain; his pulse was 120. On the following day, anodynes were given at greater intervals. On November 11th, they were omitted, except at bed-time, and nutritious diet was ordered. The next day the sutures were removed; the wound began to discharge laudable pus in small quantity. The case progressed without any untoward complication. On December 9th the wound was healed, except at two points, connected by sinuses leading to the cotyloid cavity and the upper end of the shaft. The patient had gained flesh and strength; his pulse was full and strong at 76; his

FIG. 51. — Shattered upper portion of the left femur. [From a wood-cut after READ.]

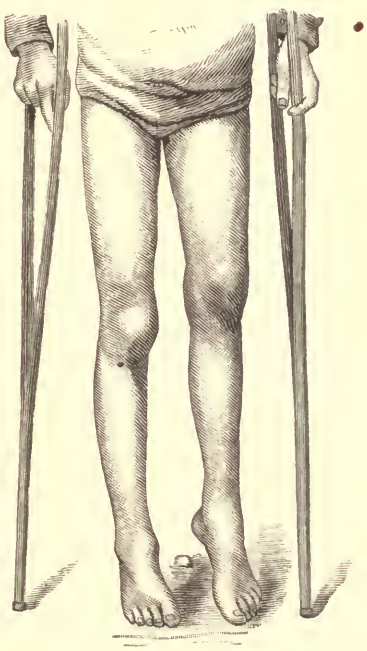

FIG. 52.—Appearance of limb seven months after operation. [From a photograph.]

appetite and digestion were natural; he slept well, was cheerful, and did not complain of pain. The limb was shortened five inches. The daily discharge of pus was less than half an ounce. Two weeks subsequently the wound was entirely united; the cicatrix was firm; the patient could move about his bed without inconvenience; there was no pain on pressure about the muscles of the injured part. The patient was now removed to his home in North Carolina, and was soon able to move about on crutches. In September, 1864, ten months after the operation, he reported that he was able to bear considerable weight on the limb, and that he had discarded his crutches and walked about in a high-heeled boot with the aid of a cane. The appearance of the patient, seven months after the operation, is exhibited in the wood-cut on the preceding page (FIG. 52), copied from a photograph presented to the compiler by Assistant Surgeon Latimer, C. S. A.

CASE 240.—Private Hugh Wright, Co. G, 87th New York, aged 28 years, a robust, healthy man, was wounded on May 5, 1864, at the battle of the Wilderness, by a conoidal musket ball, which entered the right thigh an inch within the track of the femoral vessels and two inches below Poupart's ligament, passed backward and outward, shattering the neck and trochanters of the femur, and, having been greatly flattened and distorted by the impact, it lodged amid the fragments of bone. The precise direction of the fracture is indicated in the accompanying wood-cut (FIG. 54).[1] He stated that after being wounded, he was carried to the rear by a number of his companions, and, in the evening, was taken to the field hospital of the 2d division of the Second Corps. Here he remained for three days. He was then sent in an ambulance wagon to Fredericksburg, and placed in a temporary hospital. He stated that his wound was repeatedly examined by different surgeons, but that no treatment was instituted beyond the application of a compress dipped in cold water to the wound. He was transferred, after a fortnight, on a hospital steamer, to Washington, and on May 25th he was admitted to Stanton Hospital, then under the charge of Surgeon B. B. Wilson, U. S. V. He was placed in Ward 6, under the care of Acting Assistant Surgeon J. B. Garland, who communicated a special report of the case. The injured limb was swollen, everted, and shortened. Pus had accumulated in the tissues about the hip. Notwithstanding the gravity of the injury, the patient's constitutional condition is said to have been hopeful. On exploring the wound with the finger, the patient being under the influence of chloroform, detached fragments of bone could be felt. On consultation with Acting Assistant Surgeon George A. Mursick,[2] an operation was decided upon, for the purpose of removing these loose fragments, and the missile, if it could be found. On May 27th, the patient was rendered insensible by sulphuric ether, and Dr. Mursick, assisted by Dr. Garland and others, made a straight incision, commencing above and behind the trochanter major and carried downward in the axis of the thigh. It was not in contemplation, at the beginning of the operation, Dr. Garland states, to exarticulate the head of the femur; but when the muscular attachments were divided, and the full extent of the fracture was revealed, and the joint was found distended with pus, it was at once determined to make a formal excision. The fragments of the neck were extracted piecemeal. The ball was found lying behind the neck, and was extracted. The capsular ligament being freely incised, a bistoury was inserted into the cotyloid cavity and the round ligament was severed, and the head of the femur was removed without difficulty. The jagged upper extremity of the shaft of the femur was then turned out of the wound by carrying the limb over the opposite knee, and was smoothed off by a chain saw. There was but trifling hæmorrhage, and no ligatures were required. The wound was carefully cleansed, dressed with dry lint, and left to heal by granulation. To keep the limb in position, long sand bags were laid on either side of it, and moderate extension was made by means of a weight attached to the leg and suspended from the foot of the bed. At night he took a grain of sulphate of morphia in a draught. The operation seemed to depress him very much, and reaction was slow. He passed a restless night, manifesting much nervous excitement. In the morning his pulse was feeble and frequent; his tongue dry and furred. He was ordered an ounce of brandy every three hours, a grain of opium every four hours, and as much beef tea and concentrated nourishment as he could take. On May 29th his general condition had much improved; the pulse was less frequent and stronger. There was free suppuration. The wound was dressed with a weak solution of permanganate of potassa. On June 1st he continued to improve, the wound looked well, and the character of the suppuration was good. The amount of brandy was reduced to four ounces daily. On August 1st he was still doing well. The wound was filled up with granulations from the bottom, with the exception of a sinus leading to the bone. It continued to suppurate quite freely, and some small pieces of dead bone had come away with the discharges. He had gained in flesh, and his health and spirits were good. On August 22d, he attempted, for the first time, to sit up in bed, but, owing to the rigidity of the parts and the agglutination of the muscles, the pain caused by the sitting posture was so severe that he was compelled to lie down again. Cold evaporating lotions were applied to the thigh. On August 23d the upper part of the thigh swelled and was painful, and the discharge was increased in quantity. On August 27th the swelling of the thigh had increased, the discharge from the wound was very free, thin, and flaky, and the surrounding surface was glazed and doughy to the touch. The wound of entrance had re-opened and discharged thin pus. An abscess formed on the inner side of the thigh, and about four ounces of thin flaky

pus was discharged. The patient was restless. He was ordered twenty drops of the tincture of the sesquichloride of iron every six hours, with stimulants and nutritious diet. On September 1st the swelling and inflammation of the thigh continued. He complained of nausea and want of appetite. An abscess formed on the outer side of the thigh. On September 5th the abscess was incised, and a large quantity of thin, flaky, and offensive pus was evacuated. He had an irritable stomach, and Hoffman's anodyne was administered. On September 6th the edges of the incision in the abscess were beginning to slough, and nitric acid was freely applied. On September 9th he had diarrhœa; ten grains of subnitrate of bismuth and a grain of opium were given every six hours. On September 13th the diarrhœa had nearly ceased. The patient's general condition had improved, and the wound looked well, though the suppuration was still copious, and had improved in quality. On September 25th a large ring-shaped exfoliation from the upper end of the femur was removed through the wound of operation. On September 26th another exfoliation was removed. On October 6th, 1864, Private Wright was discharged from the military service on account of the expiration of his enlistment. On October 7th the swelling of the thigh had subsided; the discharge from the wounds had much diminished in quantity, and presented the appearance of laudable pus; the diarrhœa had ceased, and his general condition was much improved, he being able to sit up in bed. On October 30th, a sinus communicating with necrosed bone opened on the outside of the thigh. In the latter part of December, another abscess formed on the outer side of the thigh. When this was opened the swelling and inflammation subsided. He continued to do well until February 6, 1865, when another abscess formed in the lower third of the thigh, on the outer side. This was incised and the pus evacuated. Several pieces of dead bone came away with the discharges from the wound of operation. About the middle of March, 1865, he was able to get out of bed, and to walk about the ward on crutches. Soon after, in getting out of bed, "he let his leg fall and hurt it." This accident was followed by inflammation and swelling of the thigh, and an abscess in the lower third of it, on the inner side. This was incised, and a small quantity of pus was evacuated. He was now attacked with erysipelas, which extended from the knee to the hip. This was combated with tonics and stimulants, such as iron and quinine, and rapidly disappeared. From this time he did well, taking daily exercise about the hospital on crutches. On April 17th, he was transferred to the Ward Hospital, at Newark, New Jersey. His general health was tolerably good. He could not bear much weight on his limb, and inflammation and abscesses followed any unusual exertion. He remained at this hospital until May 6, 1865, when it was reported that he "eloped." As a discharged soldier, he was no longer under military authority, and was at liberty to go. For many months, though diligent inquiries were made, he could not be traced; but, in July, 1866, Surgeon General L. W. Oakley, of New Jersey, transmitted a letter from Dr. W. Pierson, of Orange, New Jersey, which stated that Wright had entered the almshouse at that place in June, 1865, and had remained there until the following spring, under Dr. Pierson's professional care. At first, the mutilated limb had been enormously swollen from œdema, and there was an ichorous discharge from a sinus near the hip joint. With careful bandaging, the œdema gradually disappeared. In the spring of 1866, Wright left the almshouse, and engaged himself as a laborer on a farm. He wore, Dr. Pierson reported, a cork-soled shoe of his own manufacture. The limb was shortened precisely five inches. The circumference of the injured thigh at the highest part was one inch less than that of its fellow. He walked well without crutch or cane, bearing his full weight on the mutilated limb. There was quite free motion at the hip, but little at the knee. There were no open fistules, and no tenderness about any of the cicatrices. Dr. Stephen Wickes, of Orange, reported, in the summer of 1866, that Wright was in good health, though somewhat intemperate; that he worked daily at light tasks, and was even able to mow grass. He commonly walked with a cane. According to the measurement of Dr. Wickes, the limb was shortened four and three-quarter inches. About this period, Dr. Mursick, the operator in the case, discovered his former patient, and examined him. He found the resected end of the femur firmly attached to the pelvis by ligamentous tissue an inch and a half long. The agglutination of the muscular sheaths had nearly disappeared. The limb was quite under control. The man could flex and extend it slightly, and adduct to a limited extent; the power of rotating and abducting was lost. Motion at the knee was quite restricted, on account of the thickening and consolidation of the surrounding tissues resulting from inflammation. He stated that latterly the improvement in his limb had been very decided; that when he first commenced to walk, the limb felt like a weight attached to the body; this sensation had entirely disappeared. January 15, 1867, Hugh Wright was found duly established at his residence in North Orange, Essex, New Jersey, receiving a pension dating from October, 1864, the date of his injury. The Pension Examiner, Dr. A. W. Woodhull, of Newark, reported "that at that date there was about six inches shortening, with no power of flexion or extension at the hip and the power of rotation to a very limited degree. All motion of the injured limb for progression was imparted by lateral swing of the body itself. I may add that the knee joint of the injured limb is stiffened." On October 19, 1867, Dr. Mursick again examined Wright, and took him to New York, and had his photograph taken. The negative is preserved at the Army Medical Museum, and is No. 188 of the Surgical Series of Photographs, a reduced copy of the lower limbs as shown, in the photograph, is presented in the wood-cut (FIG. 53). At this period, Wright reported that his limb had given him no trouble since the sinuses healed, in May, 1865, and that it sufficed for all purposes of locomotion. He stood on it very firmly, and could move it in any direction with an easy, swinging motion. He had been engaged for a year and a half as a farm hand, and was employed at that time as a wood-chopper. He had for a short time earned larger wages as a hod bearer, and had climbed high ladders with a heavy hod of bricks on his shoulders; but he found this avocation too fatiguing. His general health and physical condition were good. The knee joint continued quite stiff. It could be flexed to about quarter, perhaps, of the normal extent. When he walked, the rounded upper extremity of the femur played up and down on the dorsum of the ilium over a space of an inch and a half. In November, 1868, Dr. Mursick again examined Wright, and reported on his condition. The utility of his limb had augmented during the twelve months that had elapsed since the last examination. The attachment of the femur to the pelvis was strong; the cicatrices were firm and healthy. All the movements of the thigh were performed with almost as much facility as in the normal state; rotation, even, as well as flexion, extension, adduction, and abduction. His general health was good. On August 3, 1872, Wright's pension was increased to $18 per month on account of increasing disability and because additional legislation permitted larger payment to the more gravely mutilated. In September, 1873, Pension Examiner A. W. Woodhull reported the local disability unchanged, and, on October 26, 1874, the sudden death of the pensioner, Hugh Wright, from supposed cardiac disease was reported. Unfortunately no autopsy was made and the valuable opportunity of examining the relations of the resected joint was unimproved.

In the twenty unsuccessful intermediary excisions the average duration of life after operation was twelve and a half days. One patient (CASE 248) survived seventy-five days, and apparently succumbed to climatic influences rather than to the effects of the injury and operation; another (CASE 251) died at the end of three weeks with colliquative diarrhœa and malarial complications. Four cases where the lesions seemed to indicate the operation, made little or no recuperative effort, and form the first category. The first was a solitary instance of fracture by a shell fragment:

CASE 241.—Private Cornelius Callaghan, Co. G, 2d Delaware, was wounded in the left hip by a fragment of shell, at the battle of Antietam, September 17, 1862. On September 19th, he was admitted to hospital No. 3, at Frederick, Maryland. He was placed under the influence of chloroform, and an examination of the wound was made by Assistant Surgeons Bill and Colton, U. S. A. The wound being enlarged sufficiently to admit of free exploration, the trochanteric region of the femur was found to be badly comminuted, the great trochanter entirely detached and drawn backward by the action of the gluteus, while fissures extended up the neck within the capsular ligament. No fissures extended below the trochanter minor. The patient's general condition was good, and all the circumstances being favorable to such an attempt, it was determined, in a consultation of the medical staff, and with the approval of Medical Inspector Coolidge and Surgeon Milhau, U. S. A., that the injured portions of bone should be excised. On September 29th, Assistant Surgeon J. H. Bill made an incision from the wound three inches downward in the course of the shaft, and another three inches long curving upward and inward from the wound to a point a little below the anterior superior spinous process of the ilium. The muscular attachments being dissected aside, a chain saw was passed around the shaft of the femur and made to divide it just below the trochanter minor. The head of the bone was then disarticulated. The edges of the wound were united by six sutures, and adhesive plasters and water dressings were applied. The limb was kept in position by pillows, without the use of splints. A full dose of morphia was given, and light but nourishing food was directed. On the following day the patient was quite comfortable. His pulse, which was 100 before the operation, now beat 120. He was ordered a diet of beef tea, eggs, and oysters, with a small amount of wine. At midnight he was sleeping quietly. On October 1st he was still cheerful. His pulse was very compressible at 120, and he was sweating profusely. The thigh was swollen and painful. A draught of aromatic sulphuric acid with a little quinia was added to his prescriptions, and the allowance of wine was increased. The prognosis was now very unfavorable. On October 2d the sweating was checked, but diarrhœa had supervened. The pulse was still softer and more frequent, and suppuration had commenced. At midnight the patient was attacked with vomiting and hiccough. On October 3d the vomiting persisted, and the sweating was renewed. This state continued through the day and night, the patient sinking gradually. He died at 3 o'clock P. M. of October 4, 1862. The pathological preparation is deposited in the Army Medical Museum, and is numbered 840 of the Surgical Section. An anterior view of it is presented at page 247 of the Catalogue of the Surgical Section, and a posterior view in the accompanying wood-cut (FIG. 55).

FIG. 55.—Neck and trochanters of right femur shattered by a fragment of shell, and excised. *Spec.* 840, Sec. I, A.M.M.

CASE 242.—Private D. M. Noe, Co. C, 46th Ohio, aged 22 years, was wounded at the battle of Shiloh, Tennessee, April 6, 1862, by a conoidal musket ball, which shattered the neck of the left femur. The patient was placed on board the hospital transport steamer Lancaster, under the charge of Surgeon George C. Blackman, U. S. V. On April 16, 1862, chloroform having been administered, Dr. Blackman made a longitudinal incision four inches in length over the trochanter, and excised the head, neck, and trochanters, together with three inches of the shaft of the femur, the diaphysis being divided by a common amputating saw. The patient reacted well after the operation, and for five days the symptoms progressed favorably. Pyæmia was subsequently developed, and death ensued on April 24, 1862, eight days after the operation.

CASE 243.—Private *Marsella Smith*, Co. F, 38th Virginia, a robust middle-aged man, was wounded near Spottsylvania, early in the morning of May 10, 1864, by a conoidal musket ball, which entered at the upper posterior part of the left thigh, passed through the perinæum without injuring the urethra, and through the soft parts of the right hip. He was sent to Richmond by rail, and was admitted to hospital No. 9, otherwise known as the Receiving and Wayside Hospital, on the following morning. On May 12th he was placed under chloroform and the wound was thoroughly explored. The limb was everted and shortened and swollen; there was crepitus on rotation. The fracture appeared to be limited to the great trochanter and neck. It was supposed that the urethra was divided; but this was afterwards proved not to be the case. Surgeon Charles Bell Gibson, C. S. A., decided to excise the injured bone, and the operation was performed forty-eight hours after the reception of the injury, the head, neck, and two inches of the shaft being removed. It is stated that the effects of the chloroform were unfavorable. On the following day "patient commenced sinking at an early hour, and continued growing more and more feeble until 3 o'clock P M., when death ended his sufferings," May 13, 1864. The excised portion of the femur was preserved by Dr. Richardson, and has been presented by him to the Army Medical Museum. It is represented in the accompanying drawing (FIG. 56), and shows that the injury to the bone was altogether external to the hip joint.

FIG. 56.—Oblique gunshot fracture of the upper portion of shaft of left femur. *Spec.* 5500, Sect. I, A.M.M.

CASE 244.—A soldier of General Buell's army was wounded in a picket skirmish, about seven miles from Nashville, in March, 1862, by a conoidal musket ball, which shattered the neck and trochanters of the femur. He was immediately conveyed to Nashville, and placed in the College Hospital, under the care of Surgeon A. H. Thurston, U. S. V. Surgeon M. Goldsmith, U. S. V., saw him in two days after the reception of the injury, and deemed the case peculiarly well adapted for the operation of excision. The surgeon in charge concurring in this opinion, the patient was anæsthetized, and Dr. Thurston proceeded to excise the head and splintered upper extremity of the femur, through a long straight incision. The operation was accom-

plished with but little hæmorrhage, and although the patient was much prostrated by the shock of the injury and of the operation, he reacted and was in a comfortable condition for several days. But surgical fever and suppuration soon set in, and he gradually sank, and died one week after the operation. There can be little doubt that the subject of this operation was Corporal Henry F. Smith, Co. B, 1st Wisconsin, who, according to the records of the Nashville Hospital, was admitted for a gunshot wound of the hip, and was the only patient who died from wounds in Dr. Thurston's wards, at the period referred to.[1] Corporal Smith died on March 15, 1862. The operation was probably done on March 10th.[2]

In the second category of intermediary excisions are grouped eight cases well adapted from the local lesions for the operation in which all the patients made a struggle for recovery, and two survived respectively five and eleven weeks:

CASE 245.—Private *T. C. Christopher,* Co. D, 18th South Carolina, aged 21 years, a robust man, was wounded at Williamsburg, Virginia, May 5, 1862, by a conoidal musket ball, which entered about two inches below and behind the left trochanter major, and passed forward, upward, and inward. He was stooping at the time he received the injury. He was made prisoner, and sent to York River, and thence on a hospital steamer to Washington, and placed in Cliffburne Hospital, May 17th. His pulse was 100, and he complained of severe pain in the hip and knee. The tissues about the hip were much swollen; the limb was everted, and shortened one and a half inches. The opening made by the bullet was very small, and discharged a thin sanious pus. There was no orifice of exit. The patient was etherized, and careful exploration of the wound revealed a fracture of the inner portion of the neck and probably of the head of the femur. It was decided that excision should be performed, and the patient was placed upon a soothing and supporting regimen preparatory to the operation. May 20th, Assistant Surgeon J. S. Billings, U. S. A., made a curvilinear incision, four inches in length, one inch behind the great trochanter, that revealed the condition of the parts. Fragments of the inner extremity of the neck were removed piecemeal. The head was then removed from the cotyloid cavity, except a small fragment which was extracted from an intermuscular space. The ball was now discovered lying in the obturator externus muscle, and extracted. Little blood was lost, and reaction took place. Water dressing was applied, and a grain of sulphate of morphia administered. Eversion of the foot was corrected by fastening the limb by straps of adhesive plaster to an upright piece of wood screwed to the foot of the bedstead, and, the latter being raised, adequate extension and counter-extension were secured. On May 21st, the patient reported a comfortable night, but now had a very irritable stomach, with frequent vomiting. His skin was cool and clammy; his pulse small and feeble at 115. He was ordered aromatic spirits of ammonia in small doses, brandy, egg-nog, and beef essence, with sinapisms to the epigastrium. On May 23d, the irritability of the stomach had subsided. The patient was weaker; stimulants and concentrated nourishment were given. On May 24th, the patient rapidly grew weaker. Capillary hæmorrhage took place from the surfaces of the incision, but was readily checked by the application of a solution of persulphate of iron. Enemata of beef essence and brandy were administered, and these articles also by the mouth. The patient sank rapidly, and died May 24th, five days after the operation. At the autopsy, twelve hours after death, the soft parts about the seat of injury were found dark in color and softened. The acetabulum was eroded. A clot of blood of three ounces was found between the peritoneum and iliacus externus muscle. The innominatum and superior portion of the femur were removed, and, together with the excised fragments, forwarded to the Army Medical Museum, and numbered 19 of the Surgical Section, having been mounted among its earliest specimens, and it is represented in the wood-cut (FIG. 57).—(*Circ.* 6, S. G. O., 1865, p. 62, and *Circ.* 2, S. G. O., 1869, pp. 35, 135.)

FIG. 57.—Transverse shot fracture of the anatomical neck of the left femur, with caries. *Spec.* 19.

CASE 246.—Private *T. E. Foulke,* Co. D, 2d Alabama, aged 17 years, was wounded and captured at Fort Blakely, Alabama, April 9, 1865. A conoidal musket ball entered posteriorly at the middle third of the left thigh, fractured the upper third of the femur, including the trochanters and neck, and was removed from above the anterior superior spinous process of the left ilium. The patient was then transferred to New Orleans, and, on April 15th, he was admitted to the St. Louis Hospital. On admission he was very much exhausted by profuse suppuration, the soft parts about the hip-joint being filled with unhealthy pus. On April 27th Surgeon A. McMahon, U. S. V., excised the head, neck, trochanters, and two inches of the shaft of the left femur, the patient being under the influence of chloroform. He was placed on nourishing diet, with two bottles of porter daily, eggs, beef tea, and everything he desired. On May 26th he was transferred to the Marine Hospital at New Orleans. He was then doing well; but he gradually failed, and died June 5, 1865, of exhaustion, thirty-nine days after the operation.

CASE 247.—Private Charles E. Marston, Co. F, 1st Massachusetts, aged 19 years, a pale and delicate boy, was wounded at the second battle of Bull Run, August 30, 1862. He was admitted to the College Hospital, Georgetown, D. C., on September 6th, having laid on the battle-field several days, and then moved in an ambulance wagon thirty miles over very rough roads. An examination revealed a large bullet wound an inch anterior to and on a line with the right trochanter major, with great comminution of the head and neck of the femur. The limb was shortened, and the foot was everted. The circumference of the

[1] The above account has been submitted to Dr. M. GOLDSMITH, who states that he thinks that the identification of the case is complete. Surgeon THURSTON died during the war.

[2] The report of the Adjutant General of Wisconsin for 1865, p. 33, states that on March 8, 1862, five companies of the 1st Wisconsin Volunteers were sent out beyond Nashville on picket duty. They were attacked by a cavalry force, and Private Willett Greenly was killed—"the first Union soldier killed in Tennessee"—while Corporal H. F. Smith and one other were wounded, and were sent to Nashville.

limb exceeded that of its fellow by half. The pulse was 112, and of moderate volume. The tongue was rather dry. The patient suffered little pain. The general condition was not promising, and yet not very bad. Excision of the fractured bone was decided upon, and, on the 27th of September, Assistant Surgeon B. A. Clements, U. S. A., assisted by Assistant Surgeon Charles H. Alden, U. S. A., and the surgical staff of the hospital, proceeded to perform the operation. Chloroform was administered, and a slightly curved incision five inches in length was made on the outside of the thigh, the shot hole in the middle of the incision, and the trochanters and neck were thus exposed. The neck was crushed into about forty fragments, which were extracted. The head was also much broken, and the round ligament was absorbed or destroyed, so that exarticulation was easy. The roughened portion of the neck, at its attachment with the trochanter, was sawn off with a small chain saw.

FIG. 58.—Shot comminution of head and neck of right femur. *Spec.* 328.

The missile, a conoidal musket ball, was found on the inner side of the thigh at the bottom of a large cavity, and was removed with difficulty. After thoroughly syringing the wound and removing the powdered bone, the wound was closed by silver sutures, except at the bullet hole, and sand bags were placed to keep the limb in position. Slight extension was made by a weight to the foot. The patient expressed himself as relieved by the operation, and he slept well that night. On the following day his pulse had risen to 128, and the discharge from the wound was very copious, thin, and brown. On September 29th, his pulse was still quick and feeble, and his tongue dry, and, though he took nourishment well, and was free from distress, he gradually sank. He died on September 30, 1862, at half past 8 o'clock A. M., three days after the operation. At the autopsy, on October 1st, made by Acting Assistant Surgeon G. K. Smith, the wound made by the operation was found to be filled with very offensive pus. The upper end of the shaft of the femur was found to be diseased on its posterior surface near the trochanter minor, and the periosteum was loosened from the bone for some distance above and below this point. The fracture of the ischium, which was noticed at the operation, extended obliquely upward and backward from the lower border of the acetabulum, terminating in the sciatic notch, about an inch and a quarter above the spine of the ischium. The lower half of the acetabulum had been broken into several fragments, which were held in position by the cotyloid ligament. The excised portions of the femur were forwarded to the Army Medical Museum, and are numbered 328 in the Surgical Section. They are represented in the adjoining wood-cut (FIG. 58).

CASE 248.—Private John Miller, Co. E, 162d New York, aged about 38 years, a robust, phlegmatic German, in good health, was wounded on June 14, 1863, in the assault on Port Hudson, Louisiana, by a conoidal musket ball, which passed through the upper portion of the thigh, breaking the neck of the left femur transversely, and splitting it longitudinally, but without great comminution. The pelvis was uninjured, and there was no serious damage to the soft tissues. The patient was conveyed to New Orleans on a hospital transport, and was placed in the St. Louis Hospital, on June 16th. It was determined that excision of the injured bone was advisable, and the officer in charge of the hospital, Surgeon F. Bacon, U. S. V., being confined to his bed by illness, the operation was performed on July 8th, by Assistant Surgeon George W. Avery, 9th Connecticut. The head, neck, and great trochanter were removed in the usual way, through a single straight incision of moderate extent over the trochanter and in a line with the axis of the femur. There was an immaterial loss of blood. The state of the tissues involved and the constitutional condition of the patient were as good as might be. Dr. Bacon remarked that the operation was well and rapidly performed. The patient rallied from it promptly, and afterwards received the most assiduous care. His progress was very favorable until the early part of September. The wound had nearly healed, and Surgeon Bacon and his assistants were very hopeful of the patient's recovery. But in September the weather became most oppressively hot, and the patient steadily declined. The wound assumed a bad appearance, discharging copiously, and despite sustaining measures, the patient sank and died from exhaustion on September 21, 1863, seventy-five days after the operation. Dr. Bacon examined the fragments of bone removed, and found the periosteum adherent throughout the larger pieces.

CASE 249.—Private Henry Phillips, Co. I, 146th New York, a robust man, aged 34 years, was wounded at the South Side Railroad, near Petersburg, on April 1, 1865, by a conoidal musket ball, which entered the left thigh and lodged against the anterior surface of the neck of the femur. The patient was conveyed to the field hospital of the 2d division of the Fifth Corps, and thence by ambulance and rail to City Point, where he arrived on April 4th, and was transferred by steamer to Washington, and, on April 6th, was admitted into Douglas Hospital. He was much exhausted and had considerable fever, though in frequency the pulse and respiration were nearly normal. The wound was painful, and the beginning of its grave constitutional aspect was becoming manifest. There was no shortening or deformity of the limb. At a preliminary exploration the ball was found impacted near the anatomical neck, and was extracted. The limited nature of the fracture was also ascertained, and excision was decided on. On April 8th the patient was placed under the influence of ether, and Assistant Surgeon William F. Norris, U. S. A., excised the head, neck, and trochanter major through a curved incision six or seven inches in length with its convexity forward. About twelve or sixteen ounces of blood were lost during the operation. One small artery required a ligature. The ball had crushed in the laminated structure of the anterior face of the neck, and from this cup-shaped cavity a small fissure ran up the articular surface and a deep fissure nearly around the neck; but the separation between the head and neck was incomplete. During the operation this fracture was converted into a complete one in rotating the bone to facilitate the exarticulation. The operation concluded, the limb was supported by pillows, and the patient was ordered beef tea and milk punch every three hours, and a full dose of opium at midnight. He had another dose of laudanum at four o'clock the next morning. On the 9th, 10th, and 11th, there was little pain, and anodynes were not required, but concentrated nourishment and stimulants were assiduously administered. It was thought the nurse exceeded his instructions in the amount of whiskey given, for on April 12th, the patient had hiccough and nausea, and his breath was redolent of alcoholic fumes. He was now transferred to the immediate charge of Acting Assistant Surgeon C. Carvallo. A laxative enema was administered, and, when the bowels were unloaded, a sinapism at the epigastrium, and small doses of creasote allayed the irritability of stomach. On April 13th the stomach was quiet, pulse 120, rather weak,

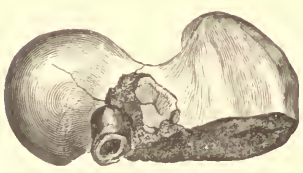

FIG. 59.—Fracture of head and neck of left femur by a conoidal musket ball. *Spec.* 3235, Sect. I, A. M. M. ½

and there was profuse perspiration. The patient was ordered a cupful of beef tea every two hours, one of milk punch every four hours, milk toast and soft boiled eggs at breakfast and dinner. No change the next day. On the 14th the wound looked well. Some shreds of disorganized connective tissue were removed by the dressing forceps. There was some pain and difficulty in micturition. Small doses of tincture of the sesquichloride of iron were directed thrice daily, and chicken broth was added to his dietary. No entry of importance appears on the 16th. On the 17th the pulse was 120, respiration 32. Slight pain on right side, and signs of pleurisy on auscultation. There was an erythematous blush about the wound, and, in the evening, there was diarrhœa, which was checked by pills of opium and nitrate of silver. On the 18th the pleurisy was worse, the breathing more rapid, and there was retention of urine, so that it was necessary after this to use a catheter. April 19th the countenance was sunken, and the wound was flabby. There was a sore on the sacrum. The patient was moved to a Crosby Invalid Bed. He had a draught containing ammonia and sugar, and a blister on his side. April 20th the nurse reported a chill during the night. The breathing was labored. There were sordes on the teeth. At the next morning visit the patient was very low. He died before noon, April 21, 1865, eleven days after the operation. The autopsy revealed dry pleurisy on either side; lungs healthy, somewhat congested posteriorly; heart and liver not abnormal. A large sub-peritoneal abscess in the course of psoas and internal iliac muscles, which appeared to originate in the obturator foreamen and ascend along the left iliac fossa, denuding the bone of its periosteum. No evidences of pyæmia were found, though it was strongly suspected after the occurrence of the chill on April 20th. The pathological specimen, contributed by the operator to the Army Medical Museum, is represented at page 246 of the Catalogue of the Surgical Section of 1866, and by the wood-cut (FIG. 59).

CASE 250.—Captain John Phelan, Co. A, 73d New York, aged 22 years, received a compound comminuted fracture of the neck and upper extremity of the left femur at the battle of Spottsylvania Court House, on May 14, 1864. On May 16th, he was admitted to Mount Pleasant Hospital, Washington. The rapid and incessant influx of wounded was such that the attention of the overworked hospital staff was not especially drawn to his case for some time after his admission, and the delay in minutely examining the case was extended by the uncomplaining fortitude of the sufferer, who expressed his wish that the more serious cases should first be attended to, and declared that his own sufferings were comparatively slight. When, however, Acting Assistant Surgeon Mulford, the ward surgeon, proceeded, on June 3d, to adapt apparatus to what he supposed to be an ordinary gunshot fracture of the upper third of the thigh, he was led to apprehend that the injury extended to the coxo-femoral articulation, and requested the opinion of the surgeon in charge of the hospital, Assistant Surgeon C. A. McCall, U. S. A., as to the diagnosis and treatment. Dr. McCall immediately visited the patient, and found him to be a large, muscular, finely formed man, whose previous health had been excellent. When lying quietly in bed, he suffered but little. His appetite was good; and his strength, so far, had diminished but little. Altogether, his general condition was extraordinarily good, in view of the gravity of the injury he had sustained. The ball had entered in front, just over the point at which the profunda is given off from the left femoral artery. The aperture of entrance was small and characteristic as an entrance wound of a conoidal musket ball. The missile had passed toward the great trochanter and shattered it. Further, its course could not be ascertained at the time. Any movement of the limb caused extreme pain. Though the femur was much comminuted, Dr. McCall was not positive that the hip joint was implicated, and, with a view to a full exploration of the injury, he directed Dr. Mulford to make a longitudinal incision three inches in length over the trochanter, to explore the parts thoroughly, and to ascertain by digital examination the condition of the articulation. If it was uninjured, Dr. Mulford was instructed to extract detached fragments of bone and foreign matters, to close the upper part of the wound, and to avail of the lower portion for drainage. In the afternoon the patient was etherized, and the exploratory incision was made, and it was found that the fracture extended to the head of the femur. It was then decided to excise the head. The patient was again rendered insensible by the inhalation of sulphuric ether, and Dr. McCall extended Dr. Mulford's incision upward an inch or more, and then made an oblique incision across its upper extremity, as represented in the accompanying figure (FIG. 61). The two flaps thus marked out were reflected, and the joint was readily exposed, the round ligament divided, and the head of the femur exarticulated. The acetabulum was carefully examined and found to be uninjured. Seven large and numerous small fragments of the neck and trochanter major were then removed, a task requiring much time and patience, many fragments being driven into the gluteal muscles, or deeply retracted by the muscles attached to the great trochanter. The fractured upper extremity of the femur was then brought out at the wound, by adducting and pushing upward the knee of the injured limb, and all diseased tissue was removed. The periosteum was in a healthy condition quite up to the end of the bone. The wound was now thoroughly washed out, and approximated by three stitches, and by adhesive strips. A grain of sulphate of morphia was administered, and the patient was put to bed. The operation lasted three-quarters of an hour. Dr. McCall thinks that the ball was removed during the operation; but is not positive on this point. The hospital report, which is quoted at page 69 of *Circular* No. 6, S. G. O., 1865, states that the patient's pulse was quick and irritable at the time of the operation, that he had a furred tongue and diarrhœa, and was reduced by suppuration. But Dr. McCall (letter of February 11, 1868) thinks that this report exaggerates the gravity of the constitutional symptoms, and is quite sure that the general condition was favorable. The patient rallied well from the operation. For two days the wound was dressed with lint. Suppuration then commencing, the limb was placed in Fergusson's apparatus for excision of the head of the femur, the counter-extension straps being left off. The wound was freely syringed with cold water containing a little permanganate of potassa. A nourishing diet was ordered, with tonics

FIG. 60.—Excised head and fragments of neck of left femur. *Spec.* 2618.

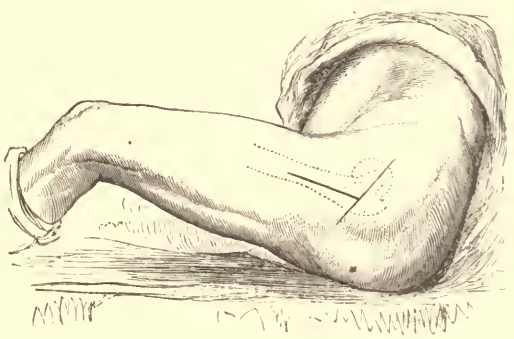

FIG. 61.—Direction of the incisions in case of excision of the head of the femur. [From a drawing by Dr. MCCALL.]

and stimulants. For a week or ten days subsequently, the case progressed favorably. Suppuration was moderate in amount, and of a healthy character. About the middle of June, the weather became intensely hot. The atmosphere of the wards, in which nearly every bed was occupied by a patient with suppurating wounds, became intensely oppressive. About this time, the patient began to grow worse. The cheerful resolution and hopefulness he had hitherto evinced, gave way. Diarrhœa supervened, and he lost strength rapidly. The fatal event was thought to have been delayed by the plan which was pursued of daily removing the patient in his bed at nine in the morning to a spot beneath the shade trees near the hospital, where he had pure air and escaped the distressing scenes of the ward; he remained each day until five in the afternoon. He died on June 21, 1864. The portion of bone excised was forwarded at the time of the operation to the Army Medical Museum. The preparation is No. 2618 of the Surgical Series. It is represented in the adjacent wood-cut (FIG. 60).

CASE 251.—A private soldier of General Pope's Army of Virginia, was admitted on September 2, 1862, to the Cliffburne Hospital at Washington, D. C., with a gunshot fracture of the neck of the left femur, received at the second Bull Run battle, on August 29, 1862. A conoidal musket ball had entered the left hip directly over the trochanter major and embedded itself in the neck of the femur. The trochanter major and the neck of the femur were split and comminuted, but the head was uninjured. The patient had suffered greatly from the journey from the battle-field to the hospital, and was prostrated by diarrhœa and malarial complications. The tissues about the hip joint were but slightly swollen, and the wound discharged healthy pus. It was decided that excision was the most hopeful resource, and on September 4, 1862, Assistant Surgeon John S. Billings, U. S. A., proceeded to operate. Chloroform was administered, and a straight incision was made over the trochanter major, and the head and fragments of the neck were removed. The shaft of the femur was then divided by a chain saw at the level of the trochanter minor. The patient reacted well from the operation. He was placed on a fracture bed, and extension by means of a weight was made on the injured limb. The diarrhœa increased in severity despite all treatment, and the patient succumbed, exhausted, on September 24, 1862, twenty days after the operation.

CASE 252.—"Private Michael Welsh, Co. H, 10th Kentucky, aged 40 years, was struck by a conoidal ball in the region of the left great trochanter, at the battle of Chickamauga, September 20, 1863, and at once conveyed to a field hospital, which soon after fell into the hands of the enemy. Ten days subsequently, he was brought to Chattanooga; and during the period of his captivity the only nourishment that he received was a small portion of corn-meal gruel daily. Having lost his blankets, he also suffered much from cold, and had contracted a rather severe bronchial inflammation. On the 1st of October, he was admitted into the general field hospital of the Fourteenth Corps, when a conoidal musket ball was removed from among a mass of small fragments of the neck of the femur, the ball having entered just anteriorly to the great trochanter. Two days subsequently, Surgeon F. H. Gross, U. S. V., carried a curvilinear incision, with its convexity presenting forward, and including the opening made by the ball, from above downward, and excised the head of the femur along with the attached greater portion of the lower surface of the neck of the bone. Many fragments were removed with the forceps; but as the trochanters were not involved in the injury, the remaining sharp portions of the neck were trimmed off close to the inter-trochanteric lines, which completed the procedure. No ligatures were required. The man bore the operation well, and the limb was placed in a comfortable position. From the date of the operation up to October 20th, the man did very well, in spite of his enfeebled condition and bronchial trouble, when the discharge from the wound became sanious. On the same night he had a chill and was delirious, and the pulse was very feeble and frequent. On the 25th of October his condition is thus described: Pulse 125 and very feeble; tongue dry and red; had a natural alvine evacuation. At 9 o'clock A. M. hæmorrhage recurred from the wound, which was arrested by injecting a solution of sulphate of iron. Stimulants freely administered, but the man grew more and more feeble, and expired at 2 o'clock P. M. No *post-mortem* examination was held, but death was evidently due to pyæmia. The specimen shows that about one-fifth of the head at its upper aspect has been shot away, together with the entire upper surface of the neck, about one-half of the anterior and posterior surfaces and the lower border of the neck remaining." The pathological specimen, illustrated by the accompanying wood-cut (FIG. 62), was forwarded to the Army Medical Museum, June 3, 1868, by the operator.

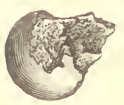

FIG. 62.—Shot fracture of neck of left femur. *Spec.* 5442.

The third category of intermediary excisions includes eight cases in which the conditions revealed on exploration offered little prospect of success. All of the patients were subjected to rough transportation. The first case was complicated with shot perforation of the elbow, the second was a man of sixty in poor health, the third a lad, rudely exposed in a wagon without springs; two others had wounds penetrating the pelvic cavity, and, in one of these cases, a splinter of the left innominate bone opened the internal iliac vein, and led to uncontrollable hæmorrhage, while, in the other, hyperacute peritonitis supervened.

CASE 253.—Private *G. W. Brantley*, Co. C, 2d Alabama, aged 18 years, was wounded and taken prisoner at Fort Blakely, Alabama, April 9, 1865. A conoidal musket ball had passed through the left groin, fractured the neck of the femur, and emerged posteriorly at the apex of the left buttock. He also received a gunshot fracture of the external condyle of the right humerus. He was conveyed to New Orleans, and, on April 15th, he was admitted to the St. Louis Hospital. The thigh, groin, and surrounding parts were infiltrated with unhealthy pus, and the patient was very much exhausted. On April 28th, the patient was anæsthetized by chloroform, and Surgeon A. McMahon, U. S. V., proceeded to excise the head, neck, and trochanters of the left femur. No arteries required ligation. The patient did not rally very well. Stimulants were freely administered; but the patient sank, and died on May 2, 1865, of capillary hæmorrhage. The condition of the patient did not admit of any operation on the elbow joint.

CASE 254.—Private Peter Boyle, Co. D, 59th Massachusetts, aged 60 years, was wounded at Petersburg, July 30, 1864. A conoidal musket ball entered the left hip and passed antero-posteriorly through the soft parts and surgical neck of the femur,

and fractured the trochanter major. His entry at the base hospital at City Point and transfer to Washington are recorded on August 1st. He was conveyed to Washington on an hospital steamer, and on August 3d was admitted to Douglas Hospital. His constitutional condition, on admission, was poor The wound, however, had an healthy aspect, and a thorough exploration showed that the injury to the soft tissues involved no important part, and that the fracture at the junction of the neck and trochanter major was not accompanied by much longitudinal splintering in either direction. Assistant Surgeon William Thomson, U. S. A., decided that an excision of the injured bone was expedient, and that the operation should be done as soon as the patient had rallied from the fatigue and irritability induced by his long journey. On August 5th, ether having been administered, Assistant Surgeon Thomson proceeded to excise the head, neck, and trochanters of the left femur, through a straight incision of sufficient length made over the trochanter major. The rotator muscles and the tendons of the psoas and iliacus being divided, the round ligament was readily cut and the head exarticulated. The section of the shaft was made by a chain saw at the level of the trochanter minor. The operation was rapidly accomplished, and there was no hæmorrhage of moment. The wound was dressed with an antiseptic solution of one drop of creasote to each ounce of water on charpie, and the limb was supported by a sand bag on either side. The patient reacted well after the operation; but at night there was profuse sweating and some nausea. On the following morning he ate a good breakfast. He still had a cool, sweating skin, and his pulse was at 128. He gradually sank, and died from exhaustion on August 7, 1864. The pathological preparation, presented by Dr. Thomson to the Army Medical Museum, is figured by the accompanying wood-cut (FIG. 63).

FIG. 63.—Shot perforation of neck of left femur. *Spec.* 3593.

CASE 255.—Private Charles C. Cleaver, Co. C, 2d Infantry, aged 18 years, was wounded at the battle of Spottsylvania, on May 12, 1864, by a conoidal musket ball, which fractured the neck and trochanters of the right femur. He was transferred to Fredericksburg and thence to Belle Plain in a wagon, and thence on a steam hospital transport to Washington. On May 18th he arrived at Washington, and was admitted to Judiciary Square Hospital. The soft parts of the upper and outer part of the thigh were extensively lacerated, and pus of an ill-conditioned character was burrowing in every direction around the wound. The patient's condition was unfavorable; but it was decided that excision of the fractured portion of the femur afforded the only prospect of relief. Accordingly, on the 19th, Assistant Surgeon Alexander Ingram, U. S. A., proceeded to make a curved incision six inches in length, through which the head, neck, and four and a quarter inches of the shaft of the femur were removed. Carpie soaked with permanganate of potash was applied to the wound, and tonics and stimulants were freely given. Pyæmia supervened, and the patient died on May 23, 1864, four days after the operation. The pathological specimen, figured in the accompanying wood-cut (FIG. 64), is in the Surgical Section of the Army Medical Museum.

FIG. 64.—Shot fracture of the neck and trochanter of right femur. *Spec.* 2819.

CASE 256.—Private Alexander Ewing, Co. A, 140th Pennsylvania, aged 30 years, was wounded at the battle of Spottsylvania, on May 12, 1864, by a conoidal musket ball, which comminuted the upper part of the left femur. He was taken to the hospital of the 1st division of the Second Corps, and on the following day was sent to the rear in a wagon. Arriving at Belle Plain after a three-days' journey over rough roads, he was conveyed on an hospital steamer to Washington, and, on May 18th, he was admitted to Judiciary Square Hospital. There was considerable inflammation and swelling of the soft parts, and the patient was in poor health. On the following day he was anæsthetized, and Acting Assistant Surgeon J. F. Thompson made an incision five inches in length over the great trochanter, including in it the wound of entrance. The muscular attachments being divided, it was found that the neck was splintered, that fissures extended within the capsule, that the great trochanter was separated from the shaft, and the upper part of the shaft much comminuted. The head and fragments of the neck and trochanters were removed, and the shaft was sawn just below the trochanter minor. Ice was applied to the wound, and stimulants were freely administered. The wound assumed an unhealthy action, and the patient gradually sank and died from exhaustion on May 24, 1864, five days after the operation. The pathological specimen was not received at the Army Medical Museum.

CASE 257.—Corporal Henry C. Sennett, Co. F, 122d New York, aged 27 years, was wounded in front of Petersburg, March 27, 1865, by a conoidal musket ball, which entered midway between the anterior superior spinous process of the ilium and the trochanter major, and lodged in the head of the left femur. The patient was removed to Washington, and, on April 2d, was admitted to Mount Pleasant Hospital. He was feverish and fretful, and his tongue was furred; but the wound had a healthy aspect, and there was but little swelling or deformity of the limb. But exploration with the finger proved that the ball had penetrated the hip joint. On April 4th the patient being anæsthetized by an equal mixture of chloroform and ether, Assistant Surgeon H. Allen, U. S. A., made a T-shaped incision, four inches by six inches, over the trochanter major, and excised the head and neck of the femur. The head was fractured into three pieces, and the ball was embedded in it. Violent hiccough came on immediately after the operation and continued through the night, but was finally arrested by the persistent use of antispasmodics. On April 5th and 6th there was great tympanitis, the bowels being obstinately constipated. An enema of castor oil was administered without effect, and in two hours another of molasses and water and salt, which induced a slight evacuation. Singultus again recurred. On April 7th the bowels moved freely. A chill occurred, lasting half an hour. There was great abdominal tenderness on pressure, and other well marked symptoms of peritonitis. On the 8th the hiccough continued; the abdomen became greatly distended; the countenance became pinched and ghastly, and the patient died at ten at night. At the autopsy, made twelve hours after death, the lungs were found healthy; the liver greatly hypertrophied; the lower fifth of the ilium inflamed and injected. The tissues surrounding the hip joint were in a sloughing condition, and were infiltrated with fetid pus, which had burrowed several inches under the gluteal muscles and two inches below the trochanter minor. The acetabulum was denuded and slightly

FIG. 65.—Upper extremity of the left femur, from which the head, with a conoidal ball in it, has been excised.—*Spec.* 153.

fractured at its upper and posterior border. Two inches of the upper extremity of the shaft of the femur was denuded of periosteum. The specimen was presented by Dr. Allen to the Army Medical Museum, and is represented in the adjoining wood-cut (FIG. 65). The innominate bone was not removed; but the upper fourth of the femur was sawn off after death, and mounted with the excised head to show how completely the injury to the femur was limited to the epiphysis. Had it not been for the fracture of the pelvis, it would have been difficult to have found a case better adapted for the operation of primary excision.

CASE 258.—Private F. Machlin,[1] 11th Pennsylvania, a robust man, was wounded at the second battle of Bull Run, August 30, 1862. He laid on the field several days, and was then transported thirty miles in a wagon to the Warehouse Hospital, Georgetown, D. C., where he was received on September 8th. A musket ball had entered the right buttock and emerged an inch and a half below and within the anterior superior spinous process of the ilium. The limb was shortened, and the foot was everted; any movement gave excessive pain. A thorough examination was made under the influence of chloroform, and showed that the neck of the bone was comminuted and the shaft uninjured. The case was considered to be a particularly favorable one for the operation of excision of the broken fragments, and the general condition of the patient was such as to offer some hopes of its success, and it was determined to do the operation on the following day. But the surgeon in charge of the hospital was confined to his bed by illness, and was unable to see the patient for five days. On September 13th the general condition of the latter was less favorable. His pulse was 130, quick and weak, and his tongue was dry. He was placed under very careful nursing, and beef essence, brandy, eggs, and milk, and other concentrated nourishment and stimulants were administered *ad libitum*. By September 20th this treatment had produced slight improvement, and though he was still in a very unfavorable condition for an operation, it was determined, on consultation, that an excision might afford the patient relief from the constant pain he suffered, and that it could not greatly depress him. At noon on September 20th, accordingly Assistant Surgeon B. A. Clements, U. S. A., assisted by Dr. George K. Smith, of Brooklyn, and the surgical staff of the hospital, performed the operation. An incision five inches in length was made from a point two inches behind and an inch below the anterior superior process of the ilium, downward over the prominence of the trochanter major. The incision exposed the parts freely, and the muscular insertions being divided, and several small loose fragments of bone removed, the irregular broken extremity of the shaft, at its junction with the neck and the tip of the great trochanter, were excised by a chain saw. The remnant of the capsular ligament and the round ligament were now cut, the joint being opened from below and in front with a probe-pointed bistoury. A blade of a long bullet forceps was then introduced as a lever and the head was disarticulated by gently prying it out of the cotyloid cavity. These steps in the operation were facilitated by rotating the trochanter outward, and by lifting the extensor muscles by a metallic retractor. A small vessel was tied at the upper end and another at the lower end of the wound. The wound was well washed out by means of a syringe and a few stitches were applied, the middle portion of the wound being left open. The limb was suspended in a Smith's anterior wire splint. The patient appeared to rally from the operation satisfactorily. At 9 o'clock P. M. he was free from pain; his pulse was 136, and the skin was cool and natural. He had slept tranquilly. On the following day, September 21st, his pulse was 120 and very feeble. The discharge from the wound was dark and thin, and copious. His countenance was placid, the pinched, distressed expression it had worn having disappeared. But in the afternoon he sank rapidly, and died in the evening, thirty-six hours after the operation, September 21, 1862. The specimen is No. 329 of the Surgical Section of the Army Medical Museum, and is represented in the accompanying wood-cut (FIG. 66).—(*Circular* 6, S. G. O., 1865, p. 64; *Circular* 2, S. G. O., 1869, pp. 37, 135.)

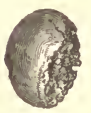

FIG. 66.—Excised head of right femur. *Spec.* 329.

CASE 259.—Lieutenant *D. N. Patterson*, 46th Virginia, aged 31 years, was wounded at an engagement on the Boydton Plank Road, near Petersburg, March 29, 1865, and was captured and sent to City Point, and immediately conveyed on an hospital transport to Washington, and placed in Armory Square Hospital on April 2d. On examination, it was found that a conoidal ball had entered the left thigh behind the trochanter major, and had passed inward and forward, fracturing the trochanter, neck, and head of the femur, and the anterior border of the acetabulum. On the day after the patient's admission, five days subsequent to the reception of the injury, Surgeon D. W. Bliss, U. S. V., in charge of the hospital, decided that the case was one in which excision of the upper extremity of the femur was applicable. The wounded man was anxious that an operation should be performed, and his general condition was very satisfactory. On April 3d he was placed under the influence of chloroform, and Surgeon Bliss exposed the fractured bone by a curvilinear incision with its convexity forward. The shattered fragments of the neck were extracted, the rent in the capsular ligament was enlarged and the round ligament was divided, and the head of the femur was exarticulated. It was found that the ball had not only comminuted the head, neck, and great trochanter, but that fissures extended down the shaft of the femur. The bone was divided by the chain saw two inches below the trochanter minor. The deep wound was now washed out, and small fragments of bone were removed, and search was made for the ball. It was finally detected by means of a Nélaton probe deeply buried in the obturator muscle near the posterior margin of the obturator foramen. The operation was accomplished with little loss of blood, and the patient reacted satisfactorily. The wound was lightly dressed, sufficient outlet for discharges being left, and the limb was extended and supported by pillows. Careful nursing was provided, and such stimulants and concentrated nourishment as seemed best adapted to the patient's condition. For three days he progressed very satisfactorily. Notwithstanding the extensive lesions of the pelvis, which were not detected until after death, there was no indication of peritonitis or disturbance of the urinary organs. On April 7th, however, profuse hæmorrhage

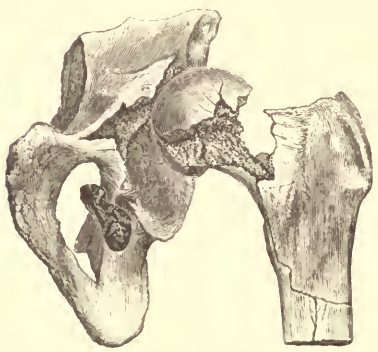

FIG. 67.—Extensive fractures of the shaft, trochanters, head, and neck of the left femur, and of the os innominatum. *Spec.* 4048.

[1] BATES (S. P.) (*History of Pennsylvania Volunteers*, 1861–5, Harrisburg, 1869, Vol. I, p. 30) records the name of this patient as Philip Mechling, Co. I, 11th Pennsylvania Volunteers.

took place, which could not be controlled, and the patient died on the morning of that day. At the autopsy it was found that the bleeding had proceeded from the internal iliac vein, gradually worn away by a sharp bit of bone forced inward by the ball. The pathological specimen, represented in the adjoining wood-cut (FIG. 67), is also figured at page 246 of the Catalogue of the Surgical Section of the Army Medical Museum, where another view is given.

CASE 260.—"I have the honor to report," writes Dr. Hooton, "that I did not take charge of hospital 21 until March 10, 1863, and did not treat the case referred to. I was somewhat conversant with its history, however, and will give it to you as I received it from Surgeon Sennet, 94th Ohio, whom I relieved. The wound was received at the battle of Stone River or Murfreesboro', the last of December, 1862, or January 1, 1863. Resection of the upper part of the shaft, including the shattered trochanters, was performed on the field. The head of the bone was left in the cotyloid cavity. A few days subsequently the patient was sent by rail to Nashville, a distance of twenty miles. Notwithstanding the fatigue of the long journey, his general condition was very satisfactory, and the wound looked well. Part of the incision healed; but there was a profuse discharge from the lower part, and gradually this discharge became thin and ichorous. About January 21st it was determined to reopen the wound. It was found that the head of the bone was carious throughout its whole extent. It was therefore removed After this operation, which was accomplished without hæmorrhage or other untoward circumstance, the limb swelled very much, irritative fever set in, and the patient died exhausted in a few days." [The records of the hospital identify this patient as Sergeant Dallas W. Hade, Co. H, 101st Ohio, wounded at Stone River, December 31, 1862; died January 31, 1863.]

Of the twenty-two intermediary excisions at the hip, four were on the right side, sixteen on the left; in two cases the side of the injury was not reported. A straight longitudinal incision was made in nine instances, a curvilinear in seven, a crucial in one, a T-shaped in one, and in four operations the mode of incision was not stated. In five instances the missile was removed at the time of the operation. Twenty excisions were performed by Union surgeons and two by Confederate surgeons. Pathological specimens illustrating thirteen of the excisions are preserved in the Army Medical Museum, with photographs of the two survivors of intermediary excisions at the hip.

TABLE XII.

Summary of Twenty-two Cases of Intermediary Excision at the Hip Joint for Shot Injury.

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATE OF INJURY.	NATURE OF INJURY.	DATE OF OPERATION.	OPERATION AND OPERATOR.	RESULT AND REMARKS.
1	[1] *Jarret, J. M.*, Lieut., C, 15th North Carolina, age 28.	Oct. 14, 1863.	Left femur shattered at upper third by a conoidal ball.	Nov. 9, 1863.	Excis'n of head, neck, trochanters, and a port'n of shaft of left femur; several large detached fragments and spiculæ rem'd, by Surgeon J. B. Read, P. A. C. S.; chloroform; straight incision seven inches long.	September, 1864. Recovered.
2	[2] Wright, H., Pt., G, 8th N. Jersey, age 28.	May 5, 1864.	Conoidal ball shattered the neck and trochanters of right femur and lodged, greatly flattened and distorted, amid the fragments of bones.	May 27, 1864.	Head, neck, and both trochanters of right femur removed thro' straight incision; missile extracted; jagged upper extremity of shaft turned out and smoothed off, by Ass't Surg. G. A. Mursick, U. S. V.	Disch'd October 6, 1864, and pensioned. *Spec.* 3375, A. M. M. Sept. 4, 1873, "Six and a half inches shortening." Pensioner died October 26, 1874, of heart disease.
3	Boyle, P., Pt., D, 59th Massachusetts, age 60.	July 30, 1864.	Conoidal ball perforated surgical neck of the left femur and fractured trochanter major.	Aug. 5, 1864.	Head, neck, and shaft of left femur at level of troch minor, excised through straight incision, by Ass't Surgeon W. Thomson, U. S. A.; ether.	Died August 7, 1864, from exhaustion. *Spec.* 3593, A. M. M. *Circ.* 6, S. G. O., 1865, p. 70. *Circ.* 2, S. G. O., 1869, pp. 45, 136.
4	*Brantley, G. W.*, Pt., C, 2d Alabama, age 18.	April 9, 1865.	Conoidal ball fractured neck of left femur; also fract. of extl. condyle hum.	April 28, 1865.	Head, neck, and trochanters of femur excised, by Surg. A. M. McMahon, U. S. V.	Died May 2, 1865, of capillary hæmorrhage. *Circ.* 6, S. G. O., 1865, p. 74. *Circ.* 2, S. G. O., 1869, pp. 47, 136.

8	Ewing, A., Pt., A, 140th Pennsylvania, age 30.	May 12, 1864.	Conoidal ball splintered neck, separated the great trochanter from shaft, and comminuted upper part of the left femur. The fissure extended within the capsule.	May 19, 1864.	Removal of the head and fragments of the neck and trochanters through an incision five inches long, by A. A. Surgeon J. F. Thompson.	Died May 24, 1864, from exhaustion. *Circ.* 6, S. G. O., 1865, p. 68. *Circ.* 2, S. G. O., 1869, pp. 43, 135.
9	*Foulke, T. E.*, Pt., D, 2d Alabama, age 17.	April 9, 1865.	Neck, trochanters, and upper third of left femur fractured by a conoidal ball, which lodged above the ant. sup. spinous process of the left ilium. Missile removed.	April 27, 1865.	Excision of the head, neck, trochanters, and two inches of the shaft of femur, by Surg. A. M. McMahon, U. S. V.	Died June 5, 1865, from exhaustion. *Circ.* 6, S. G. O., 1865, p. 74. *Circ.* 2, S. G. O., 1869, pp. 47, 136.
10	Hade, D. W., Sergeant, H, 101st Ohio.	Dec. 31, 1862.	Shot fracture of the trochanters of —— femur; resection of the upper part of the shaft and the shattered trochanters on the field; head of bone left in cotyloid cavity.	Jan. 21, 1863.	On reopening the wound the head of the femur was found carious throughout its entire extent; it was therefore removed, by Surg. E. Sennet, 94th Ohio.	Died January 31, 1863, from exhaustion. *Circ.* 2, S. G. O., 1869, pp. 38, 135.
11	Marston, C. E., Pt., F, 1st Massachusetts, age 19.	Aug. 30, 1862.	Neck of right femur crushed, and the head of the bone comminuted by a conoidal ball, which lodged in the inner side of the thigh.	Sept. 27, 1862.	Fragments of neck removed, head of bone exarticulated, the roughened portion of the neck at its attachment with the trochanter sawn off with a small chain saw, and the missile removed with difficulty at the bottom of a large cavity; slightly curved incision, by Ass't Surgs. B. A. Clements and C. H. Alden, U. S. A.	Died Sept. 30, 1862. *Spec.* 328, A. M. M. *Circ.* 6, S. G. O., 1865, p. 64. *Circ.* 2, S. G. O., 1869, pp. 36, 135.
12	Machlin, F., Pt., I, 11th Pennsylvania.	Aug. 30, 1862.	Comminution of neck of right femur by a musket ball; fissure extending into the head of the bone.	Sept. 20, 1862.	Loose fragm'ts removed, irregular broken extremity of shaft excised, and head of bone disarticulated; incis'n five inches long; Ass't Surg. B. A. Clements, U. S. A., assisted by Dr. G. K. Smith, of Brooklyn.	Died Sept. 21, 1862. *Spec.* 329, A. M. M. *Circ.* 6, S. G. O., 1865, p. 64. *Circ.* 2, S. G. O., 1869, pp. 37, 135.
13	Miller, J., Pt., E, 162d N. York, age 38.	June 14, 1863.	Conoidal ball perforated upper portion of left thigh, breaking the neck of femur transversely and splitting it longitudinally, but without great comminut'n.	July 8, 1863.	Ass't Surg. G. W. Avery, 9th Conn., excised the head, neck, and great trochanter through a single straight incision.	Died Sept. 21, 1863, from exhaustion. *Circ.* 2, S. G. O., 1869, pp. 38, 135.
14	Noe, D. M., Pt., C, 46th Ohio, age 22.	April 6, 1862.	Neck of left femur shattered by a conoidal ball.	April 16, 1862.	Excision of the head, neck, and trochanters, and three inches of the shaft of femur; incision four inches long, by Surg. G. C. Blackman, U. S. V.	Died April 24, 1862, of pyæmia. *Circ.* 2, S. G. O., 1869, pp. 34, 135.
15	*Patterson, D. N.*, Lieut., 46th Virginia, age 31.	Mar. 29, 1865.	Conoidal ball fractured the trochanter major, neck, and head of the left femur, and anterior border of the acetabulum; fissures extended down shaft. Missile lodged.	April 3, 1865.	Shattered fragm'ts of the neck extracted, head of femur exarticulated, and shaft divided two inches below the trochanter minor, through curvilinear incision; missile removed, by Surg. D. W. Bliss, U. S. V.	Died April 7, 1865, from hæmorrhage. *Spec.* 4048, A. M. M. *Circ.* 6, S. G. O., 1865, p. 72. *Circ.* 2, S. G. O., 1869, pp. 45, 136.
16	Phelan, J., Capt., A, 73d New York, age 22.	May 14, 1864.	Left trochanter major shattered and neck of femur fractured to the head by a conoidal ball, which lodged; many fragm'ts driven into gluteal muscle.	June 3, 1864.	Head of femur exarticulated and the fragments of the neck and trochanter major remov'd, thro' crural incision, by Ass't Surg. C. A. McCall, U. S. A.	Died June 21, 1864, from diarrhœa. *Spec.* 2618, A. M. M. *Circ.* 6, S. G. O., 1865, p. 68. *Circ.* 2, S. G. O., 1869, pp. 44, 136.
17	Phillips, H., Pt., I, 146th New York, age 34.	April 1, 1865.	Conoidal ball crushed in the laminated structure of the anterior surface of neck of left femur, where it lodged. Missile extracted.	April 8, 1865.	Head, neck, and trochanter major removed through a curved incision six or seven inches long, by Ass't Surg. W. F. Norris, U. S. A.	Died April 21, 1865. *Autopsy:* Pleurisy on either side; large subperiosteal abscesses. *Spec.* 3235, A. M. M. *Circ.* 6, S. G. O., 1865, p. 72. *Circ.* 2, S. G. O., 1869, pp. 47, 136.
18	Sennett, H. C., Corp'l. F, 122d New York, age 27.	Mar. 27, 1865.	Left acetabulum fract'd slightly at its up. and post. border by a conoidal ball, which also fractured the head of the bone and lodged in the same.	April 4, 1865.	Head and neck excised thro' a T-shaped incision, by Ass't Surgeon H. Allen, U. S. A.	Died April 8, 1865, from peritonitis. *Spec.* 153, A. M. M. *Circ.* 6, S. G. O., 1865, p. 72. *Circ.* 2, S. G. O., 1869, pp. 46, 136.
19	*Smith, M.*, Pt., F, 38th Virginia.	May 10, 1864.	Conoidal ball fractured the upper portion of the shaft of left femur, passed through the perinæum without injuring the urethra, and through the soft parts of the right hip.	May 12, 1864.	Head, neck, and two inches of the shaft of femur excised, by Surg. C. B. Gibson, C. S. A.	Died May 13, 1864. *Spec.* 5500, A. M. M. *Circ.* 2, S. G. O., 1869, pp. 43, 135.
20	Unknown soldier of General Buell's Army. [Probably Corporal H. F. Smith, 12th Wisconsin.]	Mar. —, 1862.	Neck and trochanters of —— femur shattered by a conoidal ball.	Two days after injury.	Head and splintered upper extremity of femur remov'd thro' a long straight incision, by Surg. A. H. Thurston, U. S. V.	Died one week after operat'n, from surgical fever and suppuration. *Circ.* 6, S. G. O., 1865, p. 62. *Circ.* 2, S. G. O., 1869, pp. 34, 135.
21	Unknown soldier, private of Gen'l Pope's Army.	Aug. 29, 1862.	Conoidal ball split and comminuted the left trochanter major and neck of the femur and lodged in the latter.	Sept. 4, 1862.	Head and fragments of neck of the femur removed; the shaft of femur was then divided at the level of trochanter minor, straight incision, by Assistant Surg. J. S. Billings, U. S. A.	Died Sept. 24, 1862, from exhaustion. *Circ.* 6, S. G. O., 1865, p. 64. *Circ.* 2, S. G. O., 1869, pp. 36, 135.
22	[1] Welsh, M., Pt., H, 10th Kentucky, age 40.	Sept. 20, 1863.	Conoidal ball fractured the neck and head of left femur and lodged. Oct. 1st, ball removed.	Oct. 3, 1863.	Head of femur excised, together with the attached greater portion of the lower surface of the neck of the bone, fragments removed and remaining sharp portions of neck trimmed off; Surg. F. H. Gross, U. S. V.	Died October 25, 1863. *Spec.* 5442, A. M. M.

[1] Gross (S. W.), *Head of the Thigh Bone removed by Excision on account of Gunshot Injury*, in *Am. Jour. Med. Sci.*, 1868, Vol. LV, p. 410. Otis (G. A.), *Observations on some Recent Contributions to the Statistics of Excisions and Amputations at the Hip for Injury*, in *Am. Jour. Med. Sci.*, 1868, Vol. LVI, p. 130. *Circular* No. 2, S. G. O., 1869, pp. 39, 135.

Secondary Excisions.—There were reported eleven secondary excisions at the hip practised on nine Union and two Confederate soldiers, resulting in three recoveries and eight deaths, a mortality rate of 72.7 per cent.[1] The shortest interval between the reception of the injury and the operation was thirty-one days, and the longest eight years and four months. Two of the survivors of secondary excision at the hip are still pensioners in comparatively good health, at a period remote from the date of operation.

CASE 261.—Private Joseph Brown, Co. I, 3d Michigan, aged 38 years, was wounded at the second battle of Bull Run, August 29, 1862, by a musket ball, which passed through the left thigh, fracturing the femur just below the trochanter minor. He laid on the battle field three days, and was then removed to Centreville. On September 11, 1862, he was admitted to Fairfax Seminary Hospital, near Alexandria. The limb was kept in position by appropriate apparatus; but suppuration was profuse, and, on two occasions, fragments of bone were removed from the wound. Early in March, 1863, there was great swelling of the thigh, the discharge became scanty and fetid, and pus burrowed amid the muscles. On March 21st, an exploratory incision was made from three inches above to five inches below the prominence of the great trochanter. The neck and upper extremity of the shaft of the femur were found to be extensively diseased, and excision was decided on. Surgeon D. P. Smith, U. S. V., performed the operation. Difficulty was experienced in separating the muscular attachments from the trochanters, on account of the foliaceous masses of callus that had been thrown out. When this dissection was accomplished, many necrosed fragments were extracted, and the periosteum and new bone were separated by the handle of the scalpel and preserved as far as practicable. The shaft of the femur was then divided by powerful cutting bone forceps, about six inches below the tip of the great trochanter. A screw was driven into the mass of callus, below the trochanters, to be used as a lever in disarticulating the head, but it would not hold, and the bone was seized with large forceps and rotated, so as to facilitate the division of the capsular and round ligaments. The head, neck, and trochanters, and the masses of callus adhering to the trochanters, were then removed. The operation was accomplished with but very trifling hæmorrhage, yet great prostration followed, and the patient rallied slowly. As the anæsthesia passed off, he had much nausea and vomiting. As soon as this subsided, he was given a very full allowance of concentrated nourishment, such as strong beef-tea, eggs, milk, etc, with half an ounce of brandy every two hours. The wound was partially closed; the limb was supported on pillows until the third day, when it was dressed in a Smith's anterior splint. About forty-eight hours after the operation, an erysipelatous blush pervaded the limb, and the constitutional symptoms assumed a typhoid character. A female catheter was passed through the middle of the wound and another at its lower extremity, through which much offensive decomposed serum and grumous blood escaped. The wound was thoroughly washed out through the catheters with warm water impregnated with chlorinated soda. On the fifth day there was a rigor, and hæmorrhage to the extent of six ounces. As the anterior splint did not permit convenient access to the limb, it was removed, and the leg and thigh were suspended in a canvas hammock, the leg being horizontal and the thigh in an almost vertical position. A piece of soft toweling extending from the perinæum to the popliteal space, and, connected by cords with an upright post at the head of the bed, supported the muscles on the sides and under surface of the thigh. The wound freely discharged synovia, bloody serum, and thin pus, until the seventh day, when healthy suppuration was fairly established. During April, 1863, the patient's progress was satisfactory. He was supplied with very nutritious diet, with porter, and cod-liver oil. He took for a time as much as a half a pint of oil daily. During May, the case continued to progress favorably. It was necessary to keep a tube in the wound until June 1st. Previously, whenever it was removed pus would accumulate and burrow. A mesh of suture wire was finally substituted for the tube. This was retained until June 20th, when the patient began to get about on crutches. In the latter part of July the wounds closed. In August, Brown was reported as "well," and on August 23, 1863, he was discharged from the hospital and from the military service of the United States. On March 21, 1864, he wrote from his home in Coopersville, Michigan, that his health was good; that he could get about and attend to home business; could saw and split a little wood for fuel, though his knee was stiff and his leg painful. On the whole, there had been steady improvement. In September, 1865, he again wrote, and stated that his general health was good; that he had some control over the movements of the thigh, being able, when standing on the right foot, to swing the left backward and forward, and to adduct the thigh enough to carry the injured limb across the other. He could bear some weight on the limb, and use but one crutch, with a stirrup for the foot. There had been no fistulous orifices since March 1864, and there was no soreness about the cicatrices. In November, 1865, in accordance with a request from the Surgeon General's Office, Mr. Brown had a photograph (FIG. 69) taken to represent the amount of deformity in his limb. This picture is numbered 110 in the Photograph Series of the Army Medical Museum. It is carefully copied in the accompanying wood-cut. The excised bone is preserved at the Museum, and is numbered 1192, Section I. It is represented in the adjacent wood-cut (FIG. 68). On February 12, 1868, he wrote to the compiler of this report: "I take pleasure in informing you that my

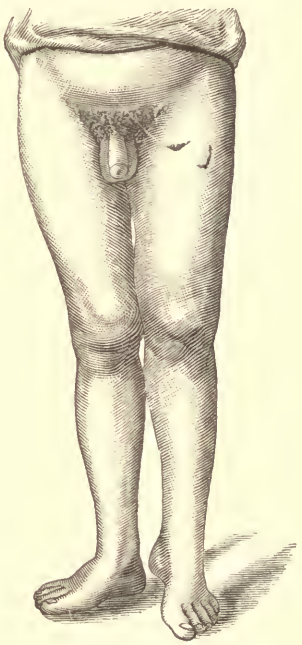

FIG. 69.—Appearance of limb three years after the operation. [From a photograph.]

[1] Besides the nine cases recorded in the *Report on Excisions of the Head of the Femur for Gunshot Injury*, S. G. O., 1869, a successful example has been reported by Dr. E. STERLING, of Cleveland, Ohio, and another successful operation was performed in 1871, by Dr. J. K. BIGELOW of Indianapolis.

limb is in as good condition as when I last wrote you; but think there is no improvement, except that it is not as tender. There have been no abscesses, nor any pain in the limb, excepting slight pains about the knee, just before storms About two years ago, I slipped and fell upon the ice, injuring the limb severely about the knee, and was thereby confined to the house for about three weeks. In March last I had a severe attack of ague. The limb swelled quite badly at this time, and was much inflamed for about ten days. I applied cold water and a bandage to reduce the swelling. I had to keep it bandaged about two weeks after the inflammation was removed. Since that time the limb has given me no more trouble than usual. Since I was discharged I cannot see that there is any lengthening of the limb. I have to use a crutch and cane all the time when moving about, and I think I shall always have to do this. The injured limb has wasted away somewhat since I last wrote. The circumference of the well limb at the upper extremity is 22 inches, and the injured limb measures at the same place 19½ inches. The knee of the well limb measures around the centre of the knee-pan 15½ inches; the injured limb measures at the same place 17 inches. The above measurements were made in the evening; I think that in the morning the measurements of the injured limb would be less. The knee still remains quite stiff, and gives me about all the pain there is anywhere in the limb. I have been troubled during cold weather by coldness of the outer side of the leg, and I have to warm it by the fire before going to bed nearly every night when I have been out." On November 19, 1868, another letter was received from Mr. Brown, from which the following extract is made: "I take pleasure in informing you that my limb is in as good condition as it has been at any time since it was entirely healed, and, if anything, in better condition. It does not pain me about the knee as much as it did one year ago. It does not have any spell of swelling at the knee as it did for the first two years after my discharge, and there is less soreness about the limb than there was even one year ago. I can get around without hurting it as much as formerly. I can bear some weight upon it. I have walked across a room without the aid of crutch or cane, by stepping very quick with the well limb; but it is more like hopping than walking. There have been no abscesses in the limb. I think that it is gradually improving, and hope that I may yet see the day that I can go without a crutch. My general health is good. I have not been sick a day for a year and a half, and then only a few days with ague. My weight now is 167½ pounds. Before I entered the army my weight was never quite up to those figures, but within a few pounds of it. I have been postmaster at this office over a year, and have attended to all the business of the office almost entirely without assistance, and it gives me pretty good exercise." On September 6, 1875, the date of his last examination for pension, the Grand Rapids Examining Board stated: "There is now a false joint with shortening of the limb." Since then this pensioner has been exempted from further surgical examinations. He was paid September 4, 1877, remaining in comparatively good health more than fourteen years after the operation.

The next successful secondary excision at the hip after shot injury was not identified at the Surgeon General's Office until after the publication of *Circular* 2, in 1869.

CASE 262.—G. W. Tilliston, Co. D, 1st Ohio Artillery, aged 44 years, was wounded at Laurel Hill, July 7, 1861, by a rifle ball, which entered the right groin, passing backward through the neck of the femur and lodging in the large muscles of the buttock. Two weeks after the reception of the injury he was mustered out by reason of expiration of service, and subsequently he was admitted on the Pension Rolls. Dr. E. Sterling, of Cleveland, who was the regimental surgeon and treated the wounded man in the field, subsequently certified to the nature of the injury and reported the following: "Extraction of the ball was impossible. The wound was dressed, and within a few days the patient was removed to his home in Cleveland. On or about the 20th of September following it became necessary to remove that portion of the bone traversed by the ball, and I performed the operation of excision at the hip joint." Examiner J. Laisy, of Cleveland, on July 17, 1867, certified to resection of the head and part of the neck of the femur, and stated: "A fistulous opening has formed six inches below the anterior superior spinous process of the ilium, which is keeping up a constant and profuse discharge of purulent matter. The right leg, in consequence of the operation, is shortened about three inches. He is unable to bear any weight on the injured limb, and obliged to walk on crutches." Two years later, in August, 1869, the excised head of the femur, represented in the wood-cut (FIG. 70), was transmitted to the Museum by the operator, who deplored the loss of the other portion of the resected bone, and described the case as being attended with "perfect recovery and a good limb, the pensioner being able to go up and down stairs with ease."[1] Dr. N. M. Jones, attending physician of the pensioner, certified that he died September 6, 1871, and added that a *post-mortem* examination, held by himself, revealed "extensive necrosis of the upper third of the femur * * * and of the ilium, having entirely destroyed the acetabulum and penetrated the pelvis." He also stated that he found an enormous abscess covering the entire right ilium and sacrum.

FIG. 70.—Shattered head of right femur. *Spec.* 5590.

The third successful secondary excision at the hip was practised, in 1871, for ostitis and coxitis, eight years and four months subsequent to the reception of the shot injury.

CASE 263.—Private T. W. Pease, Co. H, 19th Indiana, aged 26 years, was wounded at Gettysburg, July 1, 1863, by a conical musket ball, which entered the anterior aspect of the right thigh three inches below Poupart's ligament, passed backward and outward, and lodged just behind the trochanter major, having fractured the upper third of the femur and passed through the trochanter. The wounded man remained for several months at a Corps hospital at Gettysburg, where merely a "shot wound of right thigh" was noted, but no progress of the case recorded. According to his statement, the missile was extracted by incision three days after the injury, and on July 9th, while under the influence of ether, nearly three inches of bone was removed in fragments. Extension and counter-extension were applied, but the latter caused so much pain that it was discon-

[1] Professor H. CULBERTSON, M. D. (*Excision of the Larger Joints of the Extremities*, Prize Essay, *Trans. Am. Med. Assoc.*, Vol. XXVII, *Supplement*, 1876, pp. 5 and 50), reports this operation as practised "August 20, 1861," which would make it the first excision at the hip after shot injury performed in the United States, the primary excision practised by Professor BLACKMAN, on Private J. McCulloch (CASE 230, p. 97, *ante*) having been done August 30, 1861. Dr. E. STERLING in his letter transmitting the specimen (5590) also asserts that his excision of the head of the femur in Tilliston's case was the first during the war. Pension Examiner LAISY also states that the patient was wounded July 7, 1861, and that resection was performed six weeks afterwards; but, in his official report to the Pension Office, Dr. STERLING states that the operation was performed "on or about the 20th of *September*."

tinued at the end of twenty-four hours. Smith's anterior splints were applied on July 20th, and cold-water dressings were used. The patient also stated that the limb was swollen and painful, the discharge of pus profuse, and his general health bad. For the first two weeks he suffered from constipation, after which, having taken a laxative, diarrhœa set in and troubled him, with short intermissions, for about three months. The records of Camp Letterman Hospital show that the patient was admitted there on September 5th, also that Acting Assistant Surgeon E. A. Koerper took charge of the case on October 8th, who opened a large abscess on the inner side of the thigh on November 3d, and removed the splints several days afterwards, the fracture having become united and the patient's health improved. The subsequent progress of the case was recorded by Acting Assistant Surgeon H. L. Smyser, at the York Hospital, where the patient was transferred on November 14th. The wound of entrance and exit at that time had closed, but there was still discharge from an opening on the middle and external part of the thigh, and the limb was swollen and curved outward, with three inches shortening. After this a steady improvement followed until January 12, 1864, when the patient was seized with a chill, followed by fever, and a deep seated abscess began to form on the anterior part of the thigh, which was opened four days afterwards. Abscesses continued to form at intervals and suppuration was more or less constant, causing the cicatrices of the wound to be reopened. On February 29th, symptoms of tetanus appeared, being exhibited by stiffness of the muscles of the neck and inability of the patient to open his mouth more than half an inch. This attack was subdued, by the administration of pills of camphor and opium, after several days' duration, and during the succeeding night and morning it was followed by an almost constant hiccough, after which another attack of diarrhœa came on. In April following the wound had again healed, and the patient had so far amended as not to require any more medicine. On July 3d, he was able to walk about on crutches for the first time. His term of service having expired, he was mustered out August 8, 1864, and pensioned. Examiner G. W. Clippinger, of Indianapolis, certified, October 17, 1866: * * * "Almost total anchylosis of knee joint, with foot turned inward at the toes; extensive necrosis of entire shaft of bone, with discharge at three points. * * * Discharge offensive and exhaustive. Is feeble and emaciated, has frequent night sweats, and requires constant aid and attendance." Dr. A. L. Lowell, of the Pension Office, who made a special examination of the pensioner on July 20, 1868, reported the following: * * * "The wound is still discharging from its anterior opening and the process of exfoliation is still progressive. The coxofemoral articulation is firmly fixed and immovable. * * * The subject travels with the assistance of crutches. His general health is good." Dr. J. K. Bigelow, attending physician of the pensioner and late Surgeon of the 8th Indiana, reported that he, being aided by Surgeon J. S. Bobbs, "on September 2, 1868, removed ten and a half inches of the necrosed shaft of the femur, said necrosed bone having kept up a constant and exhaustive discharge from three or four large sinuses at various places along the inner and posterior part of the thigh," etc. The Indianapolis Examining Board certified, February 8, 1870: "The pensioner is very obnoxious to erysipelas, which frequently causes large inguinal and popliteal abscesses," etc. Two years afterwards the same Board reported that "the operation for removal of necrosed bone two years ago, apparently resulted in good recovery. * * One year after said operation erysipelas of the limb, with ulceration, etc., again ensued, and on October 20, 1871, he was again attacked with large abscesses, and several sinuses made their appearance. Upon careful examination it was found that the new bone was necrosed and necessitated coxo-femoral exsection, which was performed on the 8th of November, 1871. There is ten inches shortening. He requires the constant attention of a nurse," etc. In a report recapitulating the history of this case, transmitted by Dr. Bigelow, in September, 1877, he describes the operation of exsection as follows: "While under the influence of chloroform, an incision was made from the middle of the dorsum of the right ilium down the outer aspect of the thigh to within two inches of the knee joint. The femur was exposed and divided five inches below the trochanter with Hey's saw, and on account of the extensive perforations of the muscles surrounding the bone by osteophytes (FIG. 71) the epiphysis was with difficulty and considerable hæmorrhage, enucleated and unjointed from the acetabulum. It was found to consist of a very large dead involucrum, filled in all its aspects with sharp projecting spiculæ. A portion of the leaden ball was found embedded in the cancellous structure near the trochanter. The wound healed kindly, and was entirely closed in twenty-eight days. In three months a cartilaginous union had taken place, and now—in September, 1877—with the assistance of a 'six-inch lift' on the right boot the man can walk quite well with a cane, having nearly a perfect arthrodial joint at the hip, and being able to attend to the ordinary duties of a Deputy United States Marshal." In 1873, in visiting the Surgeon General's Office, Dr. J. K. Bigelow contributed a photograph of the excised epiphysis, which is copied in the wood-cut (FIG. 71). In 1877, Dr. Bigelow contributed to the Museum another photograph representing the cicatrix and appearance of the injured limb, which is copied in the right hand wood-cut (FIG. 72). This pensioner was paid September 4, 1877.

FIG. 71.—Shot fracture of trochanter major of right femur. [From a photograph furnished by Dr. BIGELOW.]

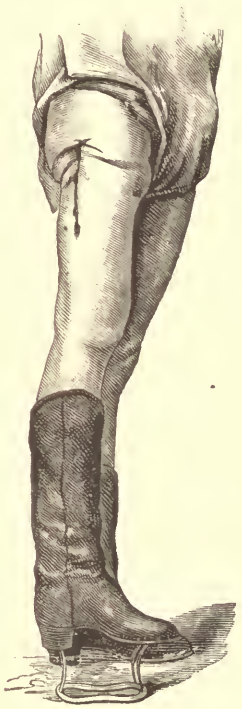

FIG. 72.—Appearance of the limb six years after the operation. [From a photograph.]

The number of patients who servive shot injuries involving the hip joint until the secondary period without operative interference is small; but such cases may be regarded in reference to their ability to sustain excisions as becoming analogous to the subjects of excisions at the hip for pathological causes. Now we learn from the experience of civil practitioners that excisions at the hip for disease have a mortality rate in children averaging perhaps below 45 per cent., yet in adults of the military age rising to an average

of over 60 per cent. It is found on examination, that, as might be anticipated, the secondary excisions at the hip for traumatic cause attain a mortality rate approximating that of excisions for disease in adults of about the same age. The three survivors of secondary excisions at the hip after shot injury were robust mature men of 26, 34, and 44 years of age. In the eight unsuccessful cases the ages varied from 18 to 43 years. In seven of the eight unsuccessful operations the patients succumbed in from one to eight days from the dates of operation, a mean of a little over four days, while the eighth lived over a hundred days after the operation, and succumbed apparently to unfavorable climatic influences and only in part to traumatic causes.

CASE 264.—Private Hugh Frain, Co. G, 31st Massachusetts, aged 22 years, was wounded February 1, 1865, by a conoidal musket ball, which entered the anterior surface of the middle third of the left thigh, ranging upward, and making its exit above the left gluteus, fracturing the neck of the femur in its course. He was on horseback, his regiment serving at the time as mounted infantry. He was treated in the regimental hospital for several days, and then, on February 13th, he was admitted to the St. Louis Hospital, at New Orleans. When admitted, he stated that the surgeon of his regiment had given him chloroform, and examined the wound, and that the bone was not touched. He had walked upon the limb, and there was then no evidence of fracture. His general health became poor. He had night sweats. His tongue was clean and moist, and his appetite was good. The whole thigh gradually became dissected with pus of an unhealthy character. Abscesses discharged through fistulous openings in the groin. The limb was inverted and shortened, and was drawn over to the right. It was decided that an excision of the head of the femur was expedient. On March 24th, Surgeon A. McMahon, U. S. V., proceeded to perform the operation. An incision four inches in length was made over the great trochanter, the soft parts were dissected up, and the femur was divided by the chain saw just below the trochanter minor. The ligamentum teres was softened, and the head of the femur was removed without difficulty. The wound was filled with lint, and the patient was ordered porter, chicken broth, eggs, stimulants, and everything necessary to sustain the drain upon his system. He felt easier for a few days after the operation, but he gradually sank, becoming very much emaciated, and died March 30, 1865, six days after the operation. The ball had injured the neck of the femur, and the subsequent caries had caused the destruction of the head and the disorganization of the surrounding tissues.

CASE 235.—Private Edward Hunt, Co. D, 71st Pennsylvania, aged 24 years, was wounded at the battle of Antietam, September 17, 1862, by a conoidal musket ball, which entered about two and a half inches above the trochanter major, and grazing the neck of the right femur, passed out at the nates. Shortening and eversion were not present, and it was thought that there was not a complete fracture. After the battle, he was removed to a barn near the battle-field, where he was treated with cold-water dressings for eleven days. He was then removed to the City Hotel at Frederick, Maryland, and the cold applications were continued up to November 19th. During this period the wound was discharging healthy pus profusely. As pus was burrowing in the muscles, a seton was run through the wound and six inches down the thigh. On November 19th, he was removed to Jail Street Hospital, and about the last of December he was transferred to the U. S. Hotel Hospital, and thence, on January 20, 1863, to hospital No. 5, at Frederick, Maryland. On January 31st, an abscess formed on the anterior internal aspect of the thigh, which was opened, and discharged nearly a quart of laudable pus in twenty-four hours. On February 2d, the opening on the posterior aspect of the thigh was enlarged and the wound syringed out with warm water. Erysipelas attacked the wound, but it was not of an intense character, and by February 10th, it had subsided, and the patient was in good condition comparatively. On February 23d, he had become more emaciated and had night sweats, but his strength continued good. On exploring for the ball with the finger, in the opening on the inner side of the thigh, a round, smooth surface was felt, which was thought at first to be a piece of a conoidal ball, but was ascertained to be the head of the femur just outside of the acetabulum. Excision of the hip joint was now decided upon, and Assistant Surgeon Henry A. Dubois, U. S. A., operated, the patient being under chloroform, by enlarging the opening on the inner side of the thigh, cutting the capsular ligament, and removing the head of the femur. The neck was divided by the lion-jawed cutting forceps. A small quantity of pus was found behind the head of the bone. But very little blood was lost during the operation, and the patient rallied partially, but he never fully recovered from the shock, and died February 25, 1863, two days after the operation. At the autopsy the neck of the femur was found rounded off, and formed a false centre of motion on the inner side of the acetabulum. The rounded extremity of the neck and the acetabulum were carious. The cut (FIG. 73) imperfectly represents the specimen, which was sent to the Army Medical Museum.

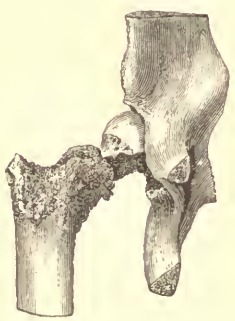

FIG. 73.—Caries of the acetabulum, neck, and trochanters of the right femur, following an excision for shot fracture. *Spec.* 3907. ½

CASE 266.—Ensign *W. J. Henry*, 21st Mississippi, aged 22 years, was wounded near Petersburg, on June 21, 1864, by a conoidal musket ball, which entered the upper third of the left thigh anteriorly and made its exit at the opposite side of the limb, having badly comminuted the femur, without injuring the principal vessels or nerves. The wounded man was conveyed to Richmond, and was admitted to hospital No. 4, on June 28th. The injured limb was suspended by Smith's anterior splint, the wound was dressed with water dressings, a nourishing diet was ordered, with an opiate at bed-time. Under this treatment the case progressed satisfactorily until August 2d, when the copious suppuration and wasting of the patient excited so much anxiety that a consultation was held, at which Surgeons C. B. Gibson, M. Michel, and J. B. Read assisted. After a careful exploration of the injury under chloroform, it was decided that an excision of the upper extremity of the femur was expedient, and the operation was at once performed by Surgeon J. B. Read, P. A. C. S. An incision seven inches in length was made,

commencing above the trochanter and carried downward in the axis of the thigh. The joint was opened and the head of the bone exarticulated. The shaft was sawn below the trochanter minor, about six inches of the bone being removed. The wound being thoroughly cleansed, was approximated and kept in position by sutures and adhesive strips. A long straight splint was then applied on the outside of the limb. An ounce of brandy and thirty drops of tincture of opium was ordered to be administered every hour until reaction should be fully established. August 3d, the patient had reacted and had passed a comfortable night. The pulse was at 136; there was no pain, except in the left knee, which was swollen, but without increased heat or redness. The appetite was poor but improving. A nourishing diet was directed, and half an ounce of brandy every two hours with a grain of opium every three hours. 4th, the patient had rested well, had a good appetite, the tongue was clean, the skin moist, the bowels had been moved naturally, the pulse was at 129, the countenance was cheerful. The treatment was continued with the addition of porter thrice daily. 5th, the pulse was stronger at 120, the countenance was cheerful; the treatment was continued. 6th, the patient was reported to have passed a bad night. He complained of acute pain in his left knee and in the right side of his chest. The pulse was 135 and weak. Incipient pneumonia was detected in the right lung. He had vomited the porter, and it was discontinued; the brandy and opium were continued as before. The wound was suppurating profusely. The sutures were clipped, and the wound was kept together by adhesive strips. The bowels were constipated. An enema of warm soap and water was administered, which procured a normal dejection in a few hours. Sinapisms were applied to the chest. 7th, he had rested tolerably well, but breathed badly. He was sweating profusely, and complained of much pain in the chest. The pulse was at 140, and was very weak. He was ordered an ounce of brandy every hour and a grain of opium every four hours. 8th, he was reported as having passed a very restless night. He was too weak to expectorate; the pulse was very feeble at 148. He was evidently sinking. He died at 3 o'clock P. M., August 8, 1864, six days after the operation, and forty-nine days from the reception of the injury. The report gives no account of the *post-mortem* appearances.

CASE 267.—Private John W. Nelling, Co. K, 1st Massachusetts, aged 25 years, was wounded on June 30, 1862, at the engagement at White Oak Swamp, by a musket ball, which entered his right groin, passed horizontally backward, comminuted the neck of the femur, and emerged posteriorly. He was abandoned with other wounded in the retreat of General McClellan's army. Being made a prisoner, he was confined in Richmond for three weeks, and was then released and sent by water to Baltimore, where he was admitted to the National Hospital, on July 25th, in a very depressed condition. There was copious suppuration, and through the large orifices of entrance and exit it was easy to explore the extent of the injury to the bone, and to determine that the comminution was limited to the epiphysis. It was deemed advisable to excise the shattered extremity of the bone as soon as the patient could acquire, by a tonic treatment, strength to undergo such an operation. In a few weeks his general condition was much improved, though he was still anæmic and feeble. On August 21st, Assistant Surgeon Roberts Bartholow, U. S. A., in charge of the hospital, proceeded to perform the operation. The patient being placed under chloroform, Dr. Bartholow made a vertical incision, commencing a little above and behind the great trochanter, continued downward into the axis of the limb four inches, and carried it down to the bone. The head of the femur was found to be entirely separated from the neck, and was retained in the acetabulum only by the round ligament. This was divided, and the head was removed. Several necrosed fragments were then extracted, and the jagged extremity of the neck was smoothed by an osteotome. But little blood was lost in the operation, and the patient rallied promptly from the effects of the anæsthetic. After he was put to bed, the limb was suspended by Smith's anterior splint, and the patient's condition was rendered comparatively comfortable. The case progressed favorably and without an untoward symptom till the afternoon of August 25th, when a sudden and very profuse gush of dark blood from the wound of incision and the entrance bullet wound took place, and the patient expired before the hæmorrhage could be controlled. At the *post-mortem* examination, the soft parts in the vicinity of the wound were found to be in a softened and semi-gangrenous condition. The end of the excised neck was denuded of periosteum and was necrosed. The external iliac and femoral arteries were traced some distance above and below Poupart's ligament, and were found to be in a normal condition. The femoral vein was softened, and near the track of the ball appeared to be broken down so as not to be distinguished from the surrounding tissues. A quantity of dark fluid blood was found under the integuments. The excised head and neck were deposited in the Army Medical Museum by the operator, and are represented in the cut (FIG. 74).

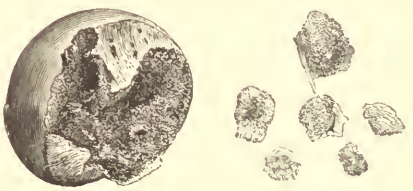

FIG. 74.—Head and fragments of the neck of right femur, excised for gunshot fracture. *Spec.* 400, Sect. I, A. M. M. ½

CASE 268.—Private Joseph Roth, Co. B, 188th New York, aged 25 years, a large robust man, was wounded in the engagement at Hatcher's Run, near Petersburg, on February 6, 1865, by a round musket ball, which entered a little below Poupart's ligament, an inch external to the course of the vessels, and lodged in the neighborhood of the hip joint. He was received at the field hospital of the 1st division of the Fifth Corps, and thence conveyed to the base hospital at City Point, and, as there was no pain or deformity, the case was regarded and treated as a flesh wound, and a week subsequently the patient was sent in the hospital transport steamer State of Maine to the General Hospital at Point Lookout. After a short time, Roth began to complain of great pain in the knee and leg of the wounded limb, which aroused suspicion that the hip joint was implicated. The symptoms becoming aggravated, and pointing clearly to some injury of the joint, Surgeon John Vansant, U. S. A., in charge of the hospital, determined to make an exploratory incision, and to ascertain the true condition of things. The patient being anæsthetized by a mixture of chloroform and ether on March 9th, an incision was made, commencing at the wound of entrance, and continued downward three inches or more. The ball was now found impacted in the head of the femur, the anterior part of which was shattered, while the posterior two-thirds of the head was intact. The muscular attachments being divided, and the capsular ligament freely opened, the round ligament was severed, and the head was exarticulated. A chain saw was then passed around the neck, which was divided near to the head, and the latter, with the ball inserted in it, was removed. Some sharp projecting portions of the neck were smoothed off with bone forceps. There was very little hæmorrhage. The wound was drawn together and treated by water dressings, and the limb was kept in suitable position by pads and pillows. The patient seemed to do well for several weeks, but gradually became feeble and emaciated, losing all appetite. There was

but a slight discharge. In May, the patient became quite yellow, and apparently suffered from malarial complications. In spite of a careful tonic and sustaining regimen, and the bracing, wholesome salt air of Point Lookout, he gradually declined, and died June 17, 1865. The pathological specimen was not forwarded to the Museum, and no account of an autopsy was rendered, an annoying omission, since it would have been interesting to have learned what reparative action had taken place during the three months after the operation which this patient survived.

CASE 269.—Private *Alfred Toney*, Co. A, 16th North Carolina, aged 43 years, a farmer by profession, was wounded June 30, 1863, and admitted to hospital No. 4, Richmond, on the same day. A conoidal musket ball had entered the left buttock and lodged. No particular attention was called to this case for some time. The patient seemed to be doing well. On August 11th, however, he complained of great pain in the knee and ankle; the slightest touch caused great anguish. The foot was œdematous. Chloroform was administered, and digital examination of the wound was made. The finger could pass but half an inch into the wound until the limb was carried forward; it then could be passed into the cotyloid cavity, and the ball was found in the acetabulum. The round ligament was severed and the head of the femur was ascertained to be slightly fractured and deprived of its cartilage. Excision of the head of the femur was decided upon, and on August 12th, Surgeon James B. Read, P. A. C. S., proceeded to operate. The patient was laid on his face, and his buttocks were brought to the edge of the table. A straight incision was commenced two inches below the anterior superior crest of the ilium and carried downward to one inch below the trochanter major. The muscles were then separated, and the joint exposed. The head was then dislocated by forcibly bringing the leg under the table. The soft parts were protected by a spatula and the head was sawn off. The ball was removed from the cotyloid cavity, which was found to be broken across and the cartilage loosened. The wound was then closed by sutures and the patient was removed to his bed. He suffered no pain, and in twenty-four hours the swelling had subsided. His general condition was very feeble, and he was freely stimulated during the after-treatment. He died August 19, 1863, eight days after the operation, exhausted by hectic fever. There is no account of any abdominal disturbance or pyæmic symptoms resulting from the fracture of the acetabulum.

CASE 270.—Private Henry Woodworth, Co. A, 4th Vermont, aged 18 years, was wounded at the battle of Spottsylvania Court House, on May 11, 1864, by a conoidal musket ball, which entered the left thigh, just below the trochanter major, passed inward and forward, grooving the femur anteriorly at the level of the lesser trochanter, and lodging under the sartorius muscle. The patient was conveyed to the field hospital of the 2d division of the Sixth Corps, where the ball was removed through an incision at the edge of the sartorius. A week subsequently, he was placed on one of the trains for the Rappahannock, and was transferred from Fredericksburg to Washington, where, on May 25th, he was admitted to Harewood Hospital. His condition on admission was very unpromising; his pulse was quick and feeble; he was anæmic, and without appetite. He was placed upon a tonic regimen, but he did not improve. The wound discharged profusely; there was much pain in the joint, pain aggravated by the slightest movement, and pus had burrowed in every direction about the articulation. Surgeon R. B. Bontecou, U. S. V., in charge of Harewood Hospital, decided that an excision of the head of the femur offered the only possible chance of saving life, and, on July 1st, the patient having been anæsthetized by sulphuric ether, Dr. Bontecou proceeded to perform the operation. A curved incision, with its concavity forward, embracing the trochanter, readily exposed the joint. The muscular attachments were divided, and the head was easily disarticulated, the joint being disorganized and the round ligament destroyed. The continuity of the bone being uninterrupted, the upper extremity was readily turned out and sawn just below the point of impact of the ball. On examination of the portion of bone removed, it was found that much of the head had been absorbed, and that the remainder was carious. The specimen is represented in the accompanying wood-cut (FIG. 75). The neck and trochanters are covered with traces of the effects of periostitis. The cotyloid cavity was ulcerated. The wound was drawn together by adhesive strips, and the limb was dressed in a fracture apparatus with moderate extension. Every means of supporting the patient's strength was adopted, but he did not rally from the operation, and, sinking gradually, expired on July 2, 1864.

FIG. 75.—Excised upper extremity of left femur with a conoidal ball. *Spec.* 3049. ¼

CASE 271.—Private John Zaborowski, Co. H, 7th Connecticut, aged 33 years, was wounded at the engagement at Deep Bottom, Virginia, August 16, 1864, by a conoidal musket ball, which entered just below the right trochanter major, and passing upward and inward, fractured the neck and slightly injured the head of the femur. The patient was conveyed to the field hospital of the Tenth Corps, where his wound was dressed, and he was then sent to City Point and transferred to the hospital transport steamer De Molay, and conveyed to the U. S. Hospital, at Beverly, New Jersey, where he was admitted on August 22d. His condition at this period is not described, and it is not stated whether the ball had been extracted. From the subsequent history, it would appear that there was profuse suppuration about the joint, since a free transverse incision was practised to give free escape to the discharge. On September 27th it was determined to excise the head of the femur. The patient had greatly lost in flesh and strength since his admission, and seemed to be rapidly failing from the exhaustive suppuration; extensive sloughing of the soft parts had supervened, and, upon the whole, the case was unfavorable and unpromising. Chloroform having been administered, and the patient being placed on his sound side, Assistant Surgeon C. Wagner, U. S. A., made an incision four and a half inches in length, extending from just below the anterior superior spinous process of the ilium toward the tuberosity of the ischium, crossing the transverse incision previously made over the trochanter major to permit free exit of pus. The thigh was flexed and rotated inward, the tendons of the muscles were divided, and a chain saw was passed under and between the head of the femur and the trochanter major, and the bone was sawn through the neck, the soft parts being protected by spatulas. About one inch of the trochanter major was found to be necrosed, and was removed by a small saw. No blood was lost during the operation. The patient sank rapidly, and died September 28, 1864, of exhaustion. A *post-mortem* examination revealed nothing of note, except slight caries of the acetabulum. The carious head of the femur was sent to the Army Medical Museum, and is represented in the adjacent wood-cut (FIG. 76). The fragments of the neck and the necrosed trochanter major were lost.

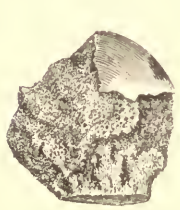

FIG. 76.—Head of right femur excised for caries following a gunshot fracture. *Spec.* 5716, Sect. I, A. M. M. ½

Of the eleven secondary excisions at the hip five were on the right and six on the left side. The pathological specimens were preserved in six instances.

TABLE XIII.

Summary of Eleven Cases of Secondary Excision of the Head of the Femur for Shot Injury.

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATE OF INJURY.	NATURE OF INJURY.	DATE OF OPERATION.	OPERATION AND OPERATOR.	RESULT AND REMARKS.
1	[1] Brown, J., Pt., I, 3d Michigan, age 38.	Aug. 29, 1862.	Musket ball perforated the left thigh, fracturing femur just below the trochanter minor.	Mar. 21, 1863.	Necrosed fragments extracted; shaft of femur divided six ins. below tip of troch. minor. The head, neck, and trochanters, and the masses of callus adhering to the trochanters were then removed, straight incis. eight ins. long, by Surgeon D. P. Smith, U. S. V.	Disch'd Aug. 23, 1863, and pensioned. Appointed postmaster in 1867, at Coopersville, Mich. Able to attend almost entirely without assistance to the business of the office. Paid pension March 4, 1876. *Spec.* 1192, A.M.M. *Phot. Ser.* 110, A.M.M.
2	Tilliston, G. W., Pt., D, 1st Ohio Light Artillery, age 44.	July 7, 1861.	Rifle ball enter'd the right groin, passed backward, fractured the head and neck of femur, and lodged in large muscles of buttock.	Sept. 20, 1861.	Head and neck of femur excised, by Dr. E. Sterling.	(Disch'd July 21, 1861.) July, 1867, fistulous opening discharging purulent matter. Three ins. shortening. Pens'ner died Sept. 6, 1871, of asthenia. Autopsy. *Spec.* 5590, A. M. M.
3	Pease, T. W., Pt., H, 19th Indiana, age 26.	July 1, 1863.	Conoidal ball fractured upper third of right femur, passed thro' trochanter and lodged behind trochanter major, followed by chronic ostitis and coxitis.	Nov. 8, 1871.	Femur divided five ins. below the trochanter and unjointed from acetabulum, by Dr. J. K. Bigelow, late Surgeon 8th Indiana.	Portions of femur had been previously removed. Patient had been disch'd Aug. 8, 1864. In Sept., 1876, the pensioner had "nearly a perfect arthrodial joint at hip, and was able to attend to the ordinary duties of a deputy marshal."
4	Frain, H., Pt., G, 31st Massachusetts, age 22.	Feb. 1, 1865.	Left thigh perforated by a conoidal ball; the neck of the femur was fractured.	Mar. 24, 1865.	The femur was divided by the chain saw just below the trochanter minor; the head of the femur was removed without difficulty; Surg. A. M. McMahon, U. S. V. Incision four ins. long.	Died March 30, 1865. *Circ.* 6, S. G. O., 1865, p. 72. *Circ.* 2, S. G. O., 1869, pp. 54, 137.
5	*Henry, W. J.*, Ensign, 21st Mississippi, age 22.	June 21, 1864.	Comminuted shot fracture of upper third of left femer by a conoidal musket ball.	Aug. 2, 1864.	Head of femur exarticulated, shaft sawn below trochanter minor, six inches of bone removed, by Surg. J. B. Read, C. S.A. Incis. seven ins. long.	Died August 8, 1864. *Circ.* 2, S. G. O., 1869, pp. 52, 137.
6	Hunt, E., Pt., D, 71st Pennsylvania, age 24.	Sept. 17, 1862.	Conoidal ball grazed the neck of the right femur and passed out at the nates.	Feb. 23, 1863.	Opening on inner side of thigh enlarged, neck of the femur divided with lion-jawed forceps and head of bone removed, by Ass't Surg. H. A. DuBois, U. S. A.	Died Feb. 25, 1863. *Spec.* 3907, A. M. M. *Circ.* 6, S. G. O., 1865, p. 66. *Circ.* 2, 1869, S. G. O., pp. 49, 137.
7	Nelling, J. W., Pt., K, 1st Massachusetts, age 25.	June 30, 1862.	Musket ball comminuted neck of right femur; head of bone entirely separated.	Aug. 21, 1862.	Head of bone removed, several fragments extracted, and the jagged extremity of the neck smoothed by an osteotome, by Ass't Surg. R. Bartholow, U. S. A., thro' vertical incis.	Died August 25, 1862, of hæmorrhage. *Spec.* 400, A. M. M. *Circ.* 6, S. G. O., 1865, p. 62. *Circ.* 2, S. G. O., 1869, pp. 48, 137.
8	Roth, J., Pt., B, 188th N. York, age 25.	Feb. 6, 1865.	Anterior part of head of left femur shattered by a round ball, which lodged in same.	Mar. 9, 1865.	The neck of the femur was divided near the head of the bone by a chain saw; the head of the bone with the ball inserted was then removed, straight incision, by Assistant Surg. J. Vansant, U. S. A.	Died June 17, 1865. *Circ.* 6, S. G. O., 1865, p. 74. *Circ.* 2, S. G. O., 1869, pp. 53, 137.
9	[2] *Toney, A.*, Pt., A, 16th N. Carolina, age 43.	June 30, 1863.	Head of the left femur slightly fractured by a conoidal ball that lodged in acetabulum.	Aug. 12, 1863.	Head of femur sawn off and the ball removed from the cotyloid cavity, by Surg. J. B. Read, P. A. C. S.; straight incision.	Died August 19, 1863, from exhaustion, of hectic fever.
10	Woodworth, H., Pt., A, 4th Vermont, age 18.	May 11, 1864.	A conoidal ball grooved the left femur anteriorly at the level of the lesser trochanter and lodged under the sartorius muscle and was removed.	July 1, 1864.	Head of femur disarticulated and upper extremity of bone readily turned out and sawn just below the point of impact of the ball, by Surg. R. B. Bontecou, U. S. V.; curved incision.	Died July 2, 1864. *Spec.* 3049, A. M. M. *Circ.* 6, S. G. O., 1865, p. 70. *Circ.* 2, S. G. O., 1869, pp. 52, 137.
11	[3] Zaborowski, J., Pt., H, 7th Connecticut, age 33.	Aug. 16, 1864.	Conoidal ball fractured the neck and slightly injured the head of the right femur.	Sept. 27, 1864.	Chain saw passed under and between the head of femur and trochanter major and the bone sawn through the neck; an inch of trochanter major, found to be necrosed, removed by small saw, by Ass't Surg. C. Wagner, U. S. A.; crucial incision.	Died September 28, 1864, from exhaustion. *Spec.* 3716, A. M. M.

Since the termination of the civil war the operation of excision at the hip for shot injury has been practised five times in the service of the United States Army and once in the service of the United States Navy, and this aggregate of six excisions[1] gives the

[1] Four of the operations are described at length in *A Report of Surgical Cases treated in the Army of the United States from* 1865 *to* 1871, *Circular* No. 3, War Department, Surgeon General's Office, Washington, 1871, pp. 228–234, and the facts regarding them will be here briefly recorded, two of the cases are hitherto unpublished, and will be narrated more in detail. Two of the excisions were primary, one intermediary, and three secondary operations. The first case was that of Private Hubert Erne, Co. D, 4th Infantry, aged 48 years, wounded December 2, 1869, while acting as one of a corporal's guard of the mail wagon from Fort Laramie to Fort Fetterman, in an attack by a band of Indians. He was struck in the left buttock by a round carbine ball (cal. 45, weight 225 grains), and fell to the ground. His comrades placed him in a wagon and drove rapidly to Laramie, over a very rough road; he was struck at two in the afternoon and was placed in bed in the hospital at half-past seven, much exhausted, having driven thirty-two miles in five and a half hours. He had lost blood copiously. His extremities were cold, pulse almost imperceptible, and his countenance was pallid and covered with clammy sweat. The left lower limb showed shortening with eversion, the thigh arched with an anterior convexity. The entrance wound was an inch and a half behind the trochanter major on a slightly higher plane; the exit aperture was near the centre of the groin just below Poupart's ligament, directly over the axis of the femoral artery. The diagnosis of Assistant Surgeon F. MEACHAM, post surgeon, was that there was fracture of the shaft, neck, and trochanters of the left femur. As he had not rallied from the shock, it was thought best to defer surgical interference until morning, and the limb was placed in a comfortable position, and the patient allowed half an ounce of brandy every half hour, while external applications of heat were made by hot blankets, heated sad-irons, and bottles of hot water. At midnight the patient had fairly reacted; but complained of great pain in the middle of the injured thigh. He was ordered a fourth of a grain of morphia to be repeated in two hours if needed. At 7.30 A. M., December 3d, the patient was comfortable; pulse at 90. No appetite and little sleep during the night. Temperature in axilla 99° F. Cold-water dressings to wound were applied, milk punch given freely, and an eighth of a grain of sulphate of morphia every two hours. At 1 P. M. Dr. MEACHAM, assisted by Assistant Surgeon J. B. GIRARD, U. S. A., placed the patient under chloroform and thoroughly explored the injury, after enlarging the entrance wound to admit the finger to ascertain the extent of shattering of the neck, trochanters, and shaft. No important vessels or nerves were involved. The patient was an old soldier; he had been a hard drinker; during the civil war had been more than once wounded, having on one occasion suffered a shot fracture of the lower jaw. After careful consideration of the local and constitutional conditions it was determined that excision of the upper extremity of the femur would afford the patient the best chance of life. Dr. MEACHAM made a curvilinear incision seven inches in length, beginning an inch and a half above the trochanter major, traversing the entrance wound and extending downward in the axis of the shaft. Exposing the bone by rapid division of the muscular attachments, the fragments of the shaft were first removed and the pointed upper extremity of the shaft was then divided by the chain saw; then, with some difficulty, the head of the bone was exarticulated, and the operation completed. The exploratory incisions, consultation, and final excision occupied nearly an hour. Little blood was lost, and the patient promptly rallied, with little sign of shock. The upper part of the incision was united by sutures and adhesive strips. The man was put to bed with the injured limb extended, and a weight of four pounds attached by Buck's method. The wound had cold-water dressings, and the patient had an ounce of brandy every hour when awake, and a quarter of a grain of sulphate of morphia every two hours. December 4th, the patient had passed a good night, and had a full pulse at 90. During the day he had nutritious diet, a half ounce of brandy hourly if awake, and two grains of quinia and an eighth of a grain of sulphate of morphia every four hours. Excised fragments of bone were cleaned and sent to the Army Medical Museum and preserved as Specimen 5658, of the Surgical Section, which are represented one-fourth the size of nature (FIG. 78). On December 5th, in the early morning, there was little change in the constitutional symptoms. The patient had slept four hours during the night. He was troubled with hiccough. He had partaken freely of freshly prepared essence of beef. At the surgeon's morning visit, at half past seven, twenty-grain doses of bromide of potassium were substituted for the morphia, and the other treatment and diet were continued, with the addition of canned oyster soup. At the evening visit, at nine, the hiccough had nearly ceased, the wound had begun to suppurate, the pulse was 100, the tongue was moist, and the thirst diminished. The dose of bromide of potassium was reduced one-half; the other treatment was continued. On the morning of December 6th he was found to have passed a restless night, annoyed by hiccough when awake. He complained of the extension, and the weight attached to his foot was diminished one-half. Whiskey was substituted for the brandy which he disliked, and a tincture of sesquichloride of iron was given in twenty-drop doses, with two grains of sulphate of quinia every four hours. One-fourth of a grain of sulphate of morphia was ordered to be given when the pain demanded it. The patient was removed to a water-bed. On December 7th the patient was more comfortable and had slept well. He was annoyed by flatulence, the bowels not having moved since the reception of the injury. He was ordered a tablespoonful of castor oil and twenty drops of turpentine, and an enema of soap and water. The suppuration from the wound was quite copious. On the following day it was practicable to omit the anodyne, and the patient had a free evacuation of the bowels, with great relief. The patient was allowed a small piece of beef-steak for his breakfast, and chicken for dinner. The discharge from the wound was profuse, and the integument over the hips and nates was somewhat abraded from heat and moisture. The weight attached to the foot was removed altogether. The patient was transferred from the water-bed to a mattress, in the middle of which was a movable portion corresponding with the pelvic region. This arrangement greatly facilitated the application of dressings and the use of a bed-pan. The patient was ordered three ounces of beef essence thrice daily and as much milk as he should relish. On the 9th, he was found to have slept well without taking an anodyne. The suppuration was profuse. The pulse was at 100. The appetite was abundant. Hiccough was again quite troublesome. The bowels had not been moved since the 7th, and an enema of castile soap and warm water was ordered to be given daily, unless there should be an alvine evacuation before nine in the morning. During the next fortnight there were no symptoms of especial interest. The wound continued to suppurate, but less copiously, and was rapidly filling up with granulations. On December 23d the patient passed a very restless night. The surface was hot, and the pulse at 100; the appetite was gone; the abdomen was tympanitic. On December 23d, he had several dejections, and had slept soundly during the previous night, and was in every respect much better. On January 1, 1870, his bowels were again obstinately constipated. Cicatrization of the wound was rapidly going on. Citrate of iron and quinine was substituted for the sesquichloride of iron. Laxative enemata were required daily, and whiskey was still given. The obstinate hiccough ceased about the middle of January, at which date the pulse had fallen to an average of 90, and the wound had far advanced toward healing. For the next six weeks there was very little change in the daily record. The patient's convalescence progressed favorably, and by February 28th the wound was open at two points only. Constipation was still a troublesome complication; the patient being annoyed by injections he was ordered to take a three-grain compound cathartic pill nightly. By the end of March the patient was able to sit up. There were still two fistulous sinuses leading

FIG. 77.—Cicatrix in Meacham's case of successful excision of the left hip. [From a photograph.]

gratifying result of four recoveries. Adding to the sixty-six cases of excision at the hip for shot injury performed during the War of the Rebellion the ninety-nine cases referred to in Note 1 on page 90 *ante*, and the six cases detailed in Note 1 commencing on page

toward the cotyloid cavity. About an ounce of pus was discharged daily. The limb was about five inches shorter than the other. On April 10th the patient got on crutches, but could not walk far without fatigue. For the next twenty days he seemed disinclined to exert himself but was taken out every day in a wheeled litter. One of the sinuses had closed. By July 8th the patient had gained in flesh and strength, and the purulent discharge had diminished to a few drops daily. The limb was swollen considerably and there was an erysipelatous blush extending below the knee. At this date Dr. MEACHAM was ordered to Omaha, and the patient passed into the hands of Acting Assistant Surgeon L. S. TESSON, who, on July 29th, wrote to Dr. MEACHAM that quite a large abscess formed in the muscles of the thigh. On August 9th, Dr. TESSON again wrote that it had been necessary twice to make incisions to evacuate abscesses in the thigh. Again, on March 9, 1871, Acting Assistant Surgeon A. J. HOGG writes that the man is entirely well, the cicatrix being perfectly sound; but the man persisted in lying in bed. On April 1, 1871, Dr. MEACHAM reports that he had succeeded in getting his patient again under his personal observation, previous to which he had borne transportation in an ambulance for ninety miles, and appeared in better spirits at the end of the journey than when he set out. The wound had entirely healed, leaving a firm and sound cicatrix three inches in length. The patient was able to walk comfortably on crutches and had slight control over the limb, which admitted of a to-and-fro motion, with rotation inward. The upper end of the femur rested on the dorsum of the ilium, about one inch above the acetabulum, and was movable in that position. There was six and a half inches shortening. The patient was somewhat hypochondriacal, being greatly troubled with indigestion and irregular bowels. A photograph of the patient, taken at Omaha, March 30, 1871, is copied in the wood-cut (FIG. 77). Private Hubert Erne was discharged from service May 18, 1871, and by an order dated A. G. O., June 9, 1871, was sent to the Soldier's Home, near Washington. In answer to an enquiry from this Office, Surgeon C. H. LAUB reported: "Hubert Erne, late of the 4th Infantry, was received in hospital at Soldier's Home on July 16, 1871, in a very emaciated and feeble condition, the result of chronic diarrhœa. Having during his residence here exhibited symptoms of partial insanity, and having no facilities for the proper care of such cases, he was transferred to the Government Insane Asylum, near Washington, August 20, 1871, at which place it is reported that he died a short time after his admission." Then Dr. C. H. NICHOLS, Superintendent of the Government Hospital for the Insane, reported that the patient "was admitted August 19, 1871, to be treated for acute insanity, and that he died Nov. 7, 1871, from exhaustion, of acute mania. No autopsy was made in the case." Another primary excision at the hip for shot fracture of the upper extremity of the femur was practised at Fort Concho, Texas, in 1874, by Assistant Surgeon W. F. BUCHANAN, U. S. A. The fracture was attended with very extensive longitudinal splintering, and it would appear that such conditions involve incisions of such perilous magnitude as to afford the slightest prospects of success even under the most favorable attendant circumstances. The abstract of this case has not, at this date, (June 1, 1878), been published in print.—Sergeant T. Duncan, Co. K, 25th Infantry (Colored), aged 27, was shot in the left hip while a prisoner and attempting to escape from his guard at Fort Concho, Texas, on the morning of November 21, 1874. On receiving the injury, which was produced by a conical rifle ball at a distance of about sixty yards, he fell to the ground, when he was placed on a wheeled litter and was conveyed to the Post Hospital. At 9.20 A. M. an ounce of brandy with half a grain of morphia was administered. An examination externally exhibited a wound of entrance in the gluteal region, on a line with the lower border of the great trochanter, and about mid-

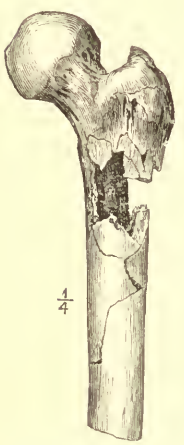

FIG. 79.—Shattered upper extremity of the left femur. *Spec.* 6513.

FIG. 80.—Posterior view of the same specimen.

way between the trochanter and the tuberosity of the ischium; the wound of exit existed in the anterior part of the thigh, same side, about an inch and a half below Poupart's ligament and one inch external to the femoral vessels. The mobility, crepitus, probing, etc., proved that the upper part of the shaft of the femur had been shattered; a compound comminuted fracture, doubtless extending within the capsule. Venous hæmorrhage was taking place from the wound in the gluteal region, and great pain was felt in touching the great trochanter and in the knee. There was also great nervousness, and quick and feeble pulse. He was placed on his right side, the injured leg supported, the body bolstered, and the hæmorrhage controlled by pledgets of lint saturated with a solution of persulphate of iron. Cold-water dressing was applied, a tin warmer filled with hot water applied to the feet, and a quarter of a grain of sulphate of morphia together with an ounce of brandy was given every two or three hours. On the following day, at 11.30 A. M., the patient was quite nervous, suffering great pain, and only relieved by the full effects of the anodyne, having slept little during the night and eaten nothing but a little beef essence; pulse 120 and small; temperature normal. It was decided that resection offered him the only chance to survive. He was therefore placed on the operating table and brought under the influence of the anæsthetic, consisting of one part of chloroform and two of ether, when a longitudinal incision about eight inches in length was made, commencing just above the trochanter and extending in the axis of the head and neck of the bone, and the soft parts were dissected away. The upper end of the shaft being found much shattered and the fracture extending within the neck, the head of the bone was exarticulated and the fractured extremity removed with the chain saw. About five inches of the shaft, with the head and neck, were exsected. No arteries were cut, and but one small vein was ligated. All the fragments of bone, about forty, were removed, the parts washed out and a weak solution of permanganate of potassa applied, the sides of the wound being united with interrupted sutures supported by adhesive straps. The patient was then placed in bed, position maintained by sand bags, and cold-water dressings instituted. As soon as he had recovered consciousness, brandy and morphia were given and repeated frequently. Warmth was applied to the feet. The patient was of great muscular development, and the incision required to be lengthened an inch or so to allow of necessary retraction. His pulse was about the same as before the operation, rather full. Although relieved of the pain he had suffered previous to the operation, he continued restless, constantly trying to change his position, groaning, etc., and died on the morning of November 26th, about fourteen hours after the operation." The exeised portion of the fractured femur, represented in the wood-cuts (FIGS. 79, 80), with the history, was contributed to the Museum by the operator, Assistant Surgeon W. F. BUCHANAN, U. S. A. Of the excisions at the hip after shot injury, practised since the close of the civil war in the United States Army, one was an intermediary operation performed by Surgeon GLOVER PERIN, U. S. A., at Newport Barracks, Kentucky, in August, 1867: CASE.—Private Francis Ahearn, aged 30 years, U. S. General Service, was wounded at Newport Barracks, Louisville, on July 31, 1867. He was a prisoner in the guard-house, and was shot by a sentinel while attempting to escape. The ball entered behind and below the prominence of the right trochanter major and passed inward and upward, emerging on the anterior part of the thigh, two inches below Poupart's ligament, a little to the outside of the course of the femoral artery, having shattered the upper part of the femur, the fissures extending within the joint. The wounded man was immediately taken to the Post Hospital, and was examined by Colonel PERIN, the surgeon in charge. The patient had been an habitual drunkard for years and had *mania a potu* when shot. The shock of the injury was so great that an operation was not considered advisable. It was determined to adopt a supporting treatment, and to endeavor to build up the general health, with a view of operating at the first favorable moment when a good result could be reasonably anticipated. On August 26, 1867, the patient was in a better condition than at any time subsequent to the reception of the injury. The pulse was at 90; there had been troublesome diarrhœa, but it was somewhat abated; the injured limb was much wasted, except at the upper part of the thigh, where it was greatly swollen: the discharge from the wound was very copious, and there was extreme pain on the slightest movement. There were abscesses about the joint communicating with its cavity. Excision having been decided upon, Surgeon PERIN, assisted by Assistant Surgeon T. E. WILCOX, U. S. A., proceeded with the operation. The patient being rendered insensible by a mixture of chloroform and ether, the entrance wound was enlarged by a straight incision downward and three

120, we have a total of one hundred and seventy-one instances of excision at the hip for shot injury, of which one hundred and forty-eight, or 86.5 per cent. proved fatal. Forty-three of the operations were primary, with forty deaths, or 93 per cent.; sixty were inter-

inches in length. The head of the bone was disarticulated, and the shaft was sawn several inches below the lesser trochanter. The wound was then cleansed and approximated. Scarcely any hæmorrhage took place, no ligatures being required. On recovering from the anæsthetic, the patient complained of great pain and nausea. Brandy was administered, and half a grain of sulphate of morphia; but there was such irritability of stomach that everything was rejected. A quarter of a grain of sulphate of morphia was then administered hypodermically, and this relieved the pain. But there was no decided reaction, and, sinking gradually, the patient died from the shock of the operation twenty hours after its completion. No autopsy was made. The shattered excised bones were sent to the Army Medical Museum, and are represented in the adjoining wood-cuts (FIGS. 81, 82). Many of the fragments were carious. Of the six cases of excision at the hip joint practised on account of shot injury in the United States since the civil war, three were successful secondary operations. Two occurred in the United States Army and one in the United States Navy. The first of the operations was performed by Assistant Surgeon J. R. GIBSON, in August, 1868. The patient recovered with a very satisfactory control of the functions of the articulation and limb. A detailed report of the case was published in *Circular* No. 2, S. G. O., 1869, pp. 117-120, and in *Circular* No. 3. S. G. O., 1871, p. 228, an account of the pensioner's progress was given, with a lithograph plate showing the appearance of the injured limb three years subsequent to the operation. The following is the condensed abstract of the case as published in *Circular* No. 3: "Private Charles F. Read, Co. I, 37th Infantry, while in a stooping posture, and distant about one hundred feet, was shot by a sentinel at Missouri Bottom, New Mexico, on June 6, 1868. The ball struck about the middle of the posterior aspect of the left thigh, causing an injury to the bone, the nature of which is shown in the accompanying wood-cut (FIG. 84), illustrating the specimen contributed to the Army Medical Museum by the operator, Assistant Surgeon J. R. GIBSON, U. S. A. The case being fully detailed in *Circular* No. 2, S. G. O., 1869, page 117, reference will only be made to the more salient points, and to information received since the publication of that report. After weeks of temporization, during which the patient, a young man in the prime of life, had become much exhausted from numerous and futile searches after the missile, from bedsores, profuse suppuration, an irritable diarrhœa, and pain so intense as to require the administration of an anæsthetic previous to dressing the wound, the choice lay between a lingering death or excision of the head of the femur, or the more fearful and precarious alternative of amputation at the joint. On August 14th the patient expressed willingness to submit to any operation that would afford relief, when he was anæsthetized for the purpose of again freely examining the parts, and performing such operation as should be considered necessary. Upon explorations of the wound with the probe and finger, the ball was discovered in the head of the femur, a T-shaped incision was made over the joint, the head of the bone was turned out of the acetabulum, and was sawn through the neck, just within the greater trochanter. The incisions were closed with metallic sutures, and the limb was temporarily placed between splints, with a pillow under the knee. A Smith's anterior splint not being on hand, nor the material procurable for making one, a long external splint, made in two parts, and connected by iron braces, was devised and put in course of construction. The after treatment consisted in carbolized dressings to the wound, the administration of antiperiodics to control a fever of a remittent type (at one time supposed to be the precursor of erysipelas or pyæmia), and a plain nutritious diet. Notwithstanding frequent displacement of the limb from occasional attacks of diarrhœa, and the absence of a proper apparatus to secure immobility, the performance of this formidable operation seemed to have imparted a new tenure of life. By November 20th the patient was able to walk about the hospital, and the further progress of the case was as rapid as it was favorable. On May 16, 1869, this soldier was discharged the service and pensioned for total and permanent disability, the injured member being shortened one inch and three-quarters. He came across the plains by the next train, and, in September, 1869, reported at the Surgeon General's Office, where a photograph was taken. At that time the patient's general health was excellent; the cicatrix was perfectly firm and sound, and the strength of the ligamentous attachments and the amount of control over the movements of the limb were very remarkable. He could bear much weight on the limb. He was supplied with a prothetic apparatus and advised not to use it straightway, but to continue exercising the limb continuously for some months, thereby increasing the strength of the muscles and ligamentous attachments, and the freedom of the newly-formed joint. The next week Read went to New York, where the proposed apparatus was ingeniously applied by Dr. E. D. HUDSON. In the summer of 1870, it was reported that this man could walk very comfortably with a cane either with or without apparatus. The appearance of the patient is shown in the accompanying wood-cut (FIG. 83.) In June 1871, three years after the operation, the man was in very good health, and could walk almost as well as ever." He was last paid on September 4, 1877. The next secondary operation was performed by Surgeon W. E. TAYLOR, U. S. Navy. A report of the case was published in *Circular* No. 3, S. G. O., 1871, p. 232: Charles B. Scott, a seaman of the U. S. Navy, aged 34, of fair general health, was wounded in an attack on a piratical vessel in Tecapan River, west coast of Mexico, June 17, 1870, by a rifle ball, fired at a distance of about eighty yards. He was conveyed a distance of seventy miles to the U. S. ship Mohican, on board of which he was treated for several days, and finally transferred on July 12th to the Naval Hospital, Mare Island, California. The wound of entrance was small, and situated a little below and about two inches posterior to the top of the left great trochanter. He rested entirely on the right side, with the injured limb partially flexed and resting on the sound one, the whole limb being inverted and shortened about one inch. Cold-water dressings had been applied to the wound and anodynes administered when required. His general condition was decidedly below par. The least movement in the injured joint caused severe pain; he did not sleep well, and his appetite was poor. Full diet, with milk and an anodyne at night, were ordered. On July 14th an examination of the wound was made. No anæsthetic was used, and the result was unsatisfactory. However, appearances led to the belief that the neck and probably the head of the femur were fractured; the ball could not be felt. The joint was not swollen but was very sensitive, and there was a scanty sanious and fetid discharge from the wound. On July 25th the patient was chloroformed, and Surgeon W. E. TAYLOR, U. S. Navy, made a single straight incision, seven or eight inches long, and found the neck and head extensively comminuted; he then sawed off the bone just below the trochanter minor, and removed the fragments, some twelve or fourteen in number, as also the ball, which seemed to have struck the neck obliquely, breaking it into three pieces, and then passed into the head, shattering it into nearly a dozen pieces. Very little blood was lost, two small arteries only requiring to be secured. After syringing the wound with a weak solution of permanganate of potash, it was partially approximated by four sutures, and the limb was placed in an ordinary fracture box, and dressed with oakum. The operation was well borne, and reaction prompt. Stimulants, with nutritious diet, were ordered, and rigid cleanliness was enforced. On the 27th the patient began to suffer from decubitus. On the evening of the 29th he became delirious; pulse 130

FIG. 81.—Shattered upper extremity of right femur, excised for caries following shot fracture. *Spec.* 5489.

mediary, with fifty-eight deaths, or 96.6 per cent.; forty-one, with twenty-six deaths, or 63.4 per cent., were secondary; and, in twenty-seven instances, with twenty-four deaths,

and irritable. Hydrate of chloral being substituted for morphia, he went to sleep in a few minutes, and next morning awoke refreshed and feeling better than at any time since the accident. The pulse fell to 100. On the 31st, the sutures were removed. The good effect of the chloral was very marked, but, by August 6th, it seemed to have lost some of its effect; whereupon morphia was combined with the usual dose, and he slept well. The discharge from the wound was small in quantity and laudable. On August 8th, some extension of the limb was made, but was badly borne. By the 14th, the patient was doing well in every respect. On the 21st, all dressings being removed from the limb, it was thoroughly bated and rubbed, after which it was replaced in the fracture box, when extension and counter-extension were made by means of the ordinary perineal band and screw. This was discontinued on the 26th, owing to enlargement of the inguinal glands and the general *malaise* and discomfort experienced by the patient. On the 30th, the use of anodynes was discontinued, as he could sleep without them. September 1st, found the patient improving, the discharge from the wound being moderate, with an entire absence of inguinal trouble, bedsores, and excoriations. Slight passive motion was commenced in the limb, and it was allowed to rest lightly on a pillow for several hours. On the 7th, he was able, for the first time, with assistance, to leave his bed. After this he continued to sit up several hours daily, and, gaining in flesh, was able, by the 18th, to walk on crutches. He continued to take daily a moderate amount of out-door exercise, the limb meanwhile being supported and steadied by means of a wire splint, and his general condition became excellent. On December 27th, he went by steamer to San Francisco, a distance of fifty miles, and returned in the evening, having borne the journey well. On January 20, 1871, a prothetic apparatus was adjusted to the limb, which, at the beginning, proved highly useful. On February 1st, the patient was transferred to the new Naval Hospital. At this time his general health was excellent. The left buttock was somewhat flattened, and there was a small opening about the centre of the line of incision, which discharged a small quantity of pus; the limb was about three and a half inches shorter than its fellow, the knee being quite stiff and foot everted (FIG. 86). The patient had gained about thirty pounds since the operation of excision, and there was a probability of his being able to walk quite well without the aid of crutches. Scott was discharged April 18, 1871, at Mare Island, California, and pensioned. Drs. R. V. WALSH and J. S. GUNNING, of Enniskillen, Ireland, certified, September 4, 1875: "There is a fistulary opening connected with the bone. The leg is greatly wasted, being one-third the size of the sound leg." Dr. JOHN ST. CLAIR GUNNING certified, October, 17, 1877: "Charles B. Scott, who died at Omagh, Tyrone County, Ireland, on the 1st day of July, 1877, was under my professional care, and his death was caused by chronic cystitis, the result of a very extensive and severe injury to his hip joint." The specimen 5884 is preserved in the Museum and shown in the accompanying wood-cut (FIG. 85). The third of the secondary operations of excision at the hip joint for shot injury was practised at Fort Fetterman, Wyoming Territory, in September, 1877, by Assistant Surgeon JOHN V. R. HOFF, U. S. A., who has furnished a detailed report of the case, from which a condensed abstract is made: Sergeant William J. Linn, Co. M, 4th Cavalry, aged 22 years, was wounded in a fight with Cheyenne Indians during the Powder River Expedition, November 25, 1876. The bullet (probably conoidal, calibre .50 inch, weighing 412 grains) entered the right groin three inches below and slightly internal to the anterior superior spinous process of ilium and two and three-fourth inches external to the symphysis pubis, passed obliquely backward through the hip joint, fractured the neck of the femur, notched the posterior segment of the rim of the acetabulum, and emerged at a point about one inch posterior and exterior to the notch in the acetabulum. The wound was received while the soldier was resting on his right knee and left foot in the act of discharging his carbine. The patient was immediately carried to the rear and a plaster of Paris badge applied. He was moved on a *travois* over an almost impassable country, during weather so cold that mercury froze, and reached Supply Camp on the third day. Here the plaster bandage was reapplied and the patient was placed in an ambulance and carried to Cantonment Reno, reaching the latter place after a five days' journey over a country where roads are unknown, in weather of the utmost severity, and under circumstances of hardship which skillful care and unremitting attention could but little alleviate. A week after his arrival at Reno, the plaster bandage was removed, the limb was elevated, and the wounds of entrance and exit, which were discharging pus freely, were treated with simple dressings. The wound of entrance closed in four weeks, and, though the wound of exit was still discharging, an immense abscess formed in and about the joint, which pointed in anterior cicatrix, finally opened spontaneously, and remained so for several months. A light extending weight was used for a short time, no medicine given except morphia occasionally for pain and physic for constipation. On March 24, 1877, the patient was transferred to the post hospital at Fort Fetterman. The journey was accomplished in five days on a stretcher slung in an army wagon. When admitted he was very emaciated, pale and pain-worn, and weighed about 100 pounds, having lost 80 pounds since the reception of the injury. Two suppurating sinuses led into the articulation and there was fibrous anchylosis of both hip and knee joints. The patient had not moved from a recumbent position since he received the injury, and could not even be raised upon a bed-pan without great pain. Tonics and a generous diet were ordered, the wounds were dressed with carbolic acid solution. The bowels were freely opened and kept regular. When the patient had fairly recovered from the exhausting effects of the journey a side splint was applied which enabled him to be moved without pain. Notwithstanding the most careful attention the patient gradually failed, and grew so feeble and complained so much of pain that it seemed but a question of weeks between an operation or death. On September 28th, Assistant Surgeon J. V. R. HOFF, U. S. A., excised the hip joint after SEDILLOT'S method. A circular incision was made to include the great trochanter and opening into the joint, the capsular ligament was severed, the head of the femur was thrown out and removed by the chain saw at a point just below great trochanter. The head of the femur (proper), which had been severed by the bullet at its neck, was found lying loosely in the acetabulum partially absorbed, and was easily removed by forceps. Ether was used; insensibility induced in seventeen minutes and maintained one hour and ten minutes; reaction was rapid and satisfactory. Antiseptic dressings were used. A double splint to fit both legs, made of light iron, reaching to the waist and there secured by a belt, was applied. This proved most useful in enabling the patient to be moved with comparative ease, and, at the same time, keeping the wounded parts measurably immovable. Extension was applied by means of tin plates

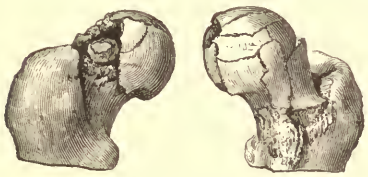

FIG. 85.—Anterior and posterior views of the upper extremity of the left femur. *Spec.* 5884.

or 88.8 per cent., the period of the operation was not stated. Grouping the one hundred and seventy-one cases of excision at the hip, according to the time or the occasions on which the injuries were received, we find that of sixteen operations performed before the American war, 1860–65, one proved successful, and that in a second the patient survived after consecutive amputation; that four fatal operations were performed during the insurrection in Poland, 1863, and the campaign in Schleswig-Holstein, 1864; that six excisions at the hip with two successes were performed during the Austro-Prussian War of 1866; that of seventy-one operations done in the Franco-Prussian War of 1870–71, eight were successful; that once, at least, excision at the hip was unsuccessfully performed during the Russo-Turkish War, 1876–77, and that in one instance the hip joint was successfully excised for shot injury in 1876, in California; that of the sixty-six cases of excisions at the hip performed for shot injury received during the American civil war, six proved successful; and that finally, of the six cases performed in the service of the United States since the close of the American war in 1865 to the present time (1879), four were attended with success. Of the six survivors of excision at the hip performed on patients wounded during the American civil war, two only were living in the early part of 1879: Brown, of Grand Rapids, Michigan (CASE 261, *ante*), and Pease, of Indianapolis, Indiana, (CASE 263, *ante*); both were examples of recovery from secondary excision. Brown can bear his weight upon the injured limb, can walk across a room without the aid of crutches or cane, but ordinarily uses a support. Pease, with the assistance of a "six-inch lift," can walk quite well with a cane. Tilliston, the third survivor of secondary excision, lived until September 6, 1871, ten years after the operation. He was unable to bear any weight on his limb, and was obliged to wear crutches. He succumbed to most extensive necrosis of the pelvic bones and femur, with huge recurring abscesses. In the case of *Cannon*, the survivor of primary excision (CASE 206, *ante*), the limb was useless for purposes of locomotion. He died of diphtheria in 1865, eighteen months after the injury and operation. Of the two survivors of intermediary excision, Lieutenant *J. M. Jarrett* (CASE 239, *ante*) went to his home in North Carolina, and was reported as doing well in September, 1864, ten months after the operation; walking about with a high-heeled boot and the aid of a cane. Persevering attempts to obtain further information regarding the ulterior history of

three inches wide by twelve inches long, secured to the leg by adhesive straps and connected through eyes, at their extremities, by elastic tubing, to a twenty-one pound weight, playing over a pulley. The tubing passed through a piece of board twelve inches long, secured below the foot piece, thereby preventing pressure on the malleoli. This arrangement answered the purposes of extension admirably, while counter-extension was effected by elevating the foot of the bed. The patient's convalescence was very tedious. He suffered from bed-sores and almost continuous pain, requiring the constant administration of opiates and anodynes; but gradually improved, and, on December 9th, Dr. HOFF notes: "From this date there was scarcely an untoward symptom. Convalescence progressed slowly but surely; stiffness of the muscles disappeared entirely about the 15th instant. Tympanitis lasted three days. Spasm persisted, but with greatly reduced violence, nearly two weeks after the extension-weight was removed, December 27th. The patient had daily exercise, and, on January 10, 1878, took his first walk in the open air. The discharge grew less in amount, and, on January 15th, the dressings were entirely removed. February 17th, the partial anchylosis of the right knee joint not having been fully overcome by passive motion and mechanical appliance, ether was administered and the adhesions thoroughly broken up. There was partial bony anchylosis, the patella at portion of superior external border was firmly joined to femur, and in the breaking down suffered fracture. The limb was placed in a straight splint, and on the third day passive motion was instituted. March 18, 1878, the patient was ordered to join his regiment. The false joint at the hip had all the motions of its predecessor in a somewhat limited degree, and, though capable of sustaining the patient's weight while walking, was not yet equal to any great exertion, but daily gained in strength. In other respects the patient's health was in admirable condition. Apparent shortening of the limb one inch. The resected upper extremity of the femur was contributed to the Army Medical Museum by the operator, and is numbered 6787 of the Surgical Section. It is shown in the wood-cuts (FIGS. 88*a*, 88*b*). In a letter to Dr. HOFF, dated Fort Clark, Texas, April 30, 1878, Sergeant Linn writes: "Dear Sir: I write to you according to promise to let you know how I am getting along. I am feeling just as well as ever I did. My leg is improving in size and strength, but the hip joint is just about the same as when I left you. I weigh one hundred and fifty pounds now and am still improving." On July 10, 1878, Surgeon JOHN MOORE, U. S. A., Medical Director Department of Texas, forwarded to the Surgeon General two photographs showing the appearance of the limb ten months after the operation. They are copied in the wood-cuts (FIGS. 87, 88) on the preceding page. In a letter from Fort Clark, Texas, October, 1878, Linn states that he "don't use a crutch at all, and only uses a cane when he goes to walk a long distance."

FIG. 88*b*.—Posterior view of the same.

this officer were unavailing. The second survivor of the intermediary operation, Hugh Wright (CASE 240, *ante*), excised May 27, 1864, walked well without crutch or cane, bearing his full weight on the mutilated limb. He lived until October 26, 1874; his death was ascribed to cardiac trouble.

Of the six patients submitted to excision at the hip in the United States Army and Navy since 1865, four recovered. Assistant Surgeon F. Meacham's primary case of Erne, 4th Infantry, aged 48 (Note 1, p. 120, *ante*), operated on December 3, 1869, lived until November, 1871. The patient walked comfortably on crutches and had slight control of his limb. Recovering thoroughly from the coxo-femoral lesions, he became a great sufferer from chronic diarrhœa, and, at last, was attacked with acute mania. The other three cases were examples of successful secondary excision. In the case of Charles F. Read, 37th Infantry (Note to p. 122, *ante*), wounded June 6, 1868, and successfully excised by Assistant Surgeon J. R. Gibson, August 14, 1868, the result was exceptionally gratifying. In a letter from his home at Thornton's Ferry, New Hampshire, dated July 1, 1878, nearly ten years after the operation, Read was able to write that he thought he had a very good leg under the circumstances, and used no artificial appliance. His crutches he had laid aside since 1871, relying altogether on his cane, with which he "could get along very handily." He adds a minute account of the condition of the injured limb, showing indisputably an extraordinary restoration of the functions of the articulation. "I can use it so well," says Read, "that some think me falsifying when I tell them that the head of the bone is lost." In the secondary case of the seaman, Charles B. Scott, wounded June 17, 1870, on whom Surgeon W. E. Taylor, U. S. N., successfully excised the head of the femur, July 25, 1870, there was temporary relief. The patient regained comparative health and flesh, and partial use of the limb, exchanging his crutches for a cane; but necrosis invaded the articulation, and the patient succumbed July 1, 1877, while on a visit to his friends in Tyrone County, Ireland. In the case of Sergeant W. J. Linn, 4th Cavalry, wounded November 25, 1876, who underwent excision at the right hip by Assistant Surgeon J. V. R. Hoff, U. S. A., September 28, 1877; a year after the operation the patient's health was in admirable condition, and there was every prospect that the mutilated limb would regain as great a measure of utility as can be hoped for, under such circumstances. In October, 1878, he had discarded the crutch, and only used a cane when he walked long distances.

Of the sixty-six excisions at the hip performed during the American civil war, forty-five were practised on Union and twenty-one on Confederate soldiers. Of the forty-five Union soldiers, four recovered, a mortality rate of 91.1 per cent.; of the twenty-one Confederates, two recovered, a fatality of 90.5 per cent.

The side on which the excision was practised was recorded in sixty-one of the sixty-six cases, twenty-six being on the right and thirty-five on the left side. Three of the former, or 88.4 per cent., and also three of the latter, or 91.4 per cent., proved fatal.

Six operations, viz: one primary, four intermediary, and one secondary, performed on patients under the age of 20 years, terminated fatally; twenty excisions, viz: nine primary, six intermediary, and five secondary, on patients, between 20 and 29 years, inclusive, presented three recoveries, one after a primary, and two after intermediary operations; of thirteen operations on men between 30 and 39, six were primary, four intermediary, and three, with two recoveries, were secondary; four excisions were performed on patients over 40 years, two being fatal intermediary, and two, with one recovery,

secondary operations. In twenty-three of the sixty-six excisions the ages of the patients were not ascertained.

According to the statistical arrangement of the cases of excision at the hip for shot wounds in the American civil war, as given in TABLE X, p. 89, *ante*, the mortality of the primary operations was 96.9 per cent., that of the intermediary 90.9 per cent., while the fatality of the secondary operations was only 72.7 per cent. The results of the six excisions at the hip in the American Army and Navy since the civil war gave a mortality of 50.0 per cent. for the primary operations, of 100.0 per cent. for the intermediary, while the three secondary operations were all successful. Of the ninety-nine other cases of excision at the hip after shot injury, cited in Note 1, page 90, *ante*, of primary cases, 87.5 per cent. proved fatal; of the intermediary all perished, while, of the secondary, only 66.6 per cent. had a fatal termination. Aggregating all cases of excision at the hip for shot injury in which the results have been ascertained, we have a mortality rate of 93.0 per cent. for the primary, of 96.6 per cent. for the intermediary, and of 63.4 per cent. for the secondary operations. This result confirms what we have already stated on page 610 of the *Second Surgical Volume*, that the "excisions and amputations practised during the intermediary or inflammatory stage are by far the most dangerous, and should never be performed except as compulsory operations." The ratio of mortality in the secondary or ulterior operations is considerably less than that in the primary operations. But this fact should not lead to the conclusion that the primary operation is to be avoided. The disastrous results attending cases of indubitable shot fracture at the hip treated by temporization, as pointed out on page 88, *ante*, must induce the surgeon to desist from such an experiment, and to excise primarily rather[1] than submit the patient to the danger of the inflammatory period.[2]

In nine[3] of the sixty-six cases of excision of the head of the femur performed for shot injuries received during the American civil war, the acetabulum was involved, and, although these nine cases terminated fatally, the successful operations of Assistant Surgeon J. V. R. Hoff, U. S. A., in the case of Linn (Note on page 123, *ante*), and of Drs. Schön-

[1] Dr. JOHN ASHHURST, jr. (*Princ. and Pract. of Surgery*, 1871, p. 165), declares that: "Gunshot injuries of the hip joint are universally regarded as among the gravest injuries met with in military practice," and, after reviewing the statistical and other evidence on the comparative advantages of expectant treatment, excision, and amputation, asserts that: "From these facts the conclusion is fairly drawn, that in any case of gunshot injury of the hip joint, primary excision should be preferred to any other mode of treatment, and this simply to increase the chance of life, without reference to the utility of the preserved limb. Of course there may be such extensive destruction of parts as to put excision out of the question, and in such cases the surgeon must still have recourse to what HENNEN calls the 'tremendous alternative' of hip joint amputation, an operation which may also be required secondarily, after an unsuccessful attempt to save the limb." Dr. WILLIAM THOMSON, formerly Brevet Major and Assistant Surgeon, U. S. A., who, as Acting Medical Inspector of the Army of the Potomac and Surgeon-in-charge of Douglas Hospital, Washington, had excellent opportunities to investigate the subject of shot fractures at the hip joint, wrote to the compiler in 1868: * * "From a study of these cases, and others similar in character, it would appear that the fatal terminations, under expectant treatment, are due to the following causes: the joint becomes inflamed primarily or secondarily; the capsule becomes distended by the products of inflammation, gives way, and the contents escape into the neighboring parts, and give rise to those extensive dissecting abscesses which are found at the autopsies, and which account so entirely for the fatal results. If these views should be accepted, a full and free incision into the joint, at an early period, would be the proper surgical procedure, and this is accomplished by its excision. The removal of the head of the bone severs, to that extent, the connection between the body and the lower extremity, prevents that constant disturbance at the joint that follows every motion of the body, and thus places the seat of injury at comparative rest. The division of the bone through its cancellated structure may increase the risk of osteomyelitis with its purulent infection, and experience may yet demonstrate that a full and free incision alone, in the primary stage, may be the best resource of surgery."—(*Circular* No. 2, S. G. O., 1869, p. 114.)

[2] LOSSEN (I.) (*Kriegschir. Erf. aus Mannheim, Heidelberg und Carlsruhe*, in *Deutsche Zeitschr. für Chir.*, 1873, B. II, p. 64) cites a fatal case of shot fracture of the neck of the femur and great trochanter, and remarks: "A primary resection of the joint, with removal or gouging of the trochanter major, might in this case have offered a chance for recovery. But it was probably difficult to ascertain immediately after the injury how far the joint was involved. A secondary excision, from the general appearances *(post-mortem)* cited, gave very little prospect of success." FISCHER (II.) (*Kriegschirurgische Erfuhrungen*, Erlangen, 1872, p. 201) remarks of shot fractures of the hip joint: "All well-timed operative interference miscarries on account of the difficulty of the diagnosis. . . I lament this difficulty and impossibility of exact diagnosis, because I believe that the best mode of treatment of shot fractures of the hip joint is the primary resection of the joint, however difficult the execution of the operation might be."

[3] CASE 209, p. 93, Private *Charles Beard*, 12th Miss.; CASE 224, p. 95, Sergeant S. Grimshaw; CASE 235, p. 98, Captain T. R. Robeson; CASE 236, p. 98, Unknown private of the First Army Corps; CASE 237, p. 99, Unknown; CASE 247, p. 105, Private C. E. Marston, 1st Massachusetts; CASE 257, p. 109, Corporal H. C. Sennett, 122d New York; CASE 259, p. 110, Lieutenant *D. N. Patterson*, 46th Virginia; CASE 269, p. 118, Private *A. Toney*, 16th North Carolina.

born[1] and Hupeden,[2] prove conclusively that an injury of the margin of the acetabulum does not preclude the operation of excision at the hip.

When we consider the evidence adduced in the foregoing pages, and especially the fact that of one hundred and seventy-one patients on whom excision at the hip for shot injury is known to have been performed to the present date, twenty-three survived the operation, although in one instance the excision was followed by amputation at the hip (Neudörfer's case of Schranz, Note 1, on page 90, *ante*), and that the remaining twenty-two survivors had more or less use of the injured limbs, it must be admitted that the results of this operation, so far, have been encouraging, in an almost hopeless class of cases.

AMPUTATIONS AT THE HIP JOINT.—In 1867, in a monograph on amputations at the hip joint,[3] it was stated that "fifty-three authenticated instances of amputations at the hip joint, performed on account of injuries inflicted by weapons or of lesions consecutive thereto," had occurred during the American civil war. Since that time, data of thirteen additional cases of this operation have been obtained, making, at the present time, a total of sixty-six cases of coxo-femoral amputations to be considered here:

TABLE XIV.

Numerical Statement of Sixty-Six Cases of Amputation at the Hip Joint.

AMPUTATIONS.	TOTAL CASES.	RECOVERIES.	DEATHS.	RATIO OF MORTALITY.
Primary	25	3	22	88.0
Intermediary	23		23	100.0
Secondary	9	2	7	77.7
Reamputations	9	6	3	33.3
Aggregate	66	11	55	83.3

I have continued to divide these sixty-six operations into primary, intermediary, secondary, and reamputations, according to the plan adopted in the monograph of 1867, and the relative percentage of fatality of the secondary operations and of reamputations confirm me in the opinion expressed at that time, that the reamputations "should be separated into a distinct class, because they are quite numerous and widely differ in the risk attendant upon them from other secondary operations." Of nine cases of reamputations at the hip three only, or 33.3 per cent., were fatal; of nine secondary operations six, or 77.7 per cent., terminated in death. The subjects of the twenty-three intermediary exarticulations at the hip all perished, and of twenty-five primary amputations probably three were successful.

As indicated in TABLE IX, page 65, *ante*, in twenty-seven of the sixty-six exarticulations the injury directly involved the hip joint. In thirty-two instances, the operations followed shot fractures which did not extend beyond the diaphysis of the femur. In two of this series and in seven examples in which the primary lesion implicated the knee joint, amputations in the continuity of the thigh had preceded the exarticulations at the hip.

In the subjoined foot-note[1] an endeavor is made to compile a correct record, in chronological order, of the published authentic examples of amputation at the hip joint in military

[1] LARREY (D. J.) (*Mém. de Chir. mil. et Camp.*, Paris, 1812, T. II, p. 180), A soldier of the French army of the Rhine, in 1793. Primary operation; died within a week.—2. WENDELSTADT (*Reminiscenzen*, in HUFELAND'S *Neues Journal der Practischen Arzneykunde*, Berlin, 1811, B. XXVI, Stück II, p. 110) relates: "I have seen and examined an Englishman, who served as a sailor in the British Navy, and who had lost at the bloody battle of Aboukir, August 1, 1798, the thigh from a cannon ball, and who had undergone the amputation of the probably splintered stump out of the acetabulum, and who *survived the operation many years.*"—3. LARREY (D. J.) (*Rel. chir. de l'Armée d'Orient*, Paris, 1803, p. 329), Bonhomme, officer of the 18th Demi-Brigade, Army of Egypt, 1799. Primary exarticulation at right hip; died of the plague on the eighth day.—4. LARREY (D. J.) (*Rel. chir. de l'Armée d'Orient*, 1803, p. 332), Drummer of 2d Light Demi-Brigade, Army of Egypt, in 1799, aged 20. Primary amputation at right hip; died in a few days.—5. LARREY (D. J.) (*Mém. de Chir., etc.*, 1812, T. III, p. 350), A French soldier at Wagram, July 6, 1809. Primary operation; died in three hours.—6. LARREY (D. J.) (*Mém. de Chir., etc.*, T. III, p. 351), A French soldier at Wagram, July 6, 1809. Primary operation; died within twenty-four hours.—7. BROWNRIGG (GUTHRIE'S *Commentaries*, 6th ed., 1855, p. 62), A soldier at Elvas, 1811. Secondary operation; died in eight days.—8. LARREY (D. J.) (*Mém. de Chir., etc.*, 1817, T. IV, p. 26), A Russian soldier, in 1812. Primary amputation at left hip; died on the twenty-ninth day from dysentery.—9. LARREY (D. J.) (*Mém. de Chir., etc.*, 1817, T. IV, p. 50), Lieutenant of Dragoons, Borodino, September 7, 1812. Primary; alive and well at Orcha three months after.—10. BROWNRIGG (AVERILL (C.) (*A Short Treatise on Operative Surgery*, London, 1825, p. 217), Private 13th British Light Dragoons, December 29, 1811. Secondary operation December 12, 1812; recovery.—11. BROWNRIGG (AVERILL, *loc. cit.*), Particulars not recorded: fatal.—12. GUTHRIE (G. J.) (*Treatise on Gunshot Wounds*, 1827, p. 332), Private Mason, 23d British Infantry, in 1812. Secondary re-amputation; death in seven hours.—13. COOPER (SAMUEL) (*Dict. Pract. Surg.*, 8th London ed., 1861, Vol. I, p. 116), A British soldier at Oudenbosch, in Holland, in 1814. Intermediary operation; died in a few minutes.—14. COLE (G. J. GUTHRIE, *loc. cit.*, p. 351), A soldier at Bergen-op-Zoom, 1814. Secondary operation; died in twenty hours.—15. EMERY (GUTHRIE, *loc. cit.*, p. 334), Sebastian de l'Amour, Corp. Chass. Britt., Spain, August, 1813. Secondary operation July 21, 1814; death in thirty days.—16. GUTHRIE (G. J.) (*A Treatise on Gunshot Wounds*, London, 1827, p. 342), Duguet, 45th French Regiment, aged 25, Waterloo, June 18, 1815. Intermediary operation July 7th; recovered. Duguet died in 1840 (GUYON, *Stat. des amputations pratiquées à l'Armée d'Afrique*, etc., *pendant les années* 1837, 1838, *et* 1839, in *Gaz. Méd. de Paris*, 1841, T. IX, p. 106).—17. Mr. BLICKE (J. THOMSON, *Obs. after the Battle of Waterloo*, Edinb., 1816, p. 270), A British soldier, Waterloo, 1815. Secondary operation; died in eight days.—18. B. BRODIE (G. J. GUTHRIE, *On Gunshot Wounds of the Extremities*, London, 1815, p. 116) operated, in 1814, unsuccessfully in a case of accidental shot wound.—19. QUARRIER (D.) (*Med. Chir. Trans.*, 1820, Vol. VIII, p. 3), Seaman T. Sullivan, Algiers, 1816. Primary operation; death in fifteen minutes.—20. KRIMER (*Exarticulation des Oberschenkels aus dem Hüftgelenke*, in *Journal der Chirurgie*, von C. F. von GRAEFE und Ph. v. WALTHER, Berlin, 1828, B. XII, p. 121), J. S. C——, aged 38, Waterloo, 1815. Exarticulated in 1822; died on the tenth day.—21. Dr. SPER (ROUX (J.), *Désarticulation de la cuisse d'après des observations rec. a Saint Mandrier*, Paris, 1860, p. 4), A galley prisoner at Toulon, in 1825; fatal.—22. DIEFFENBACH (J. F.) (*Mag. für die gesammte Heilkunde*, B. XXIV, H, S. 335), A Baron, aged 22. Secondary operation in 1826; died in ten hours.—23. Dr. BRYCE (*Glasgow Med. Jour.*, 1831, p. 262), Soldier, aged 23, at the siege of Athens, May, 1827. Recovery in six weeks.—24. ROUX (P. J.) (*Gaz. des Hôp.*, 1830, p. 392), A Swiss subaltern, in 1830. Primary operation; died the same day.—25. CLOT BEY (*Gaz. des Hôp.*, 1830, T. IV, p. 96), Ali Homer, an Arab, aged 26. Secondary operation in 1830; died November 17, 1830.—26. SÉDILLOT (C.) (*Ann. de la Chir. Franç. et Et.*, 1841, T. II, p. 279), A Russian prisoner; Poland, 1831. Primary; died soon after the operation.—27. The elder DEMME (VERDAT, *Thèse inaug.*, Berne, 1846, and A. LÜNING, *Über die Blutung bei der Exarticulation des Oberschenkels*, Zürich, 1877, p. 69), Polish solder, in 1831. Intermediary operation; death in thirteen days.—28. Surgeon ARNOLD (A. LÜNING, *loc. cit.*, p. 69, and VERDAT, *Thèse inaug.*, Berne, 1846), Russian soldier in Polish War, 1831. Ligation of common iliac by Dr. DEMME. Intermediary exarticulation at hip; death on the third day.—29. Dr. FRANCKE (A. LÜNING, *loc. cit.*, p. 69, and FRANCKE, *Diss.*, Leipzig, 1835), Russian soldier, A. Pasgezuk, aged 22, Warsaw, Sept. 7, 1831. Operation Sept. 22, 1831; death in two days.—30. The elder DEMME (A. LÜNING, *loc. cit.*, p. 68, and VERDAT, *Thèse inaug.*, Berne, 1846), Polish soldier, in 1831. Intermediary operation; death from gangrene on fifth day.—31. LETULLE (H. LARREY, *Hist. chir. du siége de la Cit. d'Anvers*, 1803, p. 307), A French cannonier of the 11th regiment of Artillery. Siege of Antwerp, 1832. Primary operation December 13th; died December 22, 1832.—32, 33. During the campaign in Syria, in 1832, two exarticulations at the hip were performed, one by VON WELZ, the other by CHERUBINI. Both were fatal (M. JÆGER in Dr. W. WALTHER'S *Handwörterbuch der Gesammten Chirurgie*, Leipzig, 1836, B. I, p. 409).—34, 35. ALCOCK (R.) (*Notes on the Med. Hist. and Stat. of the British Legion in Spain*, London, 1838, p. 78) relates that he was informed by Dr. BELMONT that an accomplished Spanish surgeon had twice amputated at the hip joint during the Peninsular War of 1835—once with success.—36. HUTIN (F.) (*Rec. de Mém. de Méd. de Chir., etc.*, 1re série, T. XLIV, p. 219), M——, a soldier of the 1st Light Battalion, Constantine, 1836. Primary amputation; Manec's method; died December 13, 1836.—37. HUTIN (F.) (*Rec. de Mém. de Méd. de Chir., etc.*, T. XLIV, p. 220), L——, 2d Regiment of Engineers, Constantine, 1836. Primary operation; died December 4, 1836.—38. BAUDENS (L.) (*Clin. des plaies d'armes à feu*, Paris, 1836, p. 517), C——, a soldier in the Battalion d'Afrique, 24 years old, Algiers, 1836. Intermediary operation; recovered, and was an inmate of the *Hotel des Invalides* in 1840 (SÉDILLOT, *Amp. coxo-fémorale*, in *Rec. de Mém. de Méd.*, 1840, T. 49, p. 276).—39–41. From the tabular statement of Dr. GUYON (*Statistique des amputations pratiquées à l'armée d'Afrique*, etc., *pendant les années*, 1837, 1838, *et* 1839, in *Gaz. Méd.*, 1841, T. IX, p. 105) it appears that no exarticulations at the hip were performed during these years; but Dr. GUYON states (*loc. cit.*, p. 106) that three unsuccessful amputations at the hip were performed in 1841.—42. BAUDENS (L.) (*Rec. de Mém. de Méd. de Chir.*, etc., 1853, 2me sér., T. X, p. 130), X——, a soldier of the 18th Light Infantry, Paris, 1848. Primary operation; death on the second day.—43. VIDAL (AUG.) (*Traité de Path. ext. et de Méd. op.*, 5me éd., Paris, 1861, T. V, p. 731), A French student of medicine, insurrection in Paris in 1848. Secondary exarticulation; fatal.—44–46. During the same revolution RICHET (M. E. HERVIEUX, *Compte rendu des blessés reçus à l'ambulance des Tuileries*, in *Gaz. Méd. de Paris*, 1848, p. 712) performed a primary operation which proved fatal; and P. GUERSANT and ROBERT (L. LEGOUEST, *Traité de Chir. d'Armée*, 1863, p. 700) had each an unsuccessful intermediary operation.—47. RESTELLI (F. BAROFFIO, *Delle Ferite d'arma da fuoco*, Torino, 1862, p. 284) performed a successful exarticulation in 1848, after the insurrection in Lombardy.—48. TREZZI (GRITTI ROCCO, *Delle Fratture del Femore par arma da fuoco*, Milano, 1866, p. 80) operated unsuccessfully on an insurgent at Milan in March, 1848.—49. C. TEXTOR (G. B. GUENTHER, *Die Blutigen Operationen*, Leipzig, 1859, Abschmitt VIII, p. 180), Exarticulation for shot fracture of the neck of the femur in a patient aged 32, in 1848; death from pyæmia.—50. TEXTOR, the younger (GÜNTHER, *loc. cit.*, p. 180), performed an intermediary operation in 1848; death on the fourth day.—51. ROUX (P. J.) (*Des plaies d'armes à feu, Communications faites, etc.*, par BAUDENS, ROUX, etc., Paris, 1849, p. 38, and *Gaz. des Hôp.*, 1848, p. 513) had, in June, 1848, a secondary fatal operation.—52. LINHART (W.) (A. LÜNING, *loc. cit.*, p. 75, and ESCHE, *Diss. inaug.*, Würzburg, 1863, p. 11), in 1848, in a case of shot comminution of the trochanter, ligated the femoral, and afterwards exarticulated at the hip. The patient died shortly after the operation.—53–59. During the Schleswig-Holstein War, 1848–50, seven exarticulations at the hip were made. Prof. B. von LANGENBECK (*Über die Schussfracturen der Gelenke*, Berlin, 1868, p. 19) performed four of the seven operations: J. Seibold, drummer in Tann's corps, aged 18, wounded at Hoptrup, June 7, 1848; operation June 8th; patient hale and hearty in 1856. Anders Nielson, 2d Danish Jaegers, aged 26, Schleswig, April 23, 1848; operation April 24th; death May 21st. Niels Andersen, 4th Danish Infantry, Schleswig, April 23, 1848; operation May 14th; death May 20, 1848. Danish soldier, wounded at Bau, April 9, 1848; operation June 20th; death June 21, 1848. The other three operations of this campaign proved fatal; no further data are noted (L. STROMEYER, *Maximem*, 1861, p. 532).—60. LENTE (F. D.) (*Transactions Am. Med. Association*, 1848, Vol. IV, p. 316), J. Dalzell, aged 23. Astor Place Riots, New York, 1849. Primary operation; died May 12, 1849.—61–63. In the War in the Punjaub, 1848–49, three primary operations were performed. Dr. MCRAE (*Indian Annals of Med. Sci.*, 1857, p. 663) states that the patients died—one in six, one in twelve, and one in thirty-six hours, from shock.—64. BECK (B.) (*Die Schusswunden*, Heidelberg, 1850, p. 315), Soldier of the 2d Baden Infantry, wounded June 29, 1849, in battle, at the Murg. Secondary operation: death six days after operation.—65. FAYRER (J.) (*Clinical Surgery in India*, London, 1866, p. 630), Moung Schwé-Mo, a Burman, aged 30. Rangoon, Bengal, February 15, 1853. Primary amputation at left hip February 16th; death March 17, 1853.—66. Dr. BEATSON (RANKING'S *Abstract*, 1855, No. 21, p. 182), Thomas Lisbey, aged 61. Conductor in the Ordnance Department, Donnabew, March 19, 1853. Exarticulation of left hip March 25th; died March 25, 1853.—67–110. Of the forty-four exarticulations at the hip performed during the

surgery apart from the sixty-six cases that pertain to the American civil war. This category comprises one hundred and eighty-four cases, of which the results are ascertained in

Crimean War, two were done in the Sardinian army, eight by Professor N. PIROGOFF (*Grundzüge der Allgemeinen Kriegsch.*, Leipzig, 1864, p. 1137), in the Russian army, fourteen in the British army (MATTHEW, *loc. cit.*, p. 374), and twenty in the French army (J. C. CHENU, *Rapport med. chir. de Camp. d'Orient*, 1865, p. 658). PORTA states that the two cases in the Piedmontese army were fatal. Of PIROGOFF'S eight cases two survived five days and the others perished within two or three days. The operations in the English army were all primary and resulted fatally. The results of the operations in the French army were equally unfortunate; all the patients died. Of twenty-two of the forty-four cases it is only recorded that they had a fatal termination. The particulars of the other twenty-two will here be cited: ALEXANDER (T.) (GUTHRIE'S *Comment.*, 6th ed., p. 620) disarticulated at the hip, in the case of Peter Cleary, 23d Fusileers, for gunshot fracture of femur, Alma, Sept. 20, 1854. Operation Sept. 21st; patient died on the passage to Scutari. ALEXANDER (T.) (G. J. GUTHRIE, *Commentaries*, 6th ed., 1855, p. 620), A Russian prisoner, Alma, Sept. 20, 1854. Primary operation Sept. 22d, died Oct. 22, 1854. ALEXANDER (T.) (G. J. GUTHRIE, *loc. cit.*, p. 620), Peter Sullivan, 33d British Infantry, Alma, Sept. 20, 1854. Primary operation Sept. 21st; died Oct. 11, 1854. MCKENZIE (R.) (MACLEOD, *Notes on Surgery in the Crimea*, London, 1858, p. 369), Soldier, Alma, Sept. 20, 1854. Primary operation; died. Assistant Surgeon WYATT (T. P. MATTHEW, *Med. and Surg. Hist. of the British Army in the Crimea*, London, 1858, Vol I. p. 111), An officer of the Coldstream Guards, Inkermann, Nov. 5, 1854. Primary operation; died immediately after the operation. MOUNIER (in CHENU'S *Rapp. méd. chir. sur. la Camp. d'Orient*, 1865, p. 660), Garassimoff, a Russian prisoner, Alma, Sept. 20, 1854. Intermediate operation Sept. 27th; died Sept. 29, 1854, two days after the operation. LEGOUEST (L.) (*Mém. de la Soc. de Chir.*, 1863, T. V, p. 157), Ignatius Wolokenski, 5th Russian Infantry, aged 30, Alma, Sept. 20, 1854. Intermediary amputation at left hip October 3d; died Feb. 9, 1855. MOUNIER (CHENU, *loc. cit.*, p. 660), Chifftzoff, a Russian prisoner, Inkermann, Nov. 5, 1854. Intermediary operation November 5th; died December 2, 1854, one week after the operation. PAULET (CHENU, *loc. cit.*, p. 661), Soldier. Primary operation in 1855; died one hour after the operation. LUSTREMAN (CHENU, *loc. cit.*, p. 661), Soldier. Primary operation in 1855; died five hours after the operation. THOMAS (CHENU, *loc. cit.*, p. 661), Soldier, gunshot fracture of the femur, 1855. Primary operation; died five hours after the operation. THOMAS (CHENU, *loc. cit.*, p. 661), Soldier, 1855. Primary operation; died eleven hours after operation. PERRIN (CHENU, *loc. cit.*, p. 660), A private of the 32d French Infantry. Fracture of left femur July 5, 1855. Primary operation a few hours after injury; died in one or two days. FRANKLYN (T. P. MATTHEW, *loc. cit.*, Vol. I, p. 377), A private of the 77th British Infantry, Sevastopol, August, 1855. Primary operation; died twenty-two hours after the operation, from exhaustion. DUNLOP (T. P. MATTHEW, *loc. cit.*, Vol. I, p. 403), A soldier of the 88th Regiment Connaught Rangers. Primary operation; died soon after the operation, in November, 1855. Surgeon-Major TROUSDELL (R. DRUITT, *Surgeon's Vade Mecum*, 1865, 9th ed., p. 160), A private of the 50th British Regiment, Sevastopol, 1855. Primary operation; died the day after the operation. MOUNIER (CHENU, *loc. cit.*, p. 660), Pietrow, a Russian prisoner, Inkermann, Nov. 5, 1855. Secondary operation Dec. 19th; died Dec. 29, 1854. LARIVIÈRE (CHENU, *loc. cit.*, p. 660), Kerigla, a Russian prisoner, Traktir Bridge, Aug. 16, 1855. Intermediary operation Aug. 23d; died August 23, 1865, during the operation. MAUGER (CHENU, *loc. cit.*, p. 661), A Russian prisoner, Traktir Bridge, Aug. 16, 1865. Intermediary operation; died soon after the operation. SALLERON (*Mém. de Méd., de Chir. et de Phar. Mil.*, 2me sér., T. XXI, p. 317), A soldier. Sevastopol, 1855. Intermediary operation (?); died twenty hours after the operation. SALLERON (*Mém. de Méd., de Chir. et de Phar. Mil.*, 2me sér., T. XXI, p. 317), A soldier, Sevastopol, 1855. Intermediary operation (?); died sixty hours after the operation. Chief Surgeon MARROIN, of the French Navy (J. ROUX, *Désarticulation de la cuisse*, Paris, 1860, p. 4), disarticulated, in the case of a soldier of the Crimean army, for fracture of the greater trochanter. The patient died shortly after the operation.—111–112. Professor J. F. HEYFELDER, chief surgeon of the Russian army in Finland, in 1855 (*Die Verwundungen und Operationen in Folge des Bombardements von Svéaborg vom* 9–11 *Aug.*, in *Deutsche Klinik*, 1855, B. 7, pp. 530–532) exarticulated twice at the hip. A Finnish soldier, wounded at Svéaborg, August, 1855; primary amputation at left hip; died in two hours. Stanislaus Maletzki, 8th Finnish Bat., shot fracture of neck of left femur, Svéaborg, Aug. 9–11, 1855; primary operation; patient died in less than an hour.—113–115. BERTHERAND (*Camp. de Kabylie*, Paris, 1862, pp. 145, 238, and 280) gives three examples of disarticulation at the hip: A——, 60th Line, wounded June 20, 1854; fracture of neck of femur, disarticulation, by Dr. GILGENCRANTZ, July 14, 1854; death on the same day, before recovering from the effects of the chloroform. C——, 90th Line, shot fracture of neck of femur, Algiers, May 24, 1857; secondary disarticulation; died on the day of the operation. W——, 2d *Légion étrangère*, shot fracture of neck of right femur; disarticulation by Dr. TABOURET; fatal.—116. BERTHERAND (A.) (*Camp. d'Italie, de* 1859, Paris, 1860, p. 37), An Austrian soldier, a prisoner after the battle of Palestro, June 4, 1859. Intermediary operation; died three hours after the operation.—117. ARLAUD (J. C. CHENU, *Camp. d'Italie en* 1859 *et* 1860, T. II, p. 697), Louis Legallo, Fusileer, 84th French Regiment, age 25, Montebello, May 20, 1859. Secondary exarticulation at right hip; recovered.—118. ISNARD (J. C. CHENU, *loc. cit.*, p. 694), Captain Deshayes, 73d Regiment, Solferino, June 24, 1859. Secondary exarticulation at left hip; recovery.—119. ROUX (JULES) (CHENU, *Camp. d'Italie, en* 1859 *et* 1860, T. II, p. 697), Lieutenant Joseph Vitarel, 65th French Infantry, aged 24, Magenta, June 4, 1859. Secondary amputation at left hip; recovered.—120. NEUDÖRFER (J.) (*Handbuch der Kriegschir.*, 1872, B. II, Abth. II, S. 1468), Johann Schranz, 7th Jaeger. Neck of femur. Palestro, May 30, 1859. November 27th, excision at left hip joint. December 1st, amputation at hip joint. NEUDÖRFER saw the patient in 1868.—121. NEUDÖRFER (J.) (*loc. cit.*, p. 1467), Jurko Katsch, of Inf. regiment E. H. Stephan, Solferino, June 24, 1859. Right trochanter. Operation, August 8th, seventy-six days after the injury; died August 25, 1859.—122. NEUDÖRFER (J.) (*loc. cit.*, p. 1468), Walland Waskaneder, Co. 13, of Baron Rossbach's Regiment, Solferino, June 24, 1859. Fracture of upper third of femur. Disarticulation Dec. 31st (one hundred and ninety days after injury); died four months later.—123. SCOTTI (G. B.) (GRITTI ROCCO, *Frat. del fem. per arma da fuoco*, Milano, 1866, p. 80), An Italian soldier. Gunshot fracture of femur, Solferino, June 24, 1859. Intermediary exarticulation in July, at Ospitale San Francesco, Brescia; died.—124. TASSANI (GRITTI ROCCO, *loc. cit.*, p. 80), An Italian soldier. Shot fracture of femur, Solferino, June 24, 1859. Intermediary amputation at hip at Ospitale Maggiore, Milan, July, 1859; died.—125. GHERINI (GRITTI ROCCO, *loc. cit.*, p. 80), An Italian soldier. Gunshot fracture of the femur, Solferino, June 24, 1859. Disarticulation about July 26th, at Ospitale San Filippo, Brescia; died.—126. JOHNSON (T. D.) (*Amputation at the Hip Joint, Recovery*, in *Pacific Med. and Surg. Jour.*, N. S., Vol. II, 1868–69, p. 305), A man of San Juan, Monterey Co., received a shot from a Colt's revolver, in July, 1862; ball shattered the entire shaft of femur. Dr. JOHNSON exarticulated two days after the injury. The patient recovered, and was still living, in 1868, at the New Almaden mine, in Santa Clara County.—127. VILLAGRAN (J. M. B. de) (*Observacion de una herida de arma de fuego situada en el muslo izquierdo complicada con fractura comminutiva del femur: desarticulacion coxo-femoral a los* 180 *dias, y muerte del enfermo a los* 259, in *Gaceta Médica de Mérico*, 1865, Vol. I. p. 164), Roman Medina, age 26, shot Nov. 2, 1863, in the left thigh, and admitted to hospital at San Pablo, Nov. 8, 1863. Disarticulated May 11, 1864; death July 29, 1864.—128–129. LANGENBECK (B. von) (*Schussfracturen der Gelenke*, Berlin, 1868, p. 20), Danish soldier, wounded at Alsen, June 29, 1864; disarticulation July 1st; died July 8, 1864, of septicæmia; and Danish soldier, wounded at Alsen, June 29, 1864; disarticulated at right hip June 30th; death July 5, 1864.—130–131. LANGENBECK (B. von) (*Die Schussfracturen der Gelenke*, Berlin, 1868, p. 21), Austrian soldier, wounded at Koenigsgrätz, July 3, 1866; exarticulated at left hip July 10th; death July 14, 1866, of septicæmia. Austrian soldier, wounded at Koenigsgrätz, July 3, 1866; amputation at right hip July 17th; death July 24, 1866.—132. LINHART (W.) (BECK, B., *Kriegschir. Erf.*, 1867, p. 340) performed secondary disarticulation at the hip in 1866, at Würzburg, for comminution of upper part of femur. Patient died a few hours after the operation.—133. FISCHER (K.) (*Militairärztliche, Skizzen*, Arau, 1867, p. 78) mentions a case in which disarticulation at the hip was performed unsuccessfully for hæmorrhage, in the Austro-Prussian campaign of 1866.—134. HEYFELDER (J.) (*Gaz. méd. de Paris*, 1867, p. 541) states that an unsuccessful disarticulation at the hip was performed at the hospital at Nedelischt, in charge of Dr. WILDE, after the battle of Koenigsgrätz, July 3, 1866.—135. MANNEL (OTTO) (*Kriegschirurgische Beobachtungen im Cadetenhaus Kriegslazareth zu Dresden*, in *Allgemeine Wiener Med. Zeitung*, 1867. Jahrg, XII, p. 403), Musquetier B——, 1st Thüringian Infantry, No. 31, wounded July 3, 1866, near Hradeck, in the left femur. Exarticulation October 4, 1866, by Stabsarzt Dr. KÜHNE; died October 8, 1866.—136. Dr. J. HEYFELDER (*Gaz. Méd. de Paris*, 1867, p. 540) reports that a second amputation at the hip was performed at the hospital at Hradeck, in 1866, which proved fatal in about forty-eight hours.—137. FAYRER (J.) (*Gunshot Wound; Amputation at the Hip Joint*, in *Edinburgh Med. Journal*, 1868, Vol. XIII, II, p. 793), Lieutenant H——, shot accidentally, on the Island of Ceylon, Sept. 12, 1867, over the left tuber ischii, ball lodged; fracture of neck of femur not detected. Exarticulation at left hip Sept. 25th; died three hours after the operation.—138. ASHHURST (JOHN, jr.) (*Case of Amputation at the Hip Joint for Gunshot Fracture of the Head and Neck of the Femur*, in *Am. Jour. Med. Sci.*, 1869,

one hundred and eighty-three, presenting sixteen recoveries. We thus arrive at an aggregate of two hundred and fifty cases of exarticulation at the hip as the present status of this grave mutilation in military surgery, with twenty-seven recoveries, two hundred and twenty-two deaths, and one example with unknown result, or a mortality rate of 89.1 per cent. We will next notice the details of the sixty-six cases of hip joint amputations of the American civil war as classified in TABLE XIV.

Vol. LVII, p. 94), E. B——, Irish woman, aged 22, shot in the right hip, in Aug., 1867, at Tacony, Pennsylvania. Exarticulation on Jan. 14, 1868; death in three hours.—139. CAROTHERS (A. E.) (*Amputation at the Hip Joint*, in *Am. Jour. Med. Sci.*, 1873, Vol. LXV, p. 92), Juan Blanco, aged 14; Saltillo, Mexico, Dec. 5, 1871. Intermediary operation Dec. 15th; recovery.—At least forty-four exarticulations at the hip were performed during the Franco-Prussian War, 1870–71.—140. Dr. RÜPPEL (DEININGER, *Beiträge zu den Schussfracturen des Hüftgelenks, etc.*, in *Deut. Mil.-ärztl. Zeitschr*, 1874, B. III, p. 304), Chr. Lucia, 3d Brandenburg Field Art., shell laceration, received at Artenay, Dec. 3, 1870. Exarticulation at right hip Dec. 4th; died shortly after the operation, Dec. 4, 1870.—141–143. Generalarzt Dr. BUSCH (*Zweiter Congress der Deutsch. Gesellschaft für Chir.*, in *Berlin Klin. Wochenschrift*, 1873, B. X, p. 273, and DEININGER, *loc. cit.*, p. 306) performed three exarticulations at the hip: Aug. Hensel, 2d Pomm. Grenadier Reg't; fracture of right femur, Metz, Oct. 14, 1870; operation Oct. 15th; death immediately after operation. No particulars of the other two unsuccessful cases are recorded.—144–147. MACCORMAC (W.) (*Notes and Recollections of an Ambulance Surgeon*, etc., London, 1871, pp. 78, 79), Guerieri, 4th Marines, wounded at Sedan, Sept. 1, 1870. Left tibia and upper part of left femur smashed. Admitted to Asfeld hospital Sept. 10th; operation Sept. 18th; death shortly after the operation. Liprendé, wound of back part of left thigh by explosion of shell. Admitted to Asfeld hospital Sept. 10th; operation Sept. 15th; death in six days. Dr. MACCORMAC (*loc. cit.*, p. 80) states that Mr. BLEWITT disarticulated the hip at Balan, "but with no better result than our two cases," and, on page 123, enumerates among the operations at the field hospital at Flöing, under Generalstabsarzt STROMEYER, another hip joint exarticulation with unknown result. Dr. DEININGER also refers to two exarticulations by Dr. FRANK, and cites MACCORMAC as authority. The latter (*loc. cit.*, p. 46), however, only states that "he (Dr. FRANK) afterwards told me there were two cases where operations should have been performed at the hip joint, but this had to be left undone for want of assistance." 148. Ober-Stabs-arzt NEUBER (DEININGER, *loc. cit.*, p. 308) exarticulated in the case of August Schmidt, 70th French Line; shot fracture of femur, Aug. 18, 1870; died Sept. 7, 1870.—149. Ober-Stabs-arzt Dr. LIPPEL (DEININGER, *loc. cit.*, p. 308), at the 8th field hospital of the Tenth Army Corps, at Pont à Mousson, exarticulated for gangrene in the case of Louis Lecoque, shot in the soft parts of the leg; death four hours after the operation.—150. Dr. KOCH (DEININGER, *loc. cit.*, p. 308), at the hospital at Maizery, Private Andreas Wilczynski, 44th Infantry, shot fracture of the right femur immediately below the trochanter, August 31, 1870. Exarticulation October 23, 1870; died of dysentery October 31, 1870.—151. Dr. SACHS (DEININGER, *loc. cit.*, p. 306), at the 9th field hospital of the First Army Corps, at Les Etanges, case of J. Nikelski, private, 12th Co., 43d Infantry; shot fracture of right femur; ball lodged. Metz, Aug. 14, 1870. Exarticulation Sept. 20, 1870; death, from pyæmia, Sept. 25, 1870.—152. Dr. BRANISH, at the hospital at Neudorf (DEININGER, *loc. cit.*, p. 306), disarticulated in the case of Private H. Malton, 66th French line, shot in the left femur August 6, 1870. Operation Sept. 7th; death on day of operation.—153. Generalarzt Dr. WAGNER (DEININGER, *loc. cit.*, p. 306), at the 8th field hospital, First Army Corps, at Gras, Private M. Buddrus, Co. 2, East Prus. Gren., No. 1; shot fracture of right femur near trochanter major, with extensive injury of the soft parts, received at Metz Sept. 1, 1870. Exarticulation Sept. 17th; died upon the operating table.—154. Assistant Surgeon TRENDELENBERG (DEININGER, *loc. cit.*, p. 306), of the 8th field hospital, Third Army Corps, at Vionville, case of Adolph Marschall, private, 52d Infantry. Shot fracture of left knee joint August 16, 1870; extensive suppuration. Exarticulation August 28, 1870; death on the same day.—155. Dr. METZLER (DEININGER, *loc. cit.*, p. 306), at the Hessian field hospital No. 1, Anoux la Grange, exarticulated at the hip in the case of L. Nouveau, 73d French line, wounded August 18, 1870. Operation Aug. 19th; death two hours after operation.—156. Dr. RAYNAUD (GILLETTE, *Remarques sur les blessures par armes à feu observées pendant la siége de Metz* (1870), *et celui de Paris* (1871), in *Arch. gén. de Méd.*, 1872, T. XX, p. 571, and CH. PILLET, *De la suppression de la compression digitale préliminaire, etc.*, Paris, 1873, p. 64) exarticulated at the left hip in a young *garde nationale*, aged 19; death in a few hours.—157. Dr. WIESEMES (B. BECK, *Chir. der Schussverletzungen*, Freiburg, 1872, p. 855), W——, 67th Infantry, wounded before Paris, December 21, 1870, by a shell, fracturing femur to neck. Primary operation; death in twenty-four hours.—158. HUETER (Berlin, *Klin. Wochenschrift*, 1873, p. 250) operated on a French soldier for extensive fracture of femur. The patient died suddenly on the following day from venous hæmorrhage.—159, 160. BŒHME (*Verhandl. der mil.-ärztl. Gesellschaft zu Orleans* 1870–71, in *Deut. Mil.-arztl. Zeitschrift*, 1872, B, I, p. 66), Fracture of femur just below trochanter, arterial bleeding; ligation of femoral; secondary hæmorrhage; exarticulation; died during the operation. Another case proved fatal in a few days.—161. OTT (*Kriegschir. Mittheil. aus dem Reserve Laz. Ludwigsburg*, 1871, p. 52), Harles, a French soldier, wounded at Vionville, Aug. 16, 1870, in right femur close to trochanter. Exarticulation Sept. 24, 1870; death a few hours after the operation.—162. SIMON (G.) (*Verhandl. des Zweiten Congress der Deut. Gesellshaft für Chir.*, in *Berl. Klin. Wochenschr.*, 1873, B. X, p. 261), French officer; fracture of femur—osteomyelitis. Secondary exarticulation; fatal in three days.—163–167. RUPPRECHT (L.) (*Mil. ärztl. Erf., etc., im Jahre* 1870–71, Würzburg, 1871, p. 75) states that four unsuccessful exarticulations at the hip—three primary, one intermediary—were performed at the Bavarian field hospital No. 8, during September and October, 1870, and that a later operation at Verrières also resulted fatally.—168. MUNDY (*Rapport sur l'ambulance de l'ancien corps legislat. du* 19 *Sept.*, 1870, *au* 31 *Janv.*, 1871) exarticulated on December 2, 1870, in the case of Desehamp, 2d Zouaves, for shot fracture of the right femur with injury of the large veins and of the hip joint; fatal.—169. Dr. J. ARNOLD (*Anat. Beiträge zu den Schusswunden*, Heidelberg, 1873, p. 97) gives the case of H. Moulin, wounded at Wörth, August 6, 1870; shot wound of right femur, with fissure; osteomyelitis and necrosis extending to neck of femur. Exarticulation at the hip; death Sept. 22, 1870.—170. Dr. JŒSSEL (SÉDILLOT, *Du traitement des fractures des membres, etc.*, in *Archives gén. de méd.*, 1871, VI^e^ serie, T. 17, p. 421) performed a secondary fatal exarticulation at the hip.—171–183. CHENU (J. C.) (*Aperçu hist. stat. et clin., etc., pendant la guerre de* 1870–71, Paris, 1874, T. I, p. 493) tabulates twenty-three exarticulations at the hip performed on French soldiers. Some details of ten of these cases have just been noticed; of the remaining thirteen cases it is only recorded that all the patients perished.—184. MORTON (T. G.) (*The Cincinnati Lancet and Clinic*, Cincinnati, Jan. 4, 1879, N. S., Vol. II, p. 9), Dominico Ludovess, aged 24, wounded at Sedan, September 1, 1870; amputation of thigh; admitted to Pennsylvania Hospital Nov. 24, 1878; reamputation at hip December 14, 1878. In a letter dated February 19, 1879, Dr. MORTON reports that the "patient is up and about, and would be discharged, but he has no home to go to." Of the 184 cases of exarticulation at the hip here cited, one (STROMEYER'S case, reported by MACCORMAC) must be set aside, since its result was unknown. Of the remaining 183 cases, 16 recovered and 167 proved fatal, a mortality of 91.2 per cent. Of the 53 primary operations, 50, or 94.3 per cent., were fatal. The three recoveries were: LARREY'S sub-lieutenant of dragoons, wounded September 7, 1812, and seen at Oreha three months afterwards; LANGENBECK'S operation on J. Siebold, June 8, 1848; T. D. JOHNSON'S operation on the California miner, July, 1862. Of the 32 intermediary cases, 29, or 90.6 per cent., were fatal. The three successful instances were: G. J. GUTHRIE'S Waterloo case of Duguet, in 1815; L. BAUDENS'S Algerian case in 1836; and CAROTHER'S case of the Mexican lad, in December, 1871. Of the 31 secondary operations, 26, or 83.8 per cent., had a fatal termination. The five successful cases were: BROWNRIGG'S British dragoon, wounded at Merida, December, 1811, and amputated in 1812, who was living, long afterwards, at Spalding, in Lincolnshire, England; ARLAUD'S case of the fusileer, in the Italian War of 1859; ISNARD'S case of the officer wounded at Solferino; Dr. JULES ROUX'S case of the Magenta soldier, in 1859; and NEUDÖRFER'S case of the soldier wounded at Palestro, May 30, 1859, who underwent secondary excision and amputation in December following. Of two re-amputations at the hip (CASES 12 and 184), T. G. MORTON'S operation, in 1878, on a French soldier wounded in 1870, had a successful issue. Of the 66 exarticulations in which the period of operation was unknown, 4 recovered, giving a mortality of 93.8 per cent. The operators in the four successful cases were: The unknown operator, who, in 1798, operated on the English sailor who was examined by Dr. WENDELSTADT; Dr. CHARLES BRYCE, in the case of the British soldier wounded at Athens, in 1827; the Spanish surgeon reported by Dr. BELMUNT to Mr. ALCOCK, who successfully disarticulated in 1835; and RESTELLI, in the Italian revolution in 1848. Of the 16 successful operations, 5 were performed by French surgeons, 4 probably by English, 3 by American, 2 by German, 1 by an Italian, and 1 by a Spanish surgeon.

Primary Operations.—Of twenty-five well authenticated primary amputations at the hip joint practised during the American civil war, one was completely successful. The pensioner, Kelly, whose left lower limb Surgeon Edward Shippen disarticulated more than fifteen years ago, still survives in comfortable health. A brief review of the case will be given, with references to a few of the numerous accounts of it that have been published:[1]

CASE.272.—Private James E. Kelly, Co. B, 56th Pennsylvania, aged 28 years, was wounded, about 9 o'clock of the morning of April 29, 1863, in a skirmish of the 1st division, First Corps, on the Rappahannock, nearly opposite the "Pratte House," below Fredericksburg. A conoidal musket ball, fired from a distance of about three hundred yards, shattered his left femur. A consultation of the senior surgeons of brigades decided that exarticulation of the femur was expedient, and the operation was performed, at four in the afternoon, at the "Fitzhugh House," by Surgeon Edward Shippen, U. S. V., surgeon-in-chief of the 1st division. The single flap method was adopted, and the amputation was accomplished with slight loss of blood. The patient was at first placed in a hospital tent, and was transferred, May 22d, to the Corps Hospital, progressing favorably. By May 28th, all the ligatures had been removed. On June 15, 1863, the patient was captured by the enemy, and was removed to the Libby Prison, in Richmond. Up to this date there had been no bad symptoms. On July 14th, Kelly was exchanged, and was sent to the Annapolis U. S. A. General Hospital. On his admission he was much exhausted by profuse diarrhœa. The internal portion of the wound had united, but the external portion was gangrenous. Applications of bromine were made to the sloughing surface without amelioration. A chlorinated soda lotion was substituted, and in the latter part of July there was a healthy granulating surface. On December 23, 1863, the wound had entirely healed, and Kelly visited Washington, and obtained an honorable discharge from service, and a pension. Kelly then went to his home, near Black Lick P. O., Indiana County, Pennsylvania. A letter, dated January 12, 1865, was received from him at this Office, and represented him as in excellent health and spirits at that time. In the spring of 1868, Kelly went to New York and had an artificial limb adapted by Dr. E. D. Hudson. At that time a photograph was taken representing the appearance of the cicatrix and of the prothetic appliance. A reduced copy of this picture is presented in the accompanying wood-cut (FIG. 89). Front and posterior views of the upper half of the shattered exarticulated femur are introduced among the accessories in the picture. In a pamphlet on *Mechanical Surgery*, New York, 1878, page 31, Dr. E. D. Hudson prints an excellent wood-cut displaying the appearance of the cicatrix and the artificial stump. By this simple and excellent expedient of a padded gutta-percha artificial stump secured to the pelvis by a broad chamois-lined canvas band, Dr. Hudson succeeded in applying satisfactorily and comfortably the ordinary artificial limb for thigh amputations, not only in Kelly's case but in the case of Pt. George W. Lemon, Co. C, 6th Maryland. The specimen of the fractured exarticulated femur is preserved at the Army Medical Museum, as No. 1148 of the Surgical Section. Kelly's disability was rated, March 4, 1874, as total. His pension of $24.00 monthly, was paid in March, 1878, and he was then in tolerably good health, nearly fifteen years after his terrible mutilation. He remains an irrefragable demonstration of a successful primary amputation at the hip after shot injury. There was nothing additional recorded at the Pension Office at the above date.

FIG. 89.—Appearance of stump five years after the operation. [From a photograph.]

Although in the next two instances of primary amputation at the hip it was found impracticable to trace the ulterior histories of the patients, it is known that Surgeon W. M. Compton's patient, *Robinson*, aged 35, was alive and well six months after the exarticulation, and that Private *Williamson*, the subject of Dr. J. T. Gilmore's operation, reached his home in Mississippi, after two months, with his stump fairly cicatrized.

D.), *Mechanical Surgery: Prothetic Appliances and Apparatus.* New York, 1878, p. 31.

CASE 273.—Private *Robinson*, of a Louisiana Regiment, aged 35 years, was wounded at Battery Pemberton, at the confluence of the Tallahatchie and Yalabusha Rivers, on March 13, 1863, by a fragment of a twenty-four pounder shell, fired from one of the United States gunboats attacking the work. Surgeon William M. Compton, 2d Texas, was standing near the wounded man when he fell, and ran to his assistance. Hastily exposing the wound, Dr. Compton found that the immense projectile, consisting of nearly half of an elongated shell, had buried itself in the upper part of the left thigh, smashing the trochanters and neck of the femur and wounding the femoral artery. An assistant compressed the artery at the crural arch, while the necessary preparations for an amputation were made on the spot. Chloroform was administered, and then Dr. Compton made an irregular circular incision through the integuments just above the margin of the huge lacerated wound, dissected up and retracted the skin, trimmed away the lacerated muscles and divided those that were intact, and exarticulated the head of the femur, making, as Dr. Compton described it, an awkward circular amputation. The arteries were now rapidly secured and the wound dressed. Strange to say, the patient reacted with scarcely a symptom of shock. When the influence of the anæsthetic passed away, he was cheerful and even jocular. He was moved to a field hospital, and was treated under Dr. Compton's immediate supervision until March 17th. The febrile reaction was very slight; the appetite never failed; the wound had as healthy an appearance as could be desired. On the fifth day, the patient was sent on a steamer to the large general hospital at Yazoo City. The surgeon in charge of that hospital, Dr. J. M. Greene, writes that the case presented a most extraordinary example of union by the first intention throughout almost the entire extent of the vast wound. The patient left the hospital on April 20, 1863, in fine health and excellent spirits. Dr. Greene received direct intelligence from him near the close of the ensuing September, more than six months subsequent to the operation, and he then reported himself in good condition.[1]

CASE 274.—Private *Williamson*, 13th Mississippi, was wounded at an advanced picket station near Seven Pines, on June 4, 1862. A conoidal musket ball entered the posterior part of the right thigh about two inches below the trochanter major, and, passing forward and downward, made its exit at the middle third of the thigh in front, having badly shattered the femur in its course. The wounded man was carried to the field hospital in charge of Surgeon J. T. Gilmore, C. S. A., in a church building on the road to Richmond, and there placed under the influence of chloroform about two hours after the reception of the injury. After an exploration of the wound, it was decided that amputation should be performed. Dr. Gilmore began the operation with the belief that the comminution of the femur was mainly below the entrance wound, and that by making a long anterior flap the bone might be sawn at least through the trochanters; but when the anterior flap was reflected and the fracture exposed, it was found that fissures extended upward into the neck quite within the capsular ligament, and that disarticulation must be resorted to. A ligature was first placed upon the femoral artery, and the incisions were then extended upward, the joint opened, the round ligament divided, and a short posterior flap formed by cutting downward and outward. Assistants compressed the bleeding orifices of the arteries, which were then rapidly picked up and tied. The amount of blood lost was small. The wound was dressed, and the patient was comfortably in bed within three hours after the reception of the injury. He was put upon a very nutritious regimen, a messenger being sent daily to Richmond for eggs, milk, and other delicacies which could not be procured in camp. Dr. Gilmore attended him for two weeks, during which suppuration was not excessive, and the healing of the wound progressed favorably. He was then placed under the charge of Acting Assistant Surgeon Spinks. Early in July, he was carried to Richmond upon a hand-litter to a private house, at which he received every attention. In the middle of July, six weeks subsequent to the amputation, the wound had entirely healed, and he was allowed to start for his home in Mississippi. Dr. Gilmore learned that he arrived there in safety; but no intelligence was subsequently received from him.

Of twenty-two primary coxo-femoral amputations that resulted fatally soon after operation, the following series of thirteen cases is composed of instances in which the wounds were inflicted by cannon shot, shell fragments, or other large projectiles:

CASE 275.—Private Jacob Barger, Co. B, 26th Pennsylvania, aged 22 years, of robust constitution and sanguine temperament, was wounded on the morning of May 18, 1864, in the attack of Birney's division of the Second Corps upon the intrenchments before Spottsylvania Court House. He was struck by a fragment of shell, which shattered the femur from a little above the trochanter minor for nine inches downward, and tore and mangled the soft parts on the anterior and lateral aspects of the

[1] "*Mississippi State Lunatic Asylum, Jackson, Mississippi, January* 1, 1878. MY DEAR DOCTOR: I herewith enclose a letter from Dr. GREENE, of Aberdeen, Mississippi, the surgeon who treated the case of amputation at the hip joint in the Yazoo City hospital. To explain to you what may appear to be my want of attention in keeping the track of so interesting a case, I will remind you that the operation was performed in the field. The patient was at once conveyed to a steamboat, and as soon as it was full of sick and wounded (a few days) the boat was sent to Yazoo City. Soon after the date of the operation, I was ordered to Vicksburg, where I remained until after the surrender of that city, and for a long time was shut up by the siege from all communication with the outside world. The fall of Vicksburg, in July, was succeeded by the rapid evacuation of Yazoo City, and it was nearly a year before I met Dr. GREENE, in Alabama, who informed me of the recovery of my patient. I had not heard of him after the departure of the steamboat from Fort Pemberton, and did not know that he had fallen into the hands of Dr. GREENE until the doctor informed me himself. I lost my note-book and other papers at Vicksburg and have never had any means of tracing the patient. I will say, however, for Dr. J. M. GREENE, that he stands at the head of his profession in Mississippi, and is in every respect a highly esteemed christian gentleman, and his word in any statement of fact where he is known is received as solid truth. Very respectfully, your obedient servant, (signed) WM. M. COMPTON." "*Aberdeen, Mississippi*, December 29, 1877. DEAR DOCTOR: At the request of Dr. WM. M. COMPTON, of Jackson, Mississippi, I again write to you in regard to the hip joint amputation which he performed at Fort Pemberton, in 1863. I greatly regret my inability to furnish any facts in addition to those contained in a letter which I wrote to you in 1867. I believe I therein told you that the subject of the amputation was received by me in hospital at Yazoo City, Mississippi, in a few days after the operation. So skilfully were the flaps made and so perfect was the coaptation throughout the vast extent of cut surface, that the fibrinous agglutination followed at once, and resulted in union by first intention in all parts except the tracks of ligatures and sutures. I am positive in my recollection that within six weeks from the time of the operation the patient was dismissed from the hospital with the *stump healed*. Information of him reached me some months—I believe about five—afterwards, which I *then* regarded as entirely authentic. It was probably in the form of an application for 'Certificate of Disability' upon which to be 'retired' or 'discharged' from service. At any rate, I am certain that it thoroughly satisfied me of the life and well-doing of the patient. It is to be deplored that in a matter of so much interest to the profession, complete documentary evidence cannot be obtained; but yet I feel assured, from my point of view, that the cause of surgical history can sustain no detriment from placing Dr. COMPTON'S case in the same catalogue as that of Dr. SHIPPEN. Very sincerely, your obedient servant, (signed) J. M. GREENE."

thigh, leaving uninjured a V-shaped portion of integument and subjacent tissue on the antero-internal femoral region, seven inches wide at the base and ten inches in vertical length. He was carried to a field hospital of the Second Corps and examined about two hours after the injury. There was no apparent shock, and there had been very little hæmorrhage. The pulse was full and calm, and the surface of the body was of a natural temperature. The senior surgeons of the division concurred in the opinion that this was one of the few cases of extensive gunshot injury of the femur in which a successful result might reasonably be anticipated from an amputation at the hip joint. The patient was desirous that an operation should be practised. He was of a hopeful, buoyant nature, and was sanguine of a favorable issue. Amputation having been decided upon, chloroform was administered by Surgeon John Wiley, 6th New Jersey, a medical officer of great experience and caution in this duty. Only two drachms of the anæsthetic was used, given from a napkin, with great regard to a due admixture of atmospheric air. Surgeon C. C. Jewett, 16th Massachusetts, performed the amputation by making a single antero-internal flap. Assistant Surgeon J. T. Calhoun, U. S. A., and others present on the occasion, have described the admirable dexterity and skill manifested in the operative procedure. The disarticulation was completed in less than forty seconds. Surgeon C. K. Irwine, 72d New York, compressed the crural artery at the groin; Surgeon F. Prentice, 73d New York, grasped the flap and secured the cut end of the femoral; Surgeon James Ashe, 70th New York, had charge of the limb; Surgeon Everts, 20th Indiana, Surgeon E. A. Whiston, 1st Massachusetts, and Assistant Surgeon J. T. Calhoun, U. S. A., also aided in the operation. The flap, the form and location of which were determined by the wound, was made by cutting from without inward. Immediately after the head of the bone was freed from the acetabulum a spasmodic catch was heard in the patient's respiration, and an assistant exclaimed: "Stop the chloroform!" Surgeon Wiley promptly responded: "He is not taking any." The next instant an assistant at the wrist reported that the pulse was failing. The arteries were now rapidly secured. The loss of blood was estimated not to exceed a single ounce. But the patient was insensible, the respiration labored, the pulse very slow and feeble. The usual restoratives were employed without effect. The patient did not rally; he lingered for about two hours, and died a little after noon, May 18, 1864. In consequence of an advance of Rhodes's Division of Ewell's Corps the field hospital was hastily broken up. Surgeon Jewett was under the impression that the specimen was lost. This, however, was not the case. Some one fastened a label with the names of the patient and operator to the mangled limb, and it was forwarded, with other pathological specimens, from Spottsylvania to the Army Medical Museum, where it arrived safely, and furnished the preparation represented in the adjoining wood-cut (FIG. 90).[1]

FIG. 90.—Comminution of femur by a shell. *Spec.* 3080.

CASE 276.—On March 9, 1862, in the engagement between the U. S. frigate Congress and the rebel iron-clad Merrimac, Private J. Bushmil, 99th New York, or Union Coast Guard, detailed as a seaman on the Congress, was wounded by a piece of shell, which tore away the muscles on the outer side of the left thigh so as to expose the bone, and comminuted the neck and trochanters of the femur. He was immediately conveyed to the military post hospital at Newport News, Virginia, which was distant but a few hundred yards from the anchorage of the Congress, and restoratives and stimulants were administered. Eight hours after the injury, reaction having taken place to a considerable degree, the patient was placed under the influence of chloroform by Surgeon R. K. Browne, U. S. V., and Surgeon Leroy McLean, 2d New York, amputated at the hip joint by the lateral double-flap method of Larrey. His principal assistants were Dr. Everts, Dr. R. K. Browne, and Surgeon J. Curtis, U. S. V. The operation was rapidly accomplished, with the loss of but little blood. Six arteries required ligature. The patient did not rally from the shock of the operation, and died in less than two hours after its completion.[2]

The details of the next primary amputation at the hip (CASE 277), communicated by Dr. F. J. Bancroft, of Denver, Colorado, have not been heretofore published:[3]

CASE 277.—"Captain Ralph Carlton, Co. I, 3d New Hampshire, received a severe wound in the left hip and thigh from a cannon ball or a fragment of a shell at the battle of Secessionville, on James's Island, June 16, 1862. The trochanters were fractured and the femur was shattered and laid bare for several inches below. The gluteus maximus muscle was severed from its insertion, and the biceps and semi-membranosus were torn asunder. Amputation at the hip joint was performed about two hours after the reception of the injury by some surgeon whose name I have forgotten, assisted by myself. The anterior flap was made by transfixion and carried well down the limb. The posterior one was short and made by paring the torn ends of muscles and the skin. The patient did not rally, and died about two hours thereafter, although he possessed, apparently, a strong will and a good constitution, and was suffering but moderately from shock at the time of the operation. When told of the dangers

[1] The abstract of this case is compiled from a full report by Surgeon C. C. JEWETT, 16th Massachusetts, of Holliston, and from communications by Assistant Surgeon J. C. CALHOUN, Surgeon H. F. LYSTER, U. S. V., Assistant Surgeon J. D. STEWART, 74th New York, Major SAMUEL BRECK, A. A. G. See *Catalogue of Surg. Sect. of A. M. M. of* 1866, p. 234, *Spec.* 3080 of SECT. I. See *Circular* 7, S. G. O., 1867, pp. 30 and 59, and LÜNING (A.), *Über die Blutung bei der Exarticulation des Oberschenkels*, Zürich, 1877, CASE 324, p. 96.

[2] The imperfect abstract of CASE 276 is compiled from letters from Surgeon G. C. HARLAN, 11th Pennsylvania Cavalry, Surgeon R. B. BONTECOU, U. S. V., Dr. RUFUS KING BROWNE, and Dr. LEROY MCLEAN, 2d New York. See *Circular* 7, S. G. O., 1867, pp. 24 and 57, and LÜNING (A.), *Über die Blutung bei der Exarticulation des Oberschenkels*, Zürich, 1877, p. 90, CASE 281.

[3] The particulars of this case were first communicated to the Surgeon General's Office by Dr. F. J. BANCROFT, of Denver, Colorado, formerly Surgeon of the 3d Pennsylvania Artillery, November 26, 1875. Captain CARLTON'S regimental surgeon, Dr. A. A. MOULTON, 3d New Hampshire, wrote to the Surgeon General's Office from Tilton, New Hampshire, December 9, 1875, that he "did not see Captain CARLTON, but *heard* that his limb was amputated at or near the hip joint." A search at the Pension Office corroborates the dates of the injury as reported by Dr. BANCROFT. On June 16th, the 3d New Hampshire was in a brigade comprising the 97th Pennsylvania, 7th Connecticut, and 3d Rhode Island Artillery. Enquiries regarding the case were addressed to Surgeon J. R. EVERHART, 97th Pennsylvania, to Assistant Surgeon H. P. PORTER, 7th Connecticut, and Surgeon H. G. STICKNEY, 3d Rhode Island Artillery, medical officers of the brigade of General I. I. STEPHENS, and also to Surgeon E. L. DIBBLE, 6th Connecticut, and Surgeon P. A. O'CONNELL, 28th Massachusetts, New England medical officers who were present at the engagement on James Island, on June 16, 1862; but no further information could be elicited from any surgeon present at this operation in addition to the details recorded by Dr. F. J. BANCROFT, formerly Surgeon 3d Pennsylvania Artillery.

attending and following the amputation, I well remember how earnestly and energetically he said: 'I desire it. I must live. I will live. I have a wife and five children to provide for.' Yet in two short hours all earthly ties were severed." Surgeon A. A. Moulton, 3d New Hampshire, reported that Captain Carlton died on June 16, 1862, of "gunshot wound," and in the military history of the regiment, published by the Adjutant General of the State in 1866, he is mentioned as "a gallant and promising officer," who during said engagement "was hit in both legs by a solid shot, and died the same day."

CASE 278.—Private *Cooper*, of an Alabama Regiment, aged 20 years, was wounded at the siege of Vicksburg, on May 22, 1863, by a fragment of shell, which inflicted a terrible laceration of the upper exterior part of the right thigh, comminuted the upper third of the femur, and fractured the tuberosity of the ischium. There was profuse hæmorrhage. Surgeon W. M. Compton, 2d Texas, decided to operate, because the wounded man most earnestly begged that an attempt should be made by amputation to save his life. A few hours after the reception of the injury he was placed under chloroform, and amputation at the right hip joint was rapidly performed by making a large anterior flap and dividing the soft parts posteriorly by a circular sweep of the knife. The stump was dressed and the patient actively stimulated, but he never rallied from the shock of the operation, and died in less than an hour after its accomplishment.[1]

CASE 279.—Private Isaac C. Fulton, Co. I, 4th New York Heavy Artillery, was wounded, on October 1, 1864, in the trenches before Petersburg, by a fragment of shell, which shattered the upper extremity of his left femur and lacerated the soft tissues on the outside of the thigh, without, however, implicating any important vessels or nerves. He was immediately carried to the Second Corps field hospital, under the charge of Surgeon F. F. Burmeister, 69th Pennsylvania, and a consultation was held, at which it was determined that an amputation at the hip joint was the only resource that could possibly preserve life. The wounded man was, therefore, immediately placed under the influence of chloroform, and Surgeon J. W. Wishart, 140th Pennsylvania, did the operation. The ordinary method by antero-posterior flaps formed by transfixion was employed. The operation was rapidly performed and but a trifling quantity of blood was lost. The patient survived the shock of the injury and operation but a few hours, and died at City Point, October 1, 1864.

CASE 280.—Private Richard Gordon, Co. H, 7th Rhode Island, a stout and apparently healthy man, aged 28 years, was wounded May 18, 1864, in one of the assaults on the lines at Spottsylvania, and was carried on a stretcher, two or three miles to the rear, to a field hospital of the Ninth Corps. A fragment of shell had completely shattered the left thigh, leaving the lower part of the limb attached to the upper by shreds of integument and muscles only. There had been but slight primary hæmorrhage. He was conscious and his pulse was perceptible; but he was in extreme collapse. A consultation was held, at which the Surgeon-in-chief of the division, Surgeon P. A. O'Connell, Surgeon James Harris, 7th Rhode Island, and others, assisted, and it was determined to give the man the chance of an operation rather than to allow him to die without an effort to save him, and Dr. J. M. Carnochan, who had volunteered his services at the hospital, was selected to operate. Chloroform was carefully administered by Surgeon Harris, and Dr. Carnochan, as a preliminary step, tied the femoral artery three-quarters of an inch below Poupart's ligament, and then proceeded to amputate at the hip joint by a modification of the oblique method of Guthrie. A vertical incision three inches long, commencing an inch above the great trochanter, was made, the soft parts being divided down to the bone. From the lower third of this incision, two oblique incisions, one before and one behind, were made to diverge and then to reunite about two and a half inches below the level of the ischiatic tuberosity. The head of the femur was then disarticulated, and the knife being carried to the inner side of the neck the operation was finished by dividing the soft parts on that side by a single sweep of the instrument. The operation, including the ligation of the femoral, was completed in two minutes. The patient recovered kindly from the influence of the anæsthetic. He was placed in a shelter tent and took a dose of opium. He died ten hours after the operation, no reaction having taken place.[2]

CASE 281.—Brevet Lieutenant-Colonel J. H. Janeway, Assistant Surgeon, U. S. A., learned that Dr. Hunter McGuire, Surgeon-in-chief of Ewell's Division, performed a primary amputation at the hip after the engagement at Ball's Bluff, October 21, 1861, upon a Union prisoner of war, with a frightful injury of the upper part of the femur, caused by a large projectile, and that the patient succumbed to the combined shock of the injury and operation soon after the completion of the latter.

CASE 282.—A lieutenant in an Arkansas Regiment in Cabell's Brigade, aged 28 years, was wounded at the attack on Corinth, Mississippi, October 3, 1862. A solid cannon ball struck the right hip and made a formidable wound, tearing up the soft parts of the buttock and shattering the upper extremity of the femur. The trochanters and about five inches of the shaft of the femur were comminuted; the head of the femur was exposed and was split across. It was decided that amputation at the hip presented the only possible surgical resource, and the operation was undertaken, two hours after the injury, by Surgeon W. M. Compton, 2d Texas. The operation consisted in paring into shape the lacerated soft parts at the posterior part of the thigh, completing the disarticulation already partly effected by the projectile, and forming a large and long antero-internal flap. The patient was under the influence of chloroform. There was but little hæmorrhage. The flap covered the immense wound and was adjusted with tolerable accuracy to meet the incision at the gluteal region. The combined shock of the injury and operation was very great, and the patient reacted slowly and with difficulty. But he rallied finally, and progressed very favorably for several days. The inflammation was not intense, appetite returned, and strong hopes of the patient's recovery were entertained. But, on the seventh day, erysipelas invaded the stump and extended rapidly, in spite of the use of tincture of iron and such other treatment as it was thought proper to institute. The case terminated fatally on October 12, 1862.[3]

CASE 283.—A private in General A. S. Johnston's army was wounded on the morning of Sunday, April 7, 1862, at the battle of Shiloh, by a fragment of shell, which shattered the upper extremity of the left femur. The comminution extended to the neck and head of the bone, and the soft parts at the upper third of the thigh were torn into shreds. Notwithstanding the

[3] EVE (P. F.), *A Contribution to the History of the Hip Joint Operations performed, etc.*, in *Transactions of the Am. Med. Ass'n*, 1867, Vol. XVIII pp. 255, 262. *Circular* No. 7, S. G. O., 1867, pp. 25, 58.

terrible nature of the injury the patient reacted, and it was thought, in the evening, that his condition justified amputation. At seven in the evening disarticulation at the hip joint was performed by Dr. D. W. Yandell, Medical Director. The operation was well borne; but about three hours after its completion symptoms of exhaustion were manifested, and the case terminated fatally seven hours after the operation, at two o'clock of the morning of April 8, 1862.[1]

CASE 284.—A private of the 3d Missouri Regiment was wounded at the siege of Vicksburg, in June, 1863, by a large fragment of shell. The projectile produced a frightful laceration of the tissues on the inner and posterior parts of the right thigh, completely divided the femoral artery, and comminuted the femur through an extent of eight or nine inches. A surgeon in the trenches put a ligature on the femoral artery, and the wounded man was conveyed to the City Hospital and was plied with cordials. The sufferer had but recently recovered from an attack of illness; the primary hæmorrhage had been copious, and reaction was very imperfect. A consultation of surgeons decided that amputation at the hip joint should be practised, and the wounded man expressed a desire to have the benefit of this forlorn chance. Surgeon B. D. Lay undertook the operation with great reluctance, fearing that the patient might die under the knife, he was so very feeble. Stimulants were freely administered and morphia; but it was decided that the operation should be done without anæsthetics. The nature of the wound determined the direction of the incisions. There was a rent in the soft parts laying bare the tuberosity of the ischium, and another extending nearly to Ponpart's ligament, in which the ligated femoral artery was hanging. Dr. Lay commenced the operation, in the presence of Surgeons Britts, McDowell, Nidelet, and others, by making a clean circular cut through the inner and posterior parts of the thigh, dividing all the soft parts down to the articulation; a semilunar flap was then obtained from the outer and anterior part by cutting from without inward; the head of the femur was then disarticulated. Eight ligatures were required. The flap fitted well. The operation, which occupied about twenty minutes, was well supported, and the patient said that he felt more comfortable after than before it. However, reaction was never fully established. Dr. Nidelet relates that the patient died upon the table within an hour and a half after the completion of the dressing. Dr. Lay's recollection is that he survived the operation some fourteen or sixteen hours.[2]

CASE 285.—A private of the 27th Tennessee Regiment was wounded at Jonesboro', Georgia, August 31, 1864, by a cannon shot, which frightfully lacerated the soft parts on the upper and outer part of the thigh and shattered the femur, the splintering extending quite to the neck of the bone. Six hours after the injury, Surgeon J. R. Buist, 1st Tennessee, of Cheatham's Division, removed the limb at the hip joint by the antero-posterior flap method by transfixion. The patient was rendered insensible by chloroform. He rallied promptly from the anæsthetic and from the shock of the operation. Cold-water dressings were applied to the stump, and stimulants and concentrated nourishment were administered. After about eight hours the patient began to sink, and he died thirty-six hours after the operation, September 2, 1864.[3] In a letter, dated Nashville, Tennessee, March 25, 1867, Dr. Buist states: "I am sorry to say that the exsected head of the femur was not preserved, nor a photographic drawing taken."

CASE 286.—Private William Waters, Co. K, 123d New York, was wounded at Resaca, Georgia, on May 15, 1864, by a large fragment of shell, which completely carried away his left thigh and fractured both the tibia and fibula of the right leg. He was carried to a field hospital of the Twentieth Corps, and as soon as he had partially rallied from the shock of his frightful injuries chloroform was administered, and Surgeon J. W. Brock, 66th Ohio, amputated at the left hip joint: and then removed the right leg at the place of election. The patient survived the double operation but a short period. The exact length of time is not stated; but he died in the afternoon of the day on which he was wounded, May 15, 1864.[4]

CASE 287.—Private Elisha Wayland, Co. E, 34th Iowa, had his right thigh almost completely torn off at the hip joint, at the siege of Vicksburg, July 3, 1863, by an unexploded shrapnel shell. He was hurriedly conveyed to a field hospital, but bled very profusely during the short transit, and is represented as almost exsanguineous upon reaching the hospital. His regimental surgeon, Charles W. Davis, 34th Iowa, having mastered the hæmorrhage, had the patient placed under chloroform, ligated the femoral artery, divided the lacerated soft parts which still connected the mutilated limb with the trunk, and then formed a single large anterior flap, and exarticulated the femur. The patient survived the operation two hours, and died July 3, 1863.[5]

In five of the foregoing examples (CASES 273, 280, 284, 286, 287) and in CASE 289, to be cited presently, primary disarticulation at the hip appeared to be of absolute urgency, since the graver injuries of the femur were, in each case, conjoined with lesions of the femoral artery.

---

[1] The particulars of this case were communicated to the Surgeon General by Professor P. F. EVE in a letter dated Nashville, March 5, 1867. See also EVE (P. F.), *loc. cit.*, p. 253, and *Circular* No. 7, S. G. O., 1867, pp. 24 and 57; LÜNING (A.), *op. cit.*, p. 90.

[2] The abstract of this case was compiled from data furnished by the operator, Dr. BENJAMIN D. LAY, in charge of the City Hospital, at Vicksburg, during the siege, in a letter to the editor, dated Paducah, July 26, 1867. Dr. LAY, who reluctantly undertook the operation, closes his account with the following remark: "I saw nothing in it to diminish the horror with which I approach such cases, of which I have had the misfortune to have three. I have been present at three others. All were fatal." See *Circular* No. 7, S. G. O., 1867, pp. 27, 58; EVE (P. F.), *loc. cit.*, pp. 253, 258; LÜNING (A.), *op. cit.*, p. 94.

[3] The facts in this case were furnished by Professor PAUL F. EVE, from a carefully written account by the operator, Surgeon J. R. BUIST, 1st Tennessee. See *Circular* No. 7, S. G. O., 1867, pp. 31, 59; EVE (P. F.), *loc. cit.*, pp. 253, 258; LÜNING (A.), *op. cit.*, 97.

[4] The abstract of this case was made from field returns signed by Surgeon G. E. COOPER, U. S. A., Medical Director, Surgeon A. L. COX, U. S. V., and Surgeon A. BALL, 5th Ohio. See *Circular* No. 6, S. G. O., 1865, p. 50; *Circular* No. 7, S. G. O., 1867, pp. 29, 58; LÜNING (A.), *op. cit.*, p. 96.

[5] This abstract was compiled from notes of the case on the Monthly Report of Sick and Wounded of the 34th Iowa, for July, 1863. In a letter to the editor, dated Indianola, Iowa, June 1, 1869, the operator, Dr. C. W. DAVIS, writes: "In reply to yours of May 1st, I will say, after examining my Army surgical notes, I notice the case of E. M. Wayland, Co. E, 34th Iowa Volunteers. Disarticulation of hip joint, on the right side. The femur was fractured at upper third; also laceration of the tissues, muscles, and vessels of the posterior part of the leg as far up as the insertion of the gluteus maximus. I performed the amputation by the single anterior flap operation, ligating the artery before disarticulating the head of the femur. The operation was neat and made a perfect stump, but the patient lived *only* forty-seven hours." See *Circular* No. 2, S. G. O., 1869, p. 108.

The following nine fatal cases of primary amputations at the hip were for wounds inflicted by small projectiles. In one instance (CASE 294), the patient survived the operation at least eleven days; in another (CASE 293), the patient had rallied so far that it was considered safe to move him, but he succumbed on the road, forty-eight hours after the operation. The remaining seven patients died within a few hours.

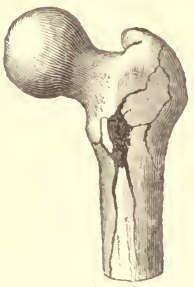

FIG. 91.—Shot fracture through the trochanters of the left femur. [From a drawing by Surgeon H. Z. GILL, U. S. V.]

CASE 288.—Private James A. Alling, Co. D, 3d Wisconsin, was wounded on March, 16, 1865, at the battle of Averysboro', North Carolina, by a conoidal musket ball, which entered the upper part of the left thigh in front, and produced a comminuted fracture of the femur through the trochanters, with longitudinal splintering extending a short distance down the shaft and upward within the capsular ligament. The wounded man was conveyed to a field hospital of the Twentieth Corps. Chloroform was administered and the wound was thoroughly explored, and it was determined to amputate at the hip joint, because it was imperative to move the wounded on the following day over rough roads, and either an excision of the head of the femur, or an attempt at conservation of the limb, offered, under the circumstances, less chance of a favorable result than the removal of the limb. Five hours after the reception of the injury, Surgeon H. Z. Gill, U. S. V., amputated by double flap. The patient reacted well after the operation, but the amendment was of brief duration. He died seven hours after the completion of the amputation, March 17, 1865. A drawing of the shattered extremity of the femur, contributed by the operator, is presented in the adjacent wood-cut (FIG. 91).[1]

CASE 289.—Corporal Wad Brookins, Co. C, 49th U. S. Colored Troops,[2] was accidentally shot, in the regimental camp, near Transylvania Landing, Louisiana, on September 3, 1863. He was struck in the upper third of the left thigh, at close range, by a musket ball, which divided the femoral artery and badly comminuted the thigh bone. Assistance was immediately rendered, and the copious hæmorrhage was controlled by compression. Prompt preparations having been made, the thigh was amputated at the hip by Surgeon Sylvester Lanning, 49th U. S. C. T. The patient died from the hæmorrhage and shock, four hours after the completion of the operation, September 3, 1863.

CASE 290.—Private J. M. Brown, Co. H, 63d Indiana, was wounded on June 16, 1864, in the attack of the Twenty-third Corps upon the earthworks at Lost Mountain, near Marietta, Georgia. A conoidal musket ball struck his right thigh and shattered the upper extremity of the femur, fissures extending through the trochanter major. He was conveyed to the field hospital of the Twenty-third Corps, and on June 17th, about fourteen hours after the reception of the injury, he was placed under the influence of chloroform, and after a careful examination of the injury, it was decided to amputate at the hip joint. The operation was performed by Surgeon Edward Shippen, U. S. V. The operative method was similar to that adopted by Dr. Shippen in his successful operation (CASE 272). Comparatively little blood was lost, but the patient succumbed to the shock of the operation and died upon the operating table very soon after the completion of the disarticulation.[3]

FIG. 92.—Comminution of femur by a rifle ball. *Spec.* 2273.

CASE 291.—Seaman George Cook, aged 21 years, an Englishman, was wounded on February 1, 1864, in an engagement of a gunboat with a battery supported by sharpshooters, at Smithfield, Virginia. A rifle ball grazed his right thigh, passed through both testicles and entered the left thigh, fractured the femur, and passed out at the posterior and outer portion of the limb. The wounded man was taken to the Naval Hospital, at Portsmouth, Virginia, not many miles distant, and Surgeons Solomon Sharp, A. C. Gorgas, John Paul Quinn, and Assistant Surgeon G. S. Franklin, U. S. N., held a consultation, at which it was decided that the femur was extensively shattered, and that an amputation at the hip joint presented the only chance of saving the patient's life. On the morning of February 2d, the patient was placed under the influence of chloroform, the femoral artery was compressed at the groin, and Surgeon Gorgas, assisted by his colleagues, proceeded to remove the limb. The operation was performed by transfixing and forming an anterior flap, disarticulating, and then making a posterior flap by cutting from within outward. Very little blood was lost; yet the patient never reacted, but succumbed about two hours after the completion of the operation. The shattered femur was forwarded by Surgeon Gorgas to the Army Medical Museum. It is represented in the adjacent wood-cut (FIG. 92). It is a very strong and compact bone. The ball has separated five large fragments, and has produced fissures extending from above the level of the trochanter minor a little over four inches down the shaft.[4]

CASE 292.—"Private John W. Dadds, Co. B, 4th Maryland, was wounded on the morning of May 12, 1864, at the battle of Spottsylvania, by two musket balls, one of which shattered his left tibia and fibula, while the other passed through the left

[1] The notes in this case were furnished by the operator, Surgeon H. Z. GILL, U. S. V. See *Circular* No. 7, S. G. O., 1867, pp. 31, 59; LÜNING (A), *Über die Blutung bei der Exarticulation des Oberschenkels, etc.*, Zürich, 1877, S. 102.

[2] The regiment was styled at the period "11th Louisiana Regiment of African Descent." Its designation was changed, March 11, 1864, to "49th United States Colored Troops." The case was reported on the Monthly Report of Sick and Wounded of the 11th Louisiana Regiment of African Descent, signed by the operator, Surgeon SYLVESTER LANNING. See *Circular* No. 2, S. G. O., 1869, p. 108; LÜNING (A.), *op. cit.*, p. 93.

[3] *A Report of Surgical Operations during the Atlanta Campaign in* 1864, collected by Surgeon A. M. WILDER, U. S. V., furnished the data in this case. This is one of the two fatal cases referred to by Dr. EDWARD SHIPPEN, the operator, in connection with an account of his successful amputation at the hip (CASE 272, *ante.*), published in Professor FRANK H. HAMILTON'S *Treatise on Military Surgery*, New York, 1865, p. 485. A special report from Dr. SHIPPEN, dated January 13, 1866, contains no further particulars. See *Circular* No. 6, S. G. O., 1865, p. 50; *Circular* No. 7, S. G. O., 1867, pp. 31, 59; LÜNING (A.), *op. cit.*, p. 97.

[4] An account of this case was forwarded to the Surgeon General's Office by the operator, Surgeon ALBERT C. GORGAS, U. S. N., together with the pathological preparation. See *Circular* No. 6, S. G. O., 1865, p. 50; *Circular* No. 7, S. G. O., 1867, pp. 28, 58; *Catalogue of the Surg. Sect. of the Army Medical Museum*, 1866, p. 233; LÜNING (A.), *op. cit.*, p. 96.

thigh, comminuting the femur at the trochanters. He was carried to the field hospital of the 2d division of the Fifth Corps, where a consultation was held by the senior surgeons present. After a careful exploration, under chloroform, it was determined that the thigh wound involved the hip joint. It was decided that an excision of the head of the femur, or a resort to expectant treatment, were alike forbidden by the grave compound fracture of both bones of the leg, which complicated the thigh fracture, and that there was no alternative but coxo-femoral amputation. Accordingly, stimulants were administered, and every means were employed to bring about reaction, and, three hours after the reception of the injury, Surgeon Enos G. Chase, 104th New York, proceeded to remove the limb. He performed the double-flap operation, sometimes described as Béclard's, transfixing the thigh and forming a large flap in front, disarticulating and then cutting from within outward to make a posterior flap. The vessels were then rapidly secured. The patient survived the operation twelve hours."[1]

CASE 293.—Private James Martin, Co. I, 146th New York, aged 20 years, was wounded on July 13, 1863, in one of the reconnoissances of General Lee's position near Williamsport. He was carried to the rear and placed in a barn by the roadside not far from Williamsport. On the following morning a consultation was held in the case, at which Assistant Surgeons Howard, C. Wagner, and Colton, U. S. A., and Drs. Stearns, Lord, Dean, and others assisted. It was found that a conoidal musket ball had passed through the upper part of the left thigh from before backward, and had struck the femur a little below the great trochanter and produced a comminuted fracture. It was believed that the fracture extended into the coxo-femoral articulation, and it was decided that no operative procedure could be advantageously practised except an amputation at the hip joint. Dr. Howard was invited to operate. Chloroform having been administered, he removed the limb by a double-flap operation. He describes the operation as performed by "entering the knife about four or five inches below the anterior superior spinous process of the ilium, and causing it to emerge by transfixion an inch and a half to the inside of the course of the femoral vessels. The operation was completed in the ordinary manner of flap amputations. By transfixing at the points described, the mouths of the divided vessels were so near the margin of the anterior flap as to be readily seized immediately after division, and by the external obliquity of the plane of incision drainage of pus was facilitated more than by the ordinary horizontal antero-posterior flaps." It appears that the disarticulation was rapidly accomplished, and that very little blood was lost. The shock was great, but the patient is reported to have rallied so far that it was considered safe to move him. On July 16, 1863, he died on the road to Sharpsburg, about forty-eight hours subsequent to the operation. An examination of the specimen from this case, which was forwarded by Assistant Surgeon Howard to the Army Medical Museum, and is represented in the wood-cut (FIG. 93), justified the opinion formed before the operation, that an excision of the head of the femur was impracticable; for besides the comminution about the lesser trochanter and the fissures towards the neck, fissures ran down the shaft of the bone for a long distance.[2]

FIG. 93.–Comminuted shot fracture of femur. *Spec.* 1379.

CASE 294.—A private soldier of Major Douglass's Cavalry was accidentally wounded by a comrade near Lavergne, Tennessee, on October 19, 1862. The injury was inflicted by a round ball, with buckshot, fired from a fowling-piece, the muzzle being within a few inches of the person of the man who was wounded. The charge passed directly through the thigh just below the trochanters, comminuted the femur, and extensively lacerated the soft parts. The operation was performed eight hours after the reception of the injury. Chloroform was administered until anæsthesia was complete. Then an assistant controlled the femoral at the groin, and the operator, Dr. J. F. Grant, P. A. C. S., entered the point of a knife twelve inches long an inch below the anterior superior spinous process of the ilium and transfixed, according to Lisfranc's method, on the outer side of the femur, bringing the point out near the tuberosity of the ischium, and cutting an external and posterior flap five inches long. The gluteal and sciatic arteries were then tied; then an antero-internal flap was cut and the head of the bone was disarticulated. He was taken to the neighboring house of a widowed lady on the Murfreesboro' pike, between Lavergne and Nashville. Here he was seen by Dr. Grant on October 22d, and seemed in every respect to be doing well. On this day that locality was occupied by United States troops and Dr. Grant did not see his patient again. He received a message from him on October 30th, but no subsequent information. It is altogether probable, therefore, that the patient died.[3]

CASE 295.—A private of the 18th Mississippi Regiment, of Barksdale's Brigade, a robust man, under thirty years of age, received a shot fracture of the upper extremity of the left femur, at Malvern Hill, July 1, 1862. The injury was probably caused by a conoidal musket ball, and there was great splintering of bone, extending to the neck. Early on the morning of July 2d the patient inhaled chloroform, and amputation at the hip joint was performed by Surgeon J. T. Gilmore, P. A. C. S., by forming anterior and posterior flaps by transfixion. There was no reaction, and the patient died from the shock of the operation an hour or two after its completion.[4]

CASE 296.—A private of the 21st Mississippi Regiment, a young healthy man, was wounded at Malvern Hill, July 1, 1862, by a conoidal musket ball, which fractured the left femur through the trochanters and neck. Twelve hours after the reception of the injury he underwent amputation at the hip joint. The operation was performed under chloroform, by Surgeon J. T. Gilmore, by the antero-posterior flap method, the flaps being formed by transfixion. The patient only partially reacted after the operation, and, though he lingered until the morning of July 4th, he died apparently from the shock of the operation.[5]

---

[1] At the date of the publication of *Circular* No. 7, in 1867, various reports regarding this case led to the belief that the head of the femur had been excised. A report of the case, by Surgeon ENOS G. CHASE, 104th New York, the operator, was finally discovered in time for publication in *Circular* No. 2, 1869, at page 107; LÜNING (A.), *op. cit.*, p. 96.

[2] Assistant Surgeon BENJAMIN HOWARD, U. S. A., the operator, and Surgeon T. M. FLANDRAU, 146th New York, communicated the facts in this case. See *Circ.* No. 6, S. G. O., 1865, p. 50; *Circ.* No. 7, S. G. O., 1867, pp. 28, 58; *Cat. Surg. Sect. A. M. M.*, 1866, p. 233; LÜNING (A.), *op. cit.*, p. 94.

[3] The abstract of this case was compiled from data furnished by Professor PAUL F. EVE. See *Circular* No. 7, S. G. O., 1867, pp. 25, 28; EVE (P. F.), *loc. cit.*, pp. 254, 260; LÜNING (A.), *loc. cit.*, p. 91.

TABLE XV.

Summary of Twenty-five Cases of Primary Amputation at the Hip Joint.

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATE OF INJURY.	NATURE OF INJURY.	DATE OF OPERATION.	OPERATION AND OPERATOR.	RESULT AND REMARKS.
1	Kelly, J. E., Pt., B, 56th Pennsylvania, age 28.	April 29, 1863.	Conoidal ball fractured upper extremity of left femur.	April 29, 1863.	Single anterior flap, by Surg. E. Shippen, U. S. V.	Gangrene, diarrhœa. Disch'd December 23, 1863. *Spec.* 1148.
2	*Robinson*, Pt., Louisiana regiment, age 35.	Mar. 13, 1863.	Frag. of 24-pounder shell crushing trochanters and neck of left femur and wounding femoral artery.	Mar. 13, 1863.	Antero-internal flap amputat'n, by Surg. W. M. Compton, 2d Texas.	Healed by first intent'n; left hospital April 20, '63, in fine health. EVE (P. F.), *loc. cit.*, pp. 254, 262. *Circ.* 7, S. G. O., 1867, pp. 26, 58.
3	*Williamson*, Pt., 13th Mississippi, age 20.	June 4, 1862.	Conoidal ball fract. right femur, fissures extending into neck quite within capsular ligam't.	June 4. 1862.	Long anterior and short posterior flaps, by Surg. J. T. Gilmore, C. S. A.	Six weeks after operation wound healed and patient allowed to leave hospital. EVE (P. F.), *loc. cit.*, pp. 254, 259. *Circ.* 7, S. G. O., 1867, pp. 24, 57.
4	Alling, J. A., Pt., D, 3d Wisconsin.	Mar. 16, 1865.	Conoidal ball fract'd left femur thro' troch's, with longitud'l splinter'g extend'g down shaft and upw'd within capsul. lig.	Mar. 16, 1865.	Double flap, by Surg. H. Z. Gill, U. S. V.	Died, March 17, 1865, seven hours after operation. *Circ.* 7, S. G. O., 1867, pp. 31, 59.
5	Barger, J., Pt., B, 26th Pennsylvania, age 22.	May 18, 1864.	Fragment of shell shattering right femur from just above tro. minor nine ins. downward.	May 18, 1864.	Single antero-internal flap, by Surg. C. C. Jewett, 16th Mass.	Died, May 18, 1864, two hours after operation. *Spec.* 3080. *Circ.* 7, S. G. O., 1867, pp. 30, 59.
6	Brookins, W., Corp'l, C, 49th Colored Troops.	Sept. 3, 1863.	Musket ball comminut'g upper third left thigh and dividing femoral artery.	Sept. 3, 1863.	Amputation, by Surg. S. Laning, 49th Colored Troops.	Died, Sept. 3, 1863, from hæmorrhage and shock, four hours after operation. *Circ.* 2, S. G. O., 1869, p. 109.
7	Brown, J. M., Pt., H, 63d Indiana.	June 16, 1864.	Conoidal ball shattered upper extremity right femur, fissures extending through trochanter major.	June 17, 1864.	Single anterior flap, by Surg E. Shippen, U. S. V.	Died June 17, 1864; shock of operation. *Circ.* 6, S. G. O., 1865, p. 50. *Circ.* 7, S. G. O., 1867, pp. 31, 59.
8	Bushmil, J., Pt., 99th New York (detailed as a seaman on U. S. frigate Congress).	Mar. 9, 1862.	Piece of shell comminuted neck and trochanters of left femur.	Mar. 9, 1862.	Lateral double flap, method of Baron Larrey, the elder, by Surg. L. McLean, 2d N. Y.	Did not rally; died two hours after operation. *Circ.* 7, S. G. O., 1867, pp. 24, 57.
9	Carlton, R., Captain, I, 3d New Hampshire.	June 16, 1862.	Large missile fractured trochanters and shattered left femur for several inches below.	June 16, 1862.	Anterior posterior flap, by a New England surgeon, assisted by Ass't Surg. F. J. Bancroft, 76th Penn.	Did not rally; died, June 16, 1862, less than two hours after operation.
10	Cook, G., seaman, age 21 ...	Feb. 1, 1864.	Rifle ball fractured left femur, wounded both testes and right thigh.	Feb 2, 1864.	Anterior posterior flap, by Surg A. C. Gorgas, U. S. N.	Never reacted; died two hours after operat'n. *Spec.* 2273. *Circ.* 6, S. G. O., 1865, p. 50. *Circ.* 7, S. G. O., 1867, pp. 28, 58.
11	*Cooper*, ——, Pt., Alabama regiment, age 20.	May 22, 1863.	Fragment of shell comminuted upper third right femur, fracturing tuberosity of ischium.	May 22, 1863.	Large anterior flap, by Surg. W. M. Compton, 2d Texas.	Never rallied; died in less than an hour.
12	Dadds, J. W., Pt., B, 4th Maryland.	May 12, 1864.	Musket ball comminuting left femur at trochanters, involv. hip joint (also fract. left leg).	May 12, 1864.	Double flap, Beclard's method, by Surg. E. G. Chase, 104th New York.	Died, May 12, 1864, twelve hours after operation. *Circ.* 2, S. G. O., 1869, p. 107.
13	Fulton, I. C., Pt., I, 4th New York Heavy Artillery.	Oct. 1, 1864.	Fragment of shell shattered upper extremity of left femur.	Oct. 1, 1864.	Anterior post. flaps, by Surg. J. W. Wishart, 140th Penn.	Died, Oct. 1, 1864, from shock, in a few hours. *Circ.* 2, S. G. O., 1869, p. 108.
14	Gordon, R., Pt., H, 7th Rhode Island, age 28.	May 18, 1864.	Fragment of shell completely shattered left femur.	May 18, 1864.	Method of Guthrie, by Dr. J. M. Carnochan; femoral tied before amputation.	No reaction; died ten hours after operation.
15	Martin, J., Pt., I, 146th New York, age 20.	July 13, 1863.	Conoidal ball comminu'd fracture of left femur a little below trochanter major.	July 14, 1863.	Double flap, by Ass't Surgeon B. Howard, U. S. A.	Shock great; rallied somewhat. Died July 16, 1863. *Spec.* 1379. *Circ.* 6, S. G. O., 1865, p. 50. *Circ.* 7, S. G. O., 1867, pp. 28, 58.
16	Unknown, Union soldier, taken prisoner.	Oct. 21, 1861.	Large missile fractured upper part of femur.	Oct. 21, 1861.	Amputation, by Surgeon H. McGuire, C. S. A.	Died soon after operation; combined shock of injury and oper'n. *Circ.* 2, S. G. O., 1869, p. 108.
17	*Unknown*, Lieut., Arkansas regiment, age 28.	Oct. 3, 1862.	Cannon ball wound of right hip, five inches of the shaft of femur comminuted, head split and exposed.	Oct. 3, 1862.	Soft parts of post. part of thigh pared into shape, large and long antero-internal flap, by Surg W. M. Compton, 2d Tex.	Rallied; favorable progress; Oct. 10th, erysipelas extended rapidly. Died October 12, 1862.
18	*Unknown*, Pt., Maj. Douglass's Cavalry.	Oct. 19. 1862	Round ball and buck comminuted femur just below trochanters.	Oct. 19, 1862.	External posterior flap, antero-internal flap, by Surg. J. F. Grant, P. A. C. S.	Oct. 22d, doing well; last heard from Oct. 30th; probably died. EVE (P. F.), *loc. cit.*, pp. 254, 260. *Circ.* 7, S. G. O., 1867, pp. 25, 58.
19	*Unknown*, Pt., Gen. A. S. Johnston's army.	April 7, 1862.	Frag. shell shatt'd up. extremity left femur, com. extended to head and neck of bone.	April 7, 1862.	Amputation, by Surg. D. W. Yandell, C. S. A.	Died, from exhaust'n, seven h'rs after operation. EVE (P. F.), *loc. cit.*, p. 253. *Circ.* 7, S. G. O., 1867, pp. 24, 57.
20	*Unknown*, Pt., 18th Miss., Barksdale's brigade, age under 30.	July 1, 1862.	Conoidal ball fractured upper extremity of left femur, splintering extending to neck.	July 2, 1862.	Anterior and posterior flaps, by Surg. J. T. Gilmore, C. S. A.	Died, an hour or two after operation, from shock of operation. EVE (P. F.), *loc. cit.*, p. 254. *Circ.* 7, S. G. O., 1867, pp. 25, 57.
21	*Unknown*, Pt., 21st Miss....	July 1, 1862.	Conoidal ball fract'd left femur through trochanters and neck.	July 1, 1862.	Anterior posterior flap, by Surgeon J. T. Gilmore, C. S. A.	Died, July 4, 1862, apparently from shock of operation.
22	*Unknown*, Pt., 3d Missouri.	June —, 1863.	Large frag. of shell comminuting right femur extent of eight inches; femoral artery divided.	Day of injury.	Semi-lunar flap from outer and anterior part, by Surg. B. D. Lay, P. A. C. S.	Reaction never completely established; died same day. EVE (P. F.), *loc. cit.*, pp. 253, 261. *Circ.* 7, S. G. O., 1867, pp. 27, 58
23	*Unknown*, Pt., 27th Tenn....	Aug. 31, 1864.	Cannon shot shat'd right femur, splintering extending to neck.	Aug. 31, 1864.	Antero-posterior flaps, by Surg. J. R. Buist, 1st Tennessee.	Rallied promptly; died, Sept. 2, 1864, thirty-six hours after operation. EVE (P. F.), *loc. cit.*, pp. 253, 258. *Circ.* 7, S. G. O., 1867, pp. 31, 59.
24	Waters, W., Pt., K, 123d New York.	May 15, 1864.	Large fragment of shell carried away left thigh, fracturing right leg.	May 15, 1864.	Amputation of the left hip and right leg, by Surgeon J. W. Brock, 66th Ohio.	Died May 15, 1864. *Circ.* 6, S. G. O., 1865, p. 50. *Circ.* 7, S. G. O., 1867, pp. 29, 58.
25	Wayland, E., Pt., E, 34th Iowa.	July 3, 1863.	Unexploded shrapnel shell almost completely tearing off right thigh at hip joint.	July 3, 1863.	Single large anterior flap, by Surgeon C. W. Davis, 34th Iowa.	Died two hours after operation. *Circ.* 2, S. G. O., 1869, p. 108.

Intermediary Amputations.—Twenty-three instances of amputations at the hip joint during the inflammatory period after shot injury are included in this category, and refer to cases of fifteen Union and eight Confederate soldiers, each case having a fatal result. Brief details of the cases are given in alphabetical order, with foot-note references to the sources of information.[1]

CASE 297.—Private James Carden, of the army of Major General Rosecrans, was wounded at the battle of Chickamauga, in the second day's fight, September 20, 1863, by a fragment of shell, which caused great laceration of the soft parts at the upper part of the thigh, with comminuted fracture of the femur. He was left upon the field and was made a prisoner. On the evening of September 21st, Surgeon R. P. Bateman, C. S. A., amputated his thigh at the hip joint. The patient died on September 27, 1863, six days after the operation.[2]

CASE 298.—Sergeant Lewis Carroll, Co. H, 1st Delaware, aged 23 years, was wounded on October 22, 1864, near the Weldon Railroad.[3] A conoidal musket ball entered the right thigh in front, and, striking the femur at the junction of the upper thirds, produced a remarkable longitudinal splintering of the bone, extending from an inch below the lesser trochanter downward for ten inches, together with several oblique fissures. The wounded man was conveyed in an ambulance to one of the field hospitals of the Fifth Corps, where the ball was extracted and the sharp extremity of the upper fragment of the femur was sawn off. The fractured limb was then dressed, and the patient sent to City Point, and thence on a hospital steamer to Alexandria, where he was admitted to the Third Division Hospital on November 2d. The thigh was swollen to three times the size of its fellow. An incision six inches long on the outer side presented inflamed everted edges, between which fasciculi of muscles protruded. There was much febrile irritation, but the patient's strength was maintained to a remarkable degree. On November 11th, there was quite free hæmorrhage from a small artery, and the patient was etherized and the vessel secured, and afterward a thorough exploration of the wound was made. The very extensive longitudinal splintering was recognized; the bone was found denuded in several places; the soft tissues of the thigh were infiltrated with pus of a very offensive character. In view of this condition of things, it was determined to remove the limb at the hip joint. The patient was placed under the influence of chloroform, and the operation was performed by Surgeon Edwin Bentley, U. S. V. An external flap was made by cutting from without inward; then the head of the femur was disarticulated, and an internal flap was cut from within outward. The loss of blood was slight and the patient reacted promptly. The progress of the case for two or three days after the operation was very favorable. Then a chill occurred, followed by a cold clammy sweat. The wound looked badly and the discharge was unhealthy; the stump was kept covered with yeast poultices. Beef essence, stimulants, and anodynes were administered. Six days after the operation there was yellowness of the surface and of the conjunctival membranes; then delirium and coma, and death on November 19th, eight days from the date of the operation. At the autopsy, pus was found in the external iliac vein, metastatic foci in the lungs, and a gangrenous abscess in the enlarged spleen. The preparation of the femur was sent to the Army Medical Museum, and is figured in the adjacent wood-cut (FIG. 94).

FIG. 94.—Right fem. fissured by a musket ball. *Spec.* 1020.

CASE 299.—Private John Chamberlain, of one of the United States regiments engaged at the battle of Chickamauga, was wounded on September 20, 1863. A conoidal musket ball passed through the upper part of the thigh and produced great comminution of the upper extremity of the femur, the fissures extending to the neck of the bone. The wounded man was left upon the field when the United States forces were driven back and fell into the hands of the enemy. On September 21st he underwent amputation at the hip joint, the operation being performed by Surgeon R. P. Bateman, P. A. C. S. The man survived the operation thirty-six hours, and died September 23, 1863.[4]

CASE 300.—Private Levi Eckley, Co. A, 67th Ohio, was wounded May 20, 1864, in the assault upon the entrenchments near Bermuda Hundred. A conoidal musket ball passed through the left thigh, shattering the upper extremity of the femur and wounding the sciatic nerve. The patient was conveyed on a hospital transport to Fort Monroe, and was admitted to Chesapeake Hospital on May 22d. A consultation was held, at which it was decided that amputation at the hip joint presented the only chance of preserving life. The patient's condition was unfavorable; he was greatly prostrated. On May 24th the operation was performed by Assistant Surgeon H. C. Roberts, U. S. V., by forming antero-posterior flaps by transfixion. The femoral artery was compressed at the groin by Surgeon D. G. Rush, 101st Pennsylvania, and Acting Assistant Surgeons Bayles, Frick, and others aided in the operation. The hæmorrhage was excessive. Though the patient reacted fairly, and partook of nutritious food and stimulants, he died from exhaustion four days after the operation, May 24, 1864.[5]

---

[1] Of the twenty-three intermediary coxo-femoral amputations, details of eighteen were published in *A Report on Amputations at the Hip Joint in Military Surgery*, War Department, S. G. O., July 1, 1867, pp. 32–39 and pp. 61–62, four were noted on pages 107–8, of *A Report on Excisions of the Head of the Femur for Gunshot Injury, Circular* No. 2, War Department, S. G. O., 1869, and one (CASE 308, p. 141, *ultra*, of *Martin*, a soldier of the 26th Confederate Arkansas regiment) was communicated personally by Dr. WILLIAM BLACKWELL WELCH, of Boonsboro', Arkansas, who served three and a half years in the Confederate service. Eleven of the operations were practised by Confederate surgeons,—seven upon their own men and four upon prisoners.—twelve of the operations were by Union surgeons, upon eleven Union and one of the Confederate wounded.

[3] See *Circ.* No. 6, S. G. O., 1865, p. 50, CASE 18, and *Circ.* 7, S. G. O., 1867, CASE XXXVI, pp. 38 and 62, and *Cat. of Surg. Sect.*, of 1866, p. 247.

[4] This case was communicated to Dr. P. F. EVE (*loc. cit.* p. 255) by Dr. R. P. BATEMAN, of Memphis, Tennessee. A request for further details of the case, from the Surgeon General's Office, of May, 1867, received no response.

[5] The data in this case are noted in *Circular* 6, S. G. O., 1865, p. 50, CASE XII, and in *Circular* 7, S. G. O., 1867, at pp. 37 and 62, with additional details from letters by Assistant Surgeon E. MCCLELLAN, U. S. A., and Acting Assistant Surgeon G. BAYLES.

CASE 301.—Private Sullivan Gaines, Co. M, 2d Michigan Cavalry, was wounded on January 31, 1864, near Knoxville, Tennessee, by a conoidal musket ball, which shattered the neck and head of the right femur. On the following day the patient was admitted to hospital No. 4, at Knoxville. He was greatly prostrated, and his constitutional condition was considered unfavorable. On February 3d, Surgeon Edward Shippen, U. S. V., amputated at the hip joint in the presence of Surgeon Henry S. Hewit, U. S. V., and others. The patient being placed under the influence of chloroform, a long double-edged knife was introduced about an inch above the trochanter major; the point was first directed inward and slightly upward so as to divide the capsule freely, and was then depressed and brought out near the tuberosity of the ischium; a large antero-internal flap was then formed, an assistant having passed his hands into the incision and compressed the femoral artery in the flap before it was cut. The flap was now raised, and the heel of the knife was placed at the inner angle of the wound, and a straight incision was made connecting this point with that at which the knife first entered, and dividing the tissues on the back of the thigh down the bone. Disarticulation was then effected. The patient never rallied from the shock of the operation. He died in about one hour.[1]

CASE 302.—*Frank G———*, a private in a Texan regiment, was wounded at the battle of Gettysburg, in the left thigh, by a grapeshot, which entered two inches below the trochanter major, shattered the bone up into the neck, and lacerated the soft parts terribly between the place of entrance and the knee. He remained on the battle-field from the 2d until the 4th day of July, with very little attention, until he was brought to the hospital of the Fifth Corps. After a consultation with a number of surgeons, and the conclusion being in favor of amputation at the hip, the patient was placed upon the table, and, when fully under the influence of chloroform, Surgeon B. Rohrer,[2] 10th Pennsylvania Reserves, performed the antero-posterior operation, assisted by Dr. Joseph A. Philips, and Henry Grimm, Surgeon 12th Pennsylvania Reserves. Surgeon Philips controlled the femoral artery, and not over three ounces of blood were lost. Death followed in thirty-six hours.

CASE 303.—Private Henry H. Hale, Co. G, 14th Illinois, aged 21 years, was wounded at the battle of Shiloh, April 6, 1862. A fragment of shell shattered the upper portion of his left femur so that fissures extended to the neck and far down the shaft. The soft parts on the outer aspect of the thigh were extensively lacerated and contused; the femoral vessels and nerves were uninjured. On April 9th he was placed on the hospital transport steamer Crescent City to be conveyed to St. Louis. On April 12th, Surgeon D. P. Smith, U. S. V., assisted by Surgeons Thomas W. Fry and H. P. Stearns, U. S. V., and Assistant Surgeon M. C. Tolman, 2d Minnesota, performed amputation at the hip joint. The patient being made insensible by chloroform, a long anterior flap was made by transfixion. Surgeon Stearns, following the knife with his fingers, compressed the vessels in the flap and completely controlled the hæmorrhage. The head of the femur was rapidly disarticulated and the soft parts posteriorly were divided by a straight incision. On April 14th the hospital transport steamer arrived at St. Louis, and the wounded were transferred to hospitals in that city. Shortly after Hale's admission to hospital his stump began to look badly, the vast wound suppurated profusely, gangrene supervened, and he sank and died on April 20, 1862.[3]

CASE 304.—Private C. Hamilton, Co. H, 3d U. S. C. T., while employed as a stretcher bearer, in carrying a wounded man from the field, during the assault on Port Hudson, Louisiana, June 14, 1863, was struck by a musket ball, which passed through the upper part of his left thigh. The missile entered behind, near the gluteal fold, and, having fractured the upper part of the femur badly, passed out in front in close proximity to the track of the femoral artery. He was taken to his regimental hospital. The limb was shortened and rotated inward, and great swelling and inflammatory mischief speedily supervened. It was ascertained that fragments of bone were detached and driven into the soft tissues, and there was excessive pain in the limb. It was resolved to make an exploratory incision and to remove the displaced splinters. Chloroform was administered for this purpose, and the patient was then removed to an operating table. While being moved from his bed to the table arterial hæmorrhage of an alarming character took place, and was so copious as to threaten a speedy dissolution. The bleeding was controlled by digital compression of the femoral at the crural arch, and a hasty consultation was held by Surgeon E. P. Gray, 3d U. S. C. T., Surgeon Pierce, U. S. C. T., and Assistant Surgeon George P. Percival, 3d U. S. C. T., and it was determined that amputation at the hip joint afforded the only chance of preserving the man's life. The operation was immediately performed by Surgeon Gray, assisted by his colleagues. He disarticulated the thigh by the antero-posterior flap method, the operation being quickly accomplished without much hæmorrhage. Although the patient was reduced by the irritation and pain caused by his wound, and prostrated by the sudden profuse hæmorrhage, his constitution was robust, and he bore the operation remarkably well. The wound being approximated by sutures and adhesive strips, he was put to bed and carefully nourished and watched. He expressed great gratitude for the operation, declaring that it had entirely relieved him of his excessive suffering. He rallied and appeared, for forty-eight hours after the operation, to be in a very hopeful condition. Then the vital powers seemed to flag. He sank gradually, and died from exhaustion, June 29, 1863, four days after the operation.[4]

CASE 305.—Private *Jackson*, of Colonel Tappan's Brigade, aged 21 years, was wounded at the battle of Belmont, Missouri, November 7, 1861, and was conveyed on a steamer to Memphis and admitted to the Marine Hospital. He had a badly comminuted fracture of the upper extremity of the femur. On November 15th, Dr. Richard Potts proceeded to amputate at the hip joint by antero-posterior flap method. The patient succumbed promptly to the shock of the operation; dying, indeed, before its completion, according to Dr. Mastin, or, according to Dr. Saunders, ten hours after its completion.[5]

[4] The details of the coxo-femoral amputation by Surgeon E. P. GRAY, 3d U. S. C. T., were not received in season for publication in *Circular* 7, S. G. O., 1867, but were printed in *Circular* 2, S. G. O., 1869, p. 109. See also LÜNING (A.), *Über die Blutung bei der Exarticulation des Oberschenkels und deren Vermeidung*, Zurich, 1877, CASE 301, p. 93.

[5] The facts in this case were furnished by Dr. CLAUDE H. MASTIN and Dr. D. D. SAUNDERS, of Memphis. See Professor P. F. EVE'S *Contribution to the History of the Hip Joint Operation performed during the late Civil War*, in *Trans. Am. Med. Assoc.*, 1867, Vol. XVIII, pp. 255 and 264, and *Circular* 7, S. G. O., 1867, pp. 33 and 61, and LÜNING (A.), *Über die Blutung bei der Exarticulation des Oberschenkels*, Zürich, 1877, p. 89, CASE 272.

CASE 306.—Private P. Johnson, Co. C, 2d Delaware, was wounded at the battle of Fredericksburg, December 14, 1862, by a conoidal musket ball, which entered the upper part of the right thigh in front and passed out at the nates, having in its course divided the femoral artery and perforated the great trochanter. Except that the primary hæmorrhage was slight, little is known of the early history of the case. On December 25th the wounded man was conveyed to Washington and placed in the Douglas Hospital. On admission, nearly the entire injured limb was gangrenous, and it was believed that the fracture extended into the hip joint. Surgeon P. Pineo, U. S. V., decided to amputate at the hip joint, "with no hope of a favorable result, but to mitigate patient's distress in the last moments of life." On December 27th, anæsthesia being induced by ether, the operation was performed. The patient survived it only a few hours. The pathological specimen was sent to the Army Medical Museum. It presents an oblique shot perforation through the great trochanter, with radiating fissures which separate the trochanter and neck in four large fragments and run obliquely down the shaft. Traces of the results of periostitis are visible along the outer aspect of the shaft.[1]

FIG. 95.—Shot perforation of trochanter of right femur. *Spec.* 710.

CASE 307.—Private Charles Lackey, Co. E, 7th Wisconsin, aged 30 years, was struck, at Spottsylvania, May 12, 1864, by a conoidal musket ball, which entered in front at the upper part of the right thigh and produced a comminuted fracture of the femur through the trochanters, and extending downward nearly half the length of the shaft of the bone, and then lodged in the muscles at the posterior part of the thigh. After a fatiguing journey to Belle Plain, to which most of the wounded from Spottsylvania were unavoidably subjected, Lackey was conveyed on a hospital steamer to Washington, and was received at Judiciary Square Hospital on May 18th. The wounded limb was much swollen. The sharp extremity of the lower fragment of the femur had lacerated the muscles, and there was profuse suppuration with burrowing of pus throughout the thigh. The fracture was believed to extend into the joint. The patient earnestly demanded that an operation should be performed for his relief. His condition was unpromising, for he was suffering from surgical fever of an intense character. A consultation of surgeons decided, however, that, without operative interference, the case would prove inevitably and speedily fatal; and as the extensive fracture of the shaft of the femur and the purulent infiltration of the thigh precluded excision, amputation at the hip joint was determined on. On May 21st anæsthesia was induced by sulphuric ether, and Assistant Surgeon Alexander Ingram, U. S. A., performed the operation by the antero-posterior flap method. After the operation the patient reacted but partially. After removal to the ward he was plied with beef-tea and stimulants and restoratives; but he continued to sink, and died on the following day, May 22, 1864, twenty hours after the operation.[2]

The details of the next intermediary amputation at the hip (CASE 308) were personally communicated to the Surgeon General's Office by the operator, Dr. W. B. Welch, of Boonsboro', Arkansas, on June 10, 1875, and have not been heretofore published:[3]

CASE 308.—Private *Martin*, of the 26th (Brooks's) Arkansas Regiment, aged 25 years, was wounded at Prairie Grove, December 7, 1862, by a cannon shot, which shattered his left thigh so dreadfully as to leave the limb attached to the trunk only by the soft parts on the anterior aspect. His case had been regarded as hopeless, but after the surgeons had finished all the other operations he was observed to have rallied somewhat, though greatly exsanguined and prostrated. With the assistance of Drs. Duvall and Keller, Surgeon W. B. Welch, P. A. C. S., of Gunter's Arkansas Regiment, performed exarticulation, making a large anterior flap. The operation was performed twenty-four hours after the injury, and the patient survived four days, when he succumbed from exhaustion.

CASE 309.—Private Joseph Minott, Co. A, 4th Vermont, was wounded early on June 23, 1864. Minott had his right femur fractured in the upper portion of the shaft by a conoidal musket ball, and lay where he fell, beyond the reach of succor. On the morning of the third day, June 25th, having been without food or drink for forty-eight hours, he crawled into our lines, a distance of over half a mile. He was carried to the field hospital of the 2d division of the Sixth Corps, greatly exhausted. After he had received nourishment and cordials his injuries were examined, and it was found that, besides the extensive comminution of the femur, rapidly spreading gangrene had supervened. In front, mortification already extended to within a few inches of Poupart's ligament. A consultation of the surgeons of the division decided that coxo-femoral amputation offered the only chance of recovery, and that the operation could not be delayed. On the afternoon of June 25th, therefore, the patient was rendered insensible by chloroform, and the amputation was performed by Surgeon D. A. Goodwin. But little blood was lost, yet the patient soon began to sink, and expired on June 25, 1864.[4]

---

[1] See *Circular* 6, S. G. O., 1865, p. 50, CASE 10; *Catalogue of the Surg. Sect. of the Army Medical Museum*, 4to, 1866, p. 248; *Circular* 7, S. G. O., 1867, pp. 35 and 62.

[2] The abstract of this case is compiled from register and Report of Surgical Operations of the Judiciary Square Hospital, Washington. The case is noted at p. 50 of *Circular* 6, S. G. O., 1865, as CASE 11. The age is correctly stated at "19" years, while in *Circular* No. 7, S. G. O, 1867, pp. 37, 62, by a clerical inadvertence the age is given at "30" years. See also LÜNING (A.), *Ueber die Blutung bei der Exarticulation des Oberschenkels*, Zürich, 1877, *Fall* 328, S. 97.

[3] After the publication of *Circular* 7, S. G. O. (*A Report on Amputations at the Hip Joint in Military Surgery*, Washington, 1867, 4to, p. 88), Dr. JAMES M. KELLER, of Kentucky, Vice President of the American Medical Association, in 1874, informed the compiler of that report that of several excisions or amputations at the hip that he had observed during his service in the Confederate Army, one was a coxo-femoral amputation practised by Dr. WELCH, after the battle of Prairie Grove, December 7, 1862; and that he had notes of this and of several other amputations and excisions at the hip, which "in the conflagration caused by the explosion in the ordnance depot, at Mobile, Alabama, just after the surrender (April 9, 1865), with notes on field and hospital Surgery, were destroyed." In the absence of any particulars, it was impossible to classify this case of amputation at the hip; but years subsequently, June 10, 1876, Dr. WILLIAM BLACKWELL WELCH called at the Army Medical Museum with Colonel THOMAS MONTICUE GUNTER, M. C. of the IVth Arkansas district, and formerly colonel of the 13th Arkansas regiment, and furnished the details of the case above cited.

[4] Surgeon S. J. ALLEN, 4th Vermont, and the operator, Surgeon DAVID M. GOODWIN, reported this case. See *Circular* No. 7, S. G. O., 1867, pp. 38, 62, and LÜNING (A.) (*op. cit.*, Zürich, 1877, p. 97, CASE 330).

CASE 310.—Private Peter Pausbeck, Co. K, 43d Illinois, was admitted on April 20, 1862, from the battle-field of Shiloh, to hospital No. 2, at Evansville. He had been wounded on April 7th, probably by a conoidal musket ball. The projectile had entered the front of the left thigh, about an inch below the level of the trochanter major, and ranging a little upward had emerged from the gluteal region opposite. The upper portion of the femur was crushed and the injury to the soft parts was most extensive. A consultation was held on April 21st, and the opinion that amputation at the hip afforded the only possible chance of preserving life was unanimous. Dr. DeBruler operated, assisted by Dr. T. N. Myers and others. The loss of blood was very trifling. After the completion of the operation, the pulse, which had been carefully watched, was observed to fail rapidly. Unavailing attempts were made to give brandy and other restoratives. In a few moments the man was dead. There was no reason to believe that the use of chloroform had any connection with the fatal result, which was apparently due solely to the shock of the operation. Such was the opinion of the eminent professor of surgery of Jefferson College, Dr. S. D. Gross, who happened to visit the hospital half an hour after the operation. Professor Gross expressed his approbation of the course that had been adopted, since, although it had resulted unfortunately, it afforded the only hope of saving the patient's life.[1]

FIG. 96.—Longitudinal fissuring of right femur. *Spec.* 4237.

CASE 311.—Private George M. Spencer, Co. B, 2d New York Mounted Rifles, aged 17 years, was wounded on March 31, 1865, at Dinwiddie Court House, Virginia, by a conoidal musket ball, which entered the right gluteal region, and striking the great trochanter, produced a fracture through the trochanters, with very remarkable longitudinal splintering, extending nine inches down the shaft (FIG. 96). The projectile then lodged. The wounded man was sent to City Point, and thence by steamer to Washington, and entered Judiciary Square Hospital on April 4th. There was already a good deal of inflammatory swelling and suppuration, but the constitutional condition was encouraging. Upon examination of the wound, it was thought that the fracture did not extend below the trochanter and that the joint was probably involved, and it was determined to excise the head of the femur. The patient having stated that he was anxious to avail of the benefit of any operation that was deemed necessary, he was placed under the influence of chloroform on April 12th, and Surgeon Elisha Griswold, U. S. V., proceeded to disarticulate the head of the femur through a long vertical incision on the outside of the thigh, and to remove the head with an obliquely fractured fragment of the shaft attached to it. The splintering of the shaft was now discovered, and after a hasty consultation with the surgical staff it was decided that amputation at the hip joint was the only procedure which afforded the patient any prospect of recovery. This operation was rapidly executed by Surgeon Griswold, aided by Acting Assistant Surgeons Hill, McCalla, Colton, and Ahern, by the double-flap method. There was but little hæmorrhage; but the shock of the operation was too great. The usual means to promote reaction were diligently employed, but the patient never rallied, and survived the operation less than an hour.[2]

CASE 312.—A private of Co. C, 54th Massachusetts, a colored man, was wounded and made a prisoner in the assault on Morris Island on July 11, 1863. A fragment of a shell from Fort Wagner struck the upper and outer part of his right thigh, and fractured the neck and head of the femur and the rim of the acetabulum, and extensively lacerated the soft parts in its exit through the posterior part of the thigh. The patient was conveyed to Charleston on the afternoon of July 12th, and was placed in a hospital hastily prepared for the reception of wounded colored prisoners. The contract surgeon in charge of the hospital reports that the patient's condition, in view of the terrible wound he had suffered, was remarkably good, and that the symptoms of shock were unusually slight. On July 13th, the third day after the reception of the injury, Surgeon R. A. Kinloch, P. A. C. S., saw the case, and amputated at the hip joint by Manec's method. The knife being entered midway between the anterior superior spinous process of the ilium and the great trochanter, and carried downward and inward until its point emerged just in front of the ischium, was made to form a large antero-internal flap; the soft parts on the outer and posterior part of the thigh were then divided by a semicircular incision from without inward, and the head of the femur was then disarticulated. The patient bore the operation well, but a few hours subsequently there was extreme depression, and the case terminated fatally on the following morning, July 14th, twenty hours after the operation.[3]

FIG. 97.—Comminuted shot fracture of femur. From a drawing furnished by Dr. BLACKMAN.

CASE 313.—A private soldier of an Ohio regiment, aged 35 years, was wounded at the battle of Shiloh, April 6, 1862, by a fragment of shell, which extensively comminuted the shaft, trochanters, and neck of the right femur, as illustrated in the accompanying wood-cut (FIG. 97). The patient was left on the battle-field during the tempestuous night of April 6th, and until late on the following day. He was then removed to a temporary hospital, and thence to the steamer Lancaster, to be transported to Cincinnati. On April 16th, it was decided to remove the limb, and the patient being rendered insensible by chloroform, amputation at the hip joint was performed by Surgeon G. C. Blackman, U. S. V., by the antero-posterior flap. On April 18th, the patient was transferred to St. John's Hospital, Cincinnati, and Dr. C. D. Palmer reported that the flaps began to slough. Death ensued on April 22, 1862.[4]

---

[1] Dr. J. P. DEBRULER, of Evansville, Indiana, communicated the particulars of this case. See *Circular* No. 7, S. G. O., 1867, pp. 34 and 61, and LÜNING (A.), *Über die Blutung bei der Exarticulation des Oberschenkels*, Zürich, 1877, S. 91, F. 290.

[2] This case was first published in *Circular* No. 6, 1865, p. 50, CASE 21, from the Judiciary Square Hospital Surgical Report for the second quarter of 1865. See *Catalogue of the Surgical Section of the Army Medical Museum*, 4to, 1866, p. 248, and *Circular* No. 7, S. G. O., 1867, pp. 39 and 62, with reference to the report of a board of inquiry in the case, convened April 13, 1865, consisting of Surgeon O. A. JUDSON, U. S. V., Assistant Surgeon W. THOMSON, U. S. A., and Assistant Surgeon W. F. NORRIS, U. S. A. See also LÜNING (A.) (*loc. cit.*, Zürich, 1877, p. 102, CASE 366).

[3] The particulars of this case were communicated to the Surgeon General's Office by Professor R. A. KINLOCK, of Charleston. See EVE (P. F.) (*loc. cit.*, Vol. XVIII, p. 255, CASE 17, and *Circular* No. 7, S. G. O., 1867, pp. 36 and 62, and LÜNING (A.), *op. cit.*, Zürich, 1877, p. 94, CASE 307.

[4] BLACKMAN (G. C.), *Amputation at the Hip joint*, in *Cincinnati Jour. of Medicine*, 1866, Vol. I, p. 101. *Circular* No. 6, S. G. O., 1865, p. 50. *Circular* No. 7, S. G. O., 1867, pp. 34, 61. LÜNING (A.), *Über die Blutung bei der Exarticulation des Oberschenkels*, Zürich, 1877, p. 91, CASE 289.

CASE 314.—A private soldier of the U. S. Army was wounded at the first battle of Bull Run, July 21, 1861, by a musket ball, which fractured the lower third of right femur. He fell into the hands of the enemy, and, on the following day, was conveyed in an army wagon to Manassas Junction, and thence by rail to Richmond, where he was admitted to the Alms House Hospital. One week after the reception of the injury there was extensive purulent infiltration in the muscles of the thigh and incipient gangrene of the leg. Under these circumstances Drs. St. George Peachy and Charles Bell Gibson decided to amputate at the hip joint. On July 29th the operation was performed by Dr. Peachy, in the presence of Drs. Gibson, A. E. Peticolas, Richardson, and others. A preliminary ligature was placed upon the femoral artery at the beginning of the operation, which was probably done according to Larrey's method. The patient is believed to have survived the operation two or three days.[1]

CASE 315.—A private of General Bragg's army, whose name and military description are not recorded, a large man, six feet high, of fair complexion, about 26 years of age, was wounded on December 28, 1862, in a skirmish prior to the battle of Murfreesboro'. A conoidal musket ball produced a fracture of the trochanter major and neck of the femur, with fissures extending within the capsular ligament. The wounded man was placed in a field hospital, and his injured limb was supported in a proper position; but the local inflammation and constitutional disturbance that ensued were intense, and, on January 5, 1863, it was determined to amputate at the hip joint. The patient being placed under chloroform, the operation was performed by the antero-posterior flap method by Assistant Surgeon A. C. Crymes, 39th Alabama. On being removed to his bed the patient manifested extreme prostration, and stimulants were freely administered. After a few hours he was able to take nutriment in a concentrated form, and a supporting and stimulating treatment was perseveringly pursued. In a very few hours after the operation, however, the stump evinced a tendency to unhealthy action, and the patient sank into an adynamic condition, and died on the morning of January 8th, three days after the operation.[2]

CASE 316.—A private of Colonel Dockeray's Arkansas Regiment of Cabell's Brigade was wounded at the battle of Corinth, Mississippi, October 3, 1862, by a conoidal musket ball, which shattered the neck of the right femur. He was conveyed to a hospital at Iuka, where, on November 3d, his thigh was amputated at the hip joint by his regimental surgeon, Dr. R. A. Felton. The patient died upon the table before the dressing of the stump was completed. The operation was done under chloroform, and it was the general impression of the surgeons present that the anæsthetic was administered too freely.[3]

CASE 317.—Besides the instance of primary coxo-femoral amputation for shot injury by Dr. B. D. Lay, P. A. C. S., detailed as CASE 284, p. 135, *ante*, were two intermediary amputations at the hip joint for comminution of the upper portion of the femur by conoidal musket balls, performed by the same surgeon. One of them, here to be noted, was that of a Confederate private soldier, who suffered a shot fracture of the femur, in Mississippi, early in 1863, prior to the siege of Vicksburg. Comminution of the femur extended high up through the trochanteric region, and amputation at the hip was practised two days after the injury. The patient sank under the shock of the injury and operation a few hours after the latter,[3] although the operation was completed rapidly and with slight loss of blood. Dr. Lay observed that "nothing in this case served to diminish the terror with which I approach such cases."[4]

CASE 318.—A private Confederate soldier, whose name and military description are not identified, received a shot comminution of the femur in one of the engagements in Mississippi, in the early part of 1863, prior to the siege of Vicksburg. A day or two after the injury, amputation at the hip was performed by Dr. B. D. Lay, P. A. C. S. Although the amputation was rapidly accomplished, with little loss of blood, the patient sank and died a few hours after the operation. The detailed memoranda of this and the preceding case were unfortunately lost.[5]

CASE 319.—Private *J. H. Wolf*, Co. D, 4th Virginia, had his femur fractured at the battle of Bull Run, July 21, 1861, by a musket ball, which traversed the upper part of the thigh in an antero-posterior direction, and striking the femur four inches below the trochanters, shattered it quite up to the neck. The patient was removed to Charlottesville, and was received in the general hospital at that place on July 24th. The fracture was treated by Smith's anterior suspensory splint, and this mode of dressing proved very serviceable for a time. The inflammatory phenomena did not abate, however, and after four weeks it was decided that removal of the limb at the coxo-femoral articulation alone afforded a hope of preserving the patient's life. On August 21st the operation was performed by Brigadier General Edward Warren, Surgeon General of North Carolina, and was rapidly executed by the double flap method, with inconsiderable hæmorrhage. On the following day there was slight hæmorrhage. Death from exhaustion ensued on August 23, 1861, thirty hours after the operation. The constitutional condition of the patient was unfavorable, and he was suffering from colliquative diarrhœa.[6]

---

[1] The particulars of this case were supplied by Professor T. G. RICHARDSON, of New Orleans, who was present at the operation. See also *Circular* No. 7, S. G. O., 1867, CASE XX, pp. 33, 61, and LÜNING (A.), *Über die Blutung*, u. s. w., Zürich, 1877, p. 89, CASE 270.

[2] Details of this case were communicated to the Surgeon General's Office by the operator, Assistant Surgeon A. C. CRYMES, 39th Alabama, and by Professor R. A. KINLOCH, of Charleston, South Carolina. The case has been published in Professor P. F. EVE'S contribution (*op. cit.*, *Trans. Am. Med. Assoc.*, 1867, Vol. XVIII, p. 255, CASE 20). See also *Circ.* 7, S. G. O., 1867, pp. 35, 62, and LÜNING (A.), *loc. cit.*, Zürich, 1877, p. 92, CASE 293).

[3] This case was first published by Professor P. F. EVE (*Transact. Am. Med. Assoc.*, 1867, Vol. XVIII, pp. 253, 261). Further particulars of the case were communicated by Surgeon JAMES D. WALLACE, 1st Missouri. The operator, Surgeon R. A. FELTON, died in 1863. See *Circular* No. 7, S. G. O., 1867, pp. 35, 62. See also Dr. AUGUST LÜNING (*op. cit.*, Zürich, 1877, S. 92, CASE 291).

[4] Dr. B. D. LAY, of Paducah, Kentucky, in a letter of July 26, 1867, to the Surgeon General's Office, refers to this case, and Dr. L. D. NIDELET, of Mobile, Alabama, in letters of April 21 and May 4, 1867, mentions having assisted at the operation.

[5] In a letter to the Surgeon General's Office, dated Paducah, Kentucky, July 25, 1867, Dr. B. D. LAY regrets his inability to furnish more details respecting this and the preceding case of intermediary amputation at the hip joint, and states that he had kept copious notes of all of his cases of amputations practised during the war, and that these notes, with records and instruments of the Vicksburg hospitals and its branches, were given in charge to Surgeon J. H. BOUCHER, of Major-General J. B. MCPHERSON'S corps; and, if the registers were preserved, they would give the desired information. It was ascertained that Dr. J. H. BOUCHER, formerly Surgeon 13th Iowa, afterwards Surgeon U. S. V., and Medical Director of the Seventeenth Corps, resided in Iowa City after the war, and died in April, 1874. His son, Dr. F. H. BOUCHER, of Clarksville, Iowa, July 15, 1878, made a careful examination in his father's library for papers and notes pertaining to the surgery of the war without finding any trace of the memoranda referred to by Dr. B. D. LAY.

[6] EVE (P. F.), *loc. cit.*, p. 254. *Circular* No. 7, S. G. O., 1867, pp. 33, 61. FAUNTLEROY (A. M.), *Hip Joint Amputations*, in *Richmond Med. Jour.*, 1866, Vol. I, p. 11. LÜNING (A.), *Über die Blutung bei der Exarticulation des Oberschenkels*, Zürich, 1877, p. 89, CASE 271.

Of the twenty-three intermediary amputations at the hip joint, ten were on the right side, six on the left; in seven cases the side of injury was not stated. The Museum possesses pathological specimens from three of the twenty-three cases.

TABLE XVI.

Summary of Twenty-three Cases of Intermediary Amputation at the Hip Joint.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
1	Carden, J., Pt., Gen. Rosencrans's army.	Sept. 20, 1863.	Fragment of shell comminuted femur, ex. lac. of soft parts.	Sept. 21, 1863.	Amputation, by Surg. R. P. Bateman, P. A. C. S.	Died September 27, 1863.
2	Carroll, L., Sergeant, H, 1st Delaware, age 23.	Oct. 22, 1864.	Conoidal ball, r't femur splintered, extending ten ins.; ball ext.; sharp upper extremity of femur sawn off; Nov. 2, hæm., lig. small artery.	Nov. 11, 1864.	External flap made by cutting from without inward, internal flap by cutting from within outward, by Surg. E. Bentley, U. S. V.	Progress favorable for three days; Nov. 17th, pyæmio symptoms. Died Nov. 19, 1864, pyæmia. Autopsy. *Spec.* 1020. *Circ.* 6, S. G. O., 1865, p. 50. *Circ.* 7, S. G. O., 1867, pp. 38, 62.
3	Chamberlain, J., Pt., U. S. Army.	Sept. 20, 1863.	Conoidal ball, great com. upper extremity of femur, fissures extending to neck.	Sept. 21, 1863.	Amputation, by Surg. R. P. Bateman, P. A. C. S.	Died thirty-six hours after oper'n. EVE (P. F.), *loc. cit.*, p. 255. *Circ.* 7, S. G. O., 1867, pp. 36, 62.
4	Eckley, L., Pt., A, 67th Ohio, age 33.	May 20, 1864.	Conoidal ball shattering upper extremity of left femur and wounded sciatic nerve.	May 24, 1864.	Antero-posterior flap, by Ass't Surg. H. C. Roberts, U. S. V., and others.	Reacted fairly. Died, May 28, 1864, from exhaustion. *Circ.* 6, S. G. O., 1865, p. 50. *Circ.* 7, S. G. O., 1867, pp. 37, 62.
5	Gaines, S., Pt., M, 2d Michigan Cavalry.	Jan. 31, 1864.	Conoidal ball shattered head and neck of right femur.	Feb. 3, 1864.	Large antero-internal flap, by Surg. E. Shippen, U. S. V.	Never rallied. Died one hour after operation, from shock.
6	*G*——, F., Pt., Texas regiment.	July 2, 1863.	Grapeshot shatt'ring left femur at trochanter major up into the neck.	July 4, 1863.	Antero-posterior flap, by Surg. B. Rohrer, 10th Penn. Res., and others.	Died thirty-six hours after operation.
7	Hale, H. H., Pt., G, 14th Illinois, age 21.	April 6, 1862.	Frag. of shell shattered upper portion of the left femur, soft parts ex. lacerated.	April 12, 1862.	Long anterior flap, by Surg. D. P. Smith, U. S. V., and others.	Reaction fair; April 14th, gangrene. Died April 20, 1862.
8	Hamilton, C., Pt., H, 3d Colored Troops.	June 14, 1863.	Musket ball fract. upper part of left femur—great swelling, inflammation, and pain—copious hæm., digital pressure.	June 25, 1863.	Antero-posterior flap, by Surg. E. P. Gray, 3d Col'd Troops, and others.	Sank gradually, and died, June 29, 1863, from exhaustion. *Circ.* 2, S. G. O., 1869, p. 109.
9	*Jackson*, —, Pt., Col. Tappan's brigade, age 21.	Nov. 7, 1861.	Shot comminuted fracture of upper extremity of femur.	Nov. 15, 1861.	Antero-posterior flap, by Surg. R. Potts, P. A. C. S.	Succumbed to shock of operation. EVE (P. F.), *loc. cit.*, pp. 255, 264. *Circ.* 7, S. G. O., 1867, pp. 33, 61.
10	Johnson, P., Pt., C, 2d Delaware.	Dec. 14, 1862.	Conoidal ball perforating right great trochanter; gangrene eatire limb.	Dec. 27, 1862.	Amputation, by Surgeon P. Pineo, U. S. V.	Died a few hours after operation. *Spec.* 710. *Circ.* 6, S. G. O., 1865, p. 50. *Circ.* 7, S. G. O., 1867, pp. 35, 62.
11	Lackey, C., Pt., E, 7th Wisconsin, age 30.	May 12, 1864.	Conoidal ball frac. right femur, thro' trochanters, nearly half length of shaft; surgical fev.	May 21, 1864.	Antero-posterior flap, by Ass't Surg. A. Ingram, U. S. A.	But partial reacti'n. Died twenty-four hours after operation. *Circ.* 6, S. G. O., 1865, p. 50. *Circ.* 7, S. G. O., 1867, pp. 37, 62.
12	*Martin*, —, Pt., 26th Arkansas, age 25.	Dec. 7, 1862.	Cannon shot shattering the left thigh.	Dec. 8, 1862.	Large anterior flap, by Surg. W. B. Welch, of Col. Gunther's Arkansas regiment.	Rallied somewhat. Died, Dec. 12, 1862, from exhaustion.
13	Minott, J., Pt., A, 4th Vermont, age 20.	June 23, 1864.	Conoidal ball fract. upper portion shaft right femur; gangrene, mortification.	June 25, 1864.	Short anterior, long posterior flap, by Surg. D.M. Goodwin, 3d Vermont.	Rallied, but soon began to fail; died two hours after operation. *Circ.* 7, S. G. O., 1867, pp. 38, 62.
14	Pausbeck, P., Pt., K, 43d Illinois.	April 7, 1862.	Conoidal ball crushing upper portion left femur, extensive injury of soft parts.	April 21, 1862.	External and internal flap, after Lisfranc's method, by A. A. Surg. J. P. Do Bruler.	Died, a few moments after operation, from shock. *Circ.* 7, S. G. O., 1867, pp. 34, 61.
15	Spencer, G. M., Pt., B, 2d New York Mounted Rifles, age 17.	Mar. 31, 1865.	Conoidal ball fract. thro' right trochan's, splintering extending nine ins.; lodged.	April 12, 1865.	Incision for excision, double flap amp., by Surg. E. Griswold, U. S. V., and others.	Died in less than an hour. *Spec.* 4237. *Circ.* 6, S. G. O., 1865, p. 50. *Circ.* 7, S. G. O., 1867, pp. 39, 62.
16	Unknown, Pt., C, 54th Massachusetts.	July 11, 1863.	Fragment of shell fract. neck and head of right femur and rim of acetabulum.	July 13, 1863.	Manec's method, large antero-internal flap, by Surg. R. A. Kinloch, P. A. C. S.	Died twenty-four hours after operation. EVE (P. F.), *loc. cit.*, p. 255. *Circ.* 7, S. G. O., 1867, pp. 36, 62.
17	Unknown, Pt., Ohio regiment, age 35.	April 6, 1862.	Frag. of shell comminuted shaft, trochanters, and neck of right femur.	April 16, 1862.	Antero-posterior flap, by Surg. G. C. Blackman, U. S. V.	Rallied satisfactorily; April 18th, flaps sloughed badly; pyæmic symptoms. Died April 22, 1862.
18	Unknown, Pt., U. S. Army.	July 21, 1861.	Musket ball fract. lower third right femur; ex. pur. infiltration; incipient gang. of leg.	July 29, 1861.	Probably by Larrey's method, by Surg. St. G. Peachy, P. A. C. S.	Survived oper'n two or three days. EVE (P. F.), *loc. cit.*, p. 253. *Circ.* 7, S. G. O., 1867, pp. 33, 61.
19	*Unknown*, Pt., Gen. Bragg's army, age 26.	Dec. 28, 1862.	Conoidal ball fract. troch. maj. and neck of femur, fissures extending into capsular lig.	Jan. 5, 1863.	Antero-posterior flap, by Ass't Surgeon A. C. Crymes, 39th Alabama.	In a few hours stump evinced a tendency to unhealthy action, and patient sank into adynamic condition; died Jan. 8, 1863. EVE (P.F.), *loc. cit.*, p. 255. *Circ.* 7, S. G. O., 1867, pp. 35, 62.
20	*Unknown*, Pt., Col. Dockeray's Arkansas regiment.	Oct. 3, 1862.	Conoidal ball shattering neck of right femur.	Nov. 3, 1862.	Amputation, by Surg. R. A. Felton, of Col. Dockeray's regiment.	Died before dressing of stump was completed. EVE (P. F.), *loc. cit.*, pp. 253, 261. *Circ.* 7, S. G. O., 1867, pp. 35, 62.

Secondary Amputations.—Of nine instances of secondary amputations at the hip joint, eight were practised on Union soldiers and one on a Confederate soldier, resulting in two recoveries and seven deaths, a mortality rate of 77.7 per cent. The shortest interval between the reception of the injury and the operation was forty-three days; the longest, two years nine months and twenty-one days. Six of the operations were performed on the right side and three on the left. Of the two survivors of secondary amputation at the hip, one is a pensioner in comfortable health at a period nearly fifteen years after the operation.

CASE 320.—Private George W. Lemon, Co. C, 6th Maryland, aged 30 years, had his left femur fractured, at the junction of the middle and upper thirds, by a conoidal musket ball, at the battle of the Wilderness, May 5, 1864. He was left in a shelter tent on the field and fell into the hands of the enemy. On May 13th he was recaptured, and was sent to Fredericksburg, and thence to Alexandria, where he was received at the Third Division Hospital on June 14th. When admitted he had diarrhœa and was greatly emaciated. There was a bed-sore, four inches in diameter, over the sacrum, and smaller sores over the prominences on the spine and scapulæ. The lower end of the upper fragment of the femur protruded from the wound, from which there was a profuse offensive ash-colored discharge. To check the diarrhœa, to administer suitable nourishment, and to take pressure from the bed-sores by supporting the body on air cushions, were the first matters attended to. Then moderate extension was applied to the injured limb, and a tolerably good position was maintained by means of pillows and cushions. In three weeks the bed-sores were healed, and there was a slight improvement in the general constitutional condition. Extension of the limb causing pain, it was discontinued. For the next ten or twelve months the patient clung to life by the slenderest thread. Detached fragments of bone frequently gave rise to inflammatory swelling, abscesses in the thigh, and profuse suppuration. Yet the appetite and digestion continued to be good, and the great drain upon the system was supported unusually well. In May, 1865, it was found that the fracture was quite firmly consolidated. The patient now occasionally sat up in a chair, but every attempt of the sort was followed by acute inflammation of the thigh, with increased suppuration. It was now decided that the patient must ultimately sink under the profuse suppuration, and that an operation should be performed as soon as it was opportune, and that every effort should be made to put the patient in a condition to support this shock. On October 12, 1865, Surgeon Edwin Bentley, U. S. V., proceeded to amputate at the hip joint. Chloroform was administered; the external iliac artery was compressed at the pubis; anterior and posterior semilunar flaps were formed by transfixion, and the femur was disarticulated. The hæmorrhage was inconsiderable, and the patient reacted soon and satisfactorily. From the day of the operation he steadily improved, with scarcely an untoward symptom. On November 15th, Dr. Bentley reported that the ligatures had all come away, and that the wound was granulating kindly. In December the stump was healed, and the patient began to get about on crutches. The fracture of the exarticulated femur was found to be imperfectly but quite firmly united, with great antero-posterior angular deformity and shortening. The bone was sent to the Army Medical Museum, where it is preserved as *Specimen* 4386. A posterior view of it is given by the annexed left hand wood-cut (FIG. 98). On January 31, 1866, a photograph of the man was taken, from which the right hand wood-cut (FIG. 99) is copied. Lemon was then transferred to the Harewood Hospital, at Washington. He was then quite well, and able to go where he chose on crutches. The cicatrix was firm and healthy. On February 3, 1866, he was discharged from the hospital, and from the service of the United States, at his own request. He went to his home at Bird Hill, Carroll county, Maryland, and resumed his trade of shoemaking. He was granted a pension of fifteen dollars a month. On April 23, 1867, a letter was received from him in which he stated that his health was excellent; that he weighed ninety-nine and a half pounds, an increase of twelve and a half pounds from the date at which he left the hospital; and that he had been able to walk to the village of Westminster, a distance of seven miles, without fatigue. In a letter dated Westminster, Maryland, July 31, 1870, he states "that the artificial limb is not now or ever has been of the least service to me. * * I have tried to wear it; but it only serves to irritate the stump, and makes it so raw and sore that I cannot bear it to touch anything for days afterwards." The pensioner was paid June 4, 1878.[1]

FIG. 98.—Consolidated gunshot fracture of the left femur. *Spec.* 4386.

FIG. 99.—Appearance of cicatrix after secondary coxo-femoral amputation. [From a photograph.]

[1] This secondary amputation at the hip is noted on page 52 of *Circular* No. 6, S. G. O., 1865, in a foot-note. In the *Catalogue of the Surgical Section of the Army Medical Museum*, of 1866, p. 248, there is a brief memorandum of the facts of the case, with a wood-cut of the fractured femur, contributed to the Museum by the operator, Surgeon EDWIN BENTLEY, U. S. V. A detailed account of the case, compiled from the reports of the Third Division Hospital, Alexandria, and Harewood Hospital, Washington, is printed in *Circular* No. 7, S. G. O., 1867, p. 42.

The subject of the second successful secondary amputation at the hip was in good health four and a half years subsequent to the operation, but has not replied to letters of inquiry of a later date.

CASE 321.—Private *Woodford W. Longmoor*, a rebel soldier, aged 25 years, a robust, healthy man, was wounded at a skirmish at Cynthiana, Kentucky, on June 11, 1864. A ball from a Belgian rifle, at short range, passed through his right thigh, shattering the shaft of the femur. There was profuse hæmorrhage and the shock was alarming. He remained almost insensible for three or four days, and for a fortnight there was extreme prostration. He was placed in a rebel field hospital, and the injured limb was put in a fracture box, with which was connected a crutch piece extending to the axilla. On the evening of the reception of the wound numerous detached bony splinters, a handful almost, were extracted. For six weeks extension and counter-extension were maintained, but so much suffering arose from this treatment that it was discontinued, and the limb was simply supported in a comfortable position. The patient was confined to his bed for eight and a half months. In the middle of March, 1865, he was removed to Florence, Kentucky, seven miles from Cincinnati, and Dr. George C. Blackman, professor of surgery in the Medical College of Ohio, was consulted in the case. There was a profuse discharge of offensive pus, and the patient's strength seemed to be failing under the protracted irritation and spoliation. There had been frequent recurrences of abscesses in the thigh, attended with excessive pain and swelling, and followed by the elimination of fragments of necrosed bone. Ever since the reception of his injury the patient had taken morphia very freely. Evidently there were still loose sequestra and diseased bone with which sinuses communicated, and Dr. Blackman proposed to remove these sources of irritation. On April 23d the patient consented to an operation, and a number of necrosed fragments were extracted, with much relief to the local irritation and benefit to the general health. During the autumn, however, evidences of extensive destructive inflammation of the shaft of the femur became unmistakable, and in December a second operation for the removal of fragments was performed without advantage. The discharge became more offensive and sanious, and the strength of the patient rapidly gave way. In January, 1866, his condition became almost hopeless, and the removal of the diseased limb was determined on. The operation was performed on January 18th. Ether was administered, and the lower extremities were kept elevated for a few minutes before the incisions were made. Then the right femoral was compressed at the groin, and the disarticulation was rapidly effected by Lacauchie's method.[1] A circular cut through the skin was made at the junction of the upper third of the thigh; then the integuments were retracted and the muscles were divided circularly down to the bone. A vertical incision was now made on the outer side of the limb, commencing a little above the trochanter and joining the first incision. The head of the bone was then exarticulated. There was but little hæmorrhage, and the patient rallied from the operation remarkably well. The following day he suffered greatly from nausea, which he ascribed to the use of the ether. This distressing complication soon subsided, however, and thenceforward there was no unpleasant symptom, and the patient progressed rapidly toward recovery (FIG. 100). In February, 1867, Longmoor reported himself to Dr. Blackman as in excellent health, and as having recently married. In the latter part of June, 1867, seventeen months after the operation, Dr. Blackman again saw him, and found that his general health was good, and that his stump was sound, though subject to occasional attacks of neuralgia of extreme severity. He was accustomed, in these attacks, to alleviate his suffering by taking large doses of morphia. An examination of the limb after its removal showed that the entire shaft of the femur had been affected by osteomyelitis. The specimen, with its delicately encased sequestra and fragile deposits of new bone, was destroyed by an unskilful preparer. On July 21, 1870, a letter of inquiry was addressed by the reporter to Mr. Longmoor, then at Cynthiana, Kentucky, which elicited the following response: "In answer to your inquiry, 'have you suffered much from neuralgic pains,' I answer there existed, for a long time, contractions of the muscles, in the centre of the stump, attended with considerable pain and tenderness; the interval between those contractions of the muscles and the pain is much lengthened. I now suffer comparatively little, and my general health is much improved."[2]

FIG. 100.—Cicatrix five months after secondary amputation at the hip. [From a drawing by Prof. BLACKMAN.]

In the seven fatal cases of secondary amputations at the hip joint the injuries were inflicted by small projectiles. One patient survived the operation nearly four months; one, twenty-three days; one, eleven days; one, three days; and three, one day or less.

[1] M. A. E. LACAUCHIE, chirurgien principal, and chief medical officer of the French army of occupation in Rome, gives a description, with illustrations, of his procedure for amputating at the hip joint, in the *Gazette Médicale de Paris*, Nos. 19, 20, 25, and 26, 1850.

[2] The particulars of this case of secondary amputation at the hip joint were contributed to the Surgeon General's Office by the operator, Professor GEORGE C. BLACKMAN, of the Medical College of Ohio, in a letter dated February 26, 1867. The operation had been briefly noted in the *Cincinnati Jour. of Med.*, 1866, Vol. I, p. 101, and was more fully detailed in the *Report on Amputations at the Hip Joint*, *Circular* No. 7, S. G. O., 1867, p. 43, with a chromolithographic sketch of the patient five months after recovery, from a drawing transmitted by Dr. BLACKMAN.

CASE 322.—Private Daniel H. Bowman, Co. C, 110th Pennsylvania, aged 24 years, was wounded on July 27, 1864, at Deep Bottom, on the left bank of James River. A conoidal musket ball entered at the upper posterior part of the right thigh, comminuted the femur from the trochanters downward for several inches and lodged. The wounded man was transported to Washington on a hospital steamer, and was received at Lincoln Hospital on July 30th. The injured limb was shortened two and a half inches; the soft parts were badly lacerated. On August 7th the position of the ball at the anterior part of the thigh was detected. An incision was made and the ball and several detached fragments of bone were removed. On August 17th the wound looked badly, and there was slight sloughing. For the next few weeks the patient lost ground steadily. There was profuse suppuration, with great constitutional irritation. There appeared to be no attempt at union at the seat of the fracture. The patient had become much emaciated, and his powers of resistance were failing daily. After due consultation it was determined to amputate at the hip joint. On September 15th the operation was performed by Assistant Surgeon J. C. McKee, U. S. A. The patient was rendered insensible by sulphuric ether. The method by antero-posterior flaps formed by transfixion was adopted. The amputation was rapidly completed and very little blood was lost. The patient did not rally, but died one hour after the operation, September 15, 1864. At the autopsy, the lungs were found to be attached to the thoracic walls by firm fibrinous adhesions. In the upper lobe of the right lung there were two small isolated abscesses. Otherwise the lungs were normal. The right weighed 13 and the left 11 ounces. The abdominal viscera were normal, save that the liver and kidneys were unusually small, the former weighing 44½ and the latter 9½ ounces. At the seat of the fracture of the femur (FIG. 101) there was no attempt at repair; the fragments were carious: a large one, consisting of nearly half of the cylinder of the shaft, was four inches long and was quite detached. Fissures penetrated the trochanters and extended posteriorly half-way up the neck of the bone.

FIG. 101.—Gunshot fracture of the femur. *Spec.* 2288.

CASE 323.—Sergeant Hiram H. Davis, Co. B, 156th New York, aged 26 years, was wounded at the battle of Opequan, Virginia, on September 19, 1864, by a conoidal musket ball, which passed through the fleshy part of the left thigh, and, entering the other thigh, fractured the upper third of the right femur. He was sent by his regimental surgeon, Dr. G. C. Smith, to the Sheridan Field Hospital, near Winchester, where the fracture was adjusted upon a double inclined plane. Thence he was transferred, on March 6, 1865, to the General Hospital at Frederick, Maryland, which reports the flesh wound in the left thigh healed, great deformity and shortening of the fractured limb, and copious suppuration from fistulous sinuses communicating with necrosed bone. On April 25th he was transferred, in a somewhat improved condition, to the Cuyler General Hospital at Germantown, Pennsylvania, where no special alteration in his symptoms or treatment is noted. On May 10th he was moved from Cuyler to Mower Hospital, and thence, on October 18th, to the Post Hospital at Philadelphia. The register of the Post Hospital states that the fracture of the femur was consolidated at the date of his admission, and that he was discharged from service on November 8, 1865. In the spring of 1866 Davis was received at the Episcopal (civil) Hospital in Philadelphia. The appearance of the injured limb at the date of his admission is indicated in the accompanying wood-cut (FIG. 103). The right lower extremity was shortened six and a half inches; there was false anchylosis of the knee and ankle joints on this side; extensive cicatrices on the thigh indicated the location of former sloughing; there were five fistulous canals communicating with diseased bone; apparently the entire upper portion of the femur was necrosed. On May 5, 1866, Dr. William S. Forbes, surgeon to the hospital, amputated the limb at the hip joint. Ether was employed as an anæsthetic, but it did not act satisfactorily. The vessels were controlled by the abdominal aortic compressor. An anterior flap was made by cutting from without inward, the integument being dissected up to form the longer portion of the flap. Then the femoral artery was tied; and then the bone was disarticulated and the posterior flap was completed. The hæmorrhage was estimated at less than eight ounces. The patient rallied bravely from the shock of the operation. Forty-eight hours after the operation the pulse fell, and for about five hours there was great depression. This was followed by a febrile reaction, accompanied by an erysipelatous blush, which, commencing at the outer angle of the wound, gradually involved its entire extent. After this the patient sank rapidly, and expired sixty-four hours after the operation, May 8, 1866. On examining the injured femur (FIG. 102) it was found to be imperfectly united by fragile masses of callus, which enclosed large fragments of dead or diseased bone.[1]

FIG. 102.—Partial union of gunshot fracture of the femur. [From a photograph by RHOADS.]

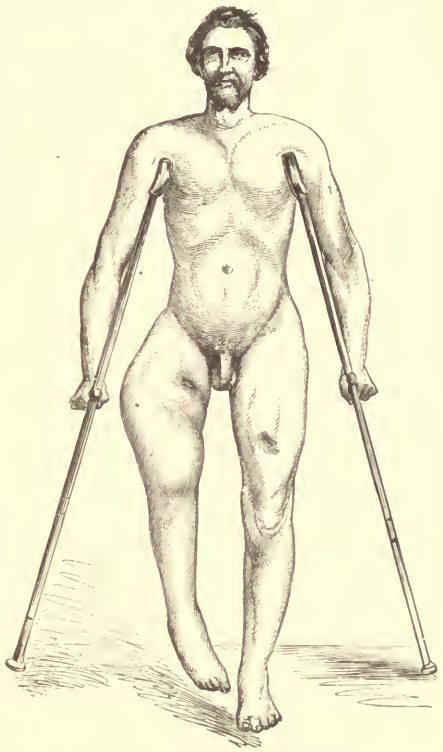

FIG. 103.—Gunshot fracture of the right femur with great shortening and deformity. [From a photograph by NEWELL.]

[1] MORTON (T. G.), *On Amp. Hip Joint, with the Hist. of the Cases*, in *Am. Jour. Med. Sci.*, 1866, Vol. LII, p. 36; *Circ.* No. 7, S. G. O., 1867, pp. 46, 64.

CASE 324.—Corporal Frederick Kelb, Co. G, 7th New York, was wounded at Fredericksburg, Virginia, December 14, 1862, by a conoidal musket ball, which fractured the right femur at the junction of the upper and middle thirds. After remaining for a fortnight in the field hospital of the 1st division of the Second Corps he was conveyed to Washington and placed, on December 25th, in the Patent Office Hospital, where the injured limb was placed in a fracture box and the wound was dressed with oakum. The case progressed favorably, and, on April 2, 1863, the patient was transferred to Judiciary Square Hospital, and, on May 9th, was sent to De Camp Hospital, at David's Island, New York. Acting Assistant Surgeon John C. DuBois reported: "The ball entered about one inch below the fold of the right natis, and, passing outward, shattered the femur at its middle, and lodged in the anterior part of the thigh. The ball was extracted two days afterwards. On January 1, 1863, six pieces of bone were removed. The limb was placed on a double inclined plane and cold water applied. Six weeks after, the long straight external and short internal splints of pasteboard were applied. This was removed in a few weeks and merely the short internal pasteboard splint retained. On April 2d and 8th, pieces of bone came away. The splint was then removed, and the limb suffered to lie on a hair mattress. May 6th, several pieces of bone removed. May 12th, firm union has taken place, with great deformity. External angular curvature, with about 4¾ inches shortening, as near as can be measured. His whole limb is everted, and he is unable to raise it. His general condition is much reduced. As union is firm no treatment can be adopted to relieve the deformity. July 10th, a few more pieces of bone have been removed. The probe reveals rough bone, not loose. Internal wound closed; sinus injected with dilute tincture of iodine. General health pretty good." On July 10th he was removed to McDougall Hospital, at Fort Schuyler; and on January 19, 1864, he was readmitted to De Camp Hospital. On June 8, 1864, he was discharged from the service of the United States. There was evidence of disease of the femur. On June 7, 1865, Kelb was admitted to St. Luke's Hospital, in New York City. There had been a series of recurring abscesses in the thigh, and it was believed that nearly the entire femur was necrosed. It was determined to amputate at the hip joint, and, on June 7th, the patient being anæsthetized by sulphuric ether and the aorta being compressed by Signoroni's clamp tourniquet, the amputation was performed by the attending surgeon, Dr. R. F. Weir, by the method recommended by Dr. Van Buren, an anterior flap being formed by transfixion and a posterior one by section from without inward. The hæmorrhage was slight and the shock was moderate. The case at first progressed very favorably. Three weeks after the operation the healing of the stump was far advanced and the patient was able to leave his bed. After this he began to lose ground very gradually. He died on October 4, 1865, nearly four months after the operation. At the autopsy, the pelvis of the right kidney was found to be blocked up with numerous calculi; there was an abscess in the left kidney, and there was tuberculosis of both lungs at an advanced stage. The stump was still open and the horizontal portion of the os pubis was necrosed. A section of the exarticulated femur presented the characteristic lesions of chronic osteomyelitis.[1]

CASE 325.—Private James McGeehen, Co. K, 107th Pennsylvania, aged 48 years, was wounded at the battle of Gettysburg, on July 1, 1863, by a conoidal musket ball, which entered at the inner aspect of the middle of the right thigh and traversed the entire thickness of the limb, badly comminuting the shaft of the femur in its progress. He lay upon the field for about five hours and lost a good deal of blood, although none of the larger vessels appeared to have been wounded. He was then conveyed to a temporary field hospital, and his wounds were dressed. On July 6th he was removed to the Seminary Hospital at Gettysburg, where he remained until September 4th, at which date there was profuse suppuration and some sloughing at the wound of entrance, and it was deemed expedient to put the patient under canvas in the Camp Letterman Hospital. On October 11th he was moved to the Town Hall Hospital at Chambersburg. Here he was able to move about on crutches, but the injured limb was greatly enlarged and deformed, and numerous fistulous openings successively formed, through which pus was freely discharged and bits of necrosed bone were occasionally eliminated. On April 23, 1864, by order of the Medical Director at Harrisburg, he was discharged from the military service of the United States on account of "permanent lameness resulting from gunshot fracture of the right femur." Nearly two years subsequently, April 9, 1866, McGeehen entered the Pennsylvania Hospital at Philadelphia. His general condition was satisfactory; his spirits were excellent; a careful examination failed to detect organic disease of any viscus. His injured thigh remained greatly deformed and enlarged; the original wounds had long since closed, but there were numerous fistulous sinuses, discharging on an average a gill of pus daily, and, at intervals, scales or nodules of necrosed bone; three tracks seemed to ascend to within an inch and a half of the trochanter major. It was thought probable that above this point the femur was healthy. After a careful consultation, it was determined to remove the limb at the hip joint. The patient was placed upon tonic treatment, with nourishing diet; his bowels were also carefully regulated. He complained of nothing except his cough, arising from a slight bronchitis, which, however, gave him very little trouble. On April 21, 1866, Dr. D. H. Agnew, Surgeon to the Pennsylvania Hospital, removed the limb. The abdominal tourniquet was employed, and by this means the circulation of the abdominal aorta was completely controlled. The method of operating was by antero-posterior skin flaps, with circular division of the muscles. The femoral artery was ligated after the anterior flap was dissected up. The femoral vein was not included in the ligature. Twenty-one of the smaller arteries required deligation. The disarticulation was accomplished in a minute and a half. Pressure was maintained by the abdominal tourniquet for twenty-seven minutes while the minor vessels were secured. The hæmorrhage during the entire operation did not exceed three ounces, scarcely more than an ounce and a half of which was arterial blood. Ether alone was employed in inducing anæsthesia, and about three ounces sufficed, as he inhaled it without effort and soon came under its influence. The stump was packed with lint. The leg, when drained entirely of blood, weighed twenty-two pounds, the entire weight of the body at that time being about one hundred and forty-five pounds. Immediately after his removal to the ward an enema of half a drachm of tincture of opium was administered, and this was repeated at eight in the evening, when the stump was closed by lead sutures and dressed with cerate. On the following day the patient had entirely reacted from the slight amount of shock following the operation. Pulse, which, under agitation from the approaching operation, had been averaging from 100 to 115, had fallen to 96; respiration 20; skin moist and pleasantly warm. No stimulus; moderate diet, and a drachm

[1] LIDELL (J. A.), *On the Secondary traumatic Lesions of bone, etc.*, in *U. S. San. Com. Mem.*, 1870, *Surgical*, Vol. I, p. 438. W. H. VAN BUREN, *Transactions of New York Academy of Medicine*, Vol. I, 1851–57, p. 123, and *Contributions to Practical Surgery*, Philadelphia, 1865, p. 9. M. A. GUÉRIN (*Médecine Opératoire*, p. 220) has suggested the same plan. See also *Circular* 7, S. G. O., 1867, pp. 41, 64.

of laudanum by enema. On April 23d he was more comfortable. Had passed a quiet night; had a good appetite. A considerable part of the stump had united by first intention, and there was only a little greasy, watery discharge from the inner angle. Dry dressing continued. On April 24th he was doing well. Discharge thin and small, and flaps were rapidly uniting. He was ordered four ounces of whiskey daily, and half an ounce of Basham's mixture. Dry dressing continued. April 25th, no unpleasant symptom save a rather frequent bronchitic cough. The flaps are united at the middle of the stump; the discharge comes from the angles, and it is evidently due to the breaking down of the subcutaneous fat. Laudanum enemata were now given twice daily; warm-water dressings were substituted for the dry applications. April 26th, he ate and slept well, but was troubled by his cough, which was severe, accompanied by tenacious mucous sputa. The opiate enemata were suspended, and from two to four drachms of solution of sulphate of morphine were given every night; during the day, a sedative expectorant mixture every three hours. The stimulus was not increased. April 27th and 28th, steady improvement; cough less troublesome, discharge more purulent and increased in quantity; warm-water dressing still applied. April 29th, discharge purulent and quite abundant, amounting, probably, to three or four ounces daily. April 30th, much the same, excepting that the cough was again more troublesome. The union of the flaps was daily becoming more secure, and the discharge now consisted of laudable pus. Four ligatures came away. May 1st, seemed brighter and better than any day heretofore; ate heartily; stump looked perfectly healthy, discharge moderate; two more ligatures came away. May 2d, condition excellent; the stump was rapidly healing; the skin remained as soft and healthy as on the day of operation. Most of the stitches had been cut away. The pulsation of the external iliac artery, which for several days was very marked, had diminished greatly, and seemed as though propagated through a firm clot. He had been troubled considerably with cough for two days. At midnight, in the absence of the watchman, hæmorrhage occurred, and on the return of the latter the patient was found dead. Upon removing the dressing it was seen that a secondary hæmorrhage had taken place. Most of the blood was retained either in the stump or inside the dressing; the little that had escaped had flowed from the inner angle of the stump back under the body. The hæmorrhage was found to have proceeded from the femoral artery. The most powerful restorative measures were employed for a long time, but without producing the slightest effect. Upon dissecting the stump, the union was found to be complete over one-half of the entire surface of the flaps, whilst the deeper portions of the stump were covered with healthy granulations. The femoral vein, which was not ligated, was entirely occluded; the femoral artery was patulous, its inner coat projecting somewhat beyond the other two; the inner coat of the artery was deeply stained and roughened for at least one and a quarter inches above the extremity; higher up it appeared perfectly healthy; the ligature which had secured the vessel was still attached to a shred of the outer fibrous coat. It had evidently very recently cut its way through, and still retained in its loop the end of the vessel which had sloughed off. Lying immediately in front of the femoral vessels, embedded in a recent clot, was found the plug which had been driven out of the artery. This was a firm, flesh-colored clot, of the calibre of the vessel, and long enough to reach up to the origin of the deep epigastric and circumflex iliac arteries. No positive testimony could be obtained that the patient had suffered from one of his violent spells of coughing immediately before the accident, as all in the ward were asleep excepting the watchman; but all the appearances render it highly probable that directly after the ligature of the femoral became detached the violent succussion of the diaphragm incident to a paroxysm of coughing had expelled the clot from that vessel. All the other vessels appeared completely obliterated. Only the thoracic and abdominal cavities were examined. The lungs were large and free from pleuritic adhesions. They were somewhat emphysematous, and showed a large amount of pigment over their surface. The anterior portions were anæmic, but posteriorly there was marked congestion of the lower lobes. The heart was quite flabby and moderately dilated. There was no valvular disease or apparent insufficiency, but microscopic examination showed advanced fatty degeneration of the muscular fibres. The liver was also very soft and fatty. Kidneys anæmic and pale. Other viscera healthy. The large vessels and heart contained very little blood. There was a small collection of unhealthy purulent matter in the manubrium of the sternum. The limb, upon dissection, showed very great disease of all the soft parts between the trochanters of the femur and the knee joint. The muscles had undergone fatty degeneration; their sheaths were very much hypertrophied and of almost cartilaginous density. Toward the bone there was a thick layer of tenacious colloid bone cartilage, apparently resulting from periosteal disease. Through the dense and morbid mass fistulous tracks radiated in every direction, many of them containing small spiculæ of bone. The bone itself was diseased from the condyles to within one and a half inches of the lesser trochanter. The shaft had been fractured obliquely, with considerable comminution, and union had taken place by formation of a very large amount of dense bony structure, which projected in spurs and ridges in all directions. The original track of the ball was marked by a deep groove, and one or two small fragments of lead were found embedded in the bone. There was a large anfractuous cavity, bridged over in places by newly formed bone, which still contained several quite large sequestra. There was incipient periosteal disease along the linea aspera up to the trochanters. A section of the bone showed that if osteo-myelitis had existed it had not extended within several inches of the trochanters.[1]

FIG. 104.—Consolidated shot fracture of femur, with secondary lesions. [From a photograph by WILLARD.]

In the four foregoing fatal secondary amputations, one succumbed to the shock of operation in an hour; another died on the third day with surgical fever and erysipelas; a third in seventeen weeks with phthisis and lithiasis, the stump nearly healed; and a fourth

[1] An account of this case was published by Dr. THOMAS G. MORTON, in *The American Journal of Medical Sciences*, 1866, Vol. LII, p. 33 (*Compound Comminuted Fracture of Right Femur, from Wound by Minié Ball. Amputation at Hip Joint after Thirty-four Months*, by Dr. D. H. AGNEW, *Death from Secondary Hæmorrhage on the Twelfth Day*), from notes carefully and admirably drawn up by Dr. WILLIAM PEPPER, the resident surgeon at the Pennsylvania Hospital, under whose immediate care the patient was. See also *List of the More Important Specimens added to the Pathological Museum of the Pennsylvania Hospital during the year* 1867, by WILLIAM PEPPER, M. D., Curator, in *Penn'a Hospital Reports*, Vol. I, 1868, p. 399.

perished on the eleventh day, from giving way of the femoral at the point of ligation. In two of the following cases the patients sank from shock in a little over twenty-four hours. In the third case, secondary hæmorrhage was restrained by ligating the external iliac on the eleventh day, but bleeding recurred fatally on the twenty-third day.

CASE 326.—Antonio Mutieres, a Mexican, aged 30 years, employed by the depot quartermaster at Fort Union, New Mexico, was wounded, in an altercation with another Mexican, on May 10, 1867, by a conoidal pistol ball, which entered two inches below the anterior superior spinous process of the left ilium, and passed downward and lodged in the neck of the left femur at its junction with the head. He was admitted to the Post Hospital at Fort Union on May 11th, when Assistant Surgeon DuBois, Post Surgeon, enlarged the wound and extracted the ball and wadding with a pair of Tiemann's bullet forceps. After the removal of the ball the finger could be passed half an inch or more into the substance of the cervix, in which the ball had been embedded. The patient suffered but little pain, but he gradually lost flesh and strength from the surgical fever and suppuration. On June 14th he began to have severe pain, running up the side of the trunk and downward to the knee. This became more continuous and distressing on the succeeding day. Surgeon J. C. McKee, U. S. A., saw the patient in consultation, at this date, and advised that amputation should be performed in preference to an excision. At noon, on June 22d, Assistant Surgeon DuBois operated, assisted by Dr. Short, of Los Vegas, and Dr. Simpson, of Moro. A rude clamp abdominal compressor had been made at the post under the direction of Dr. DuBois, and this instrument, applied a little above and to the left of the umbilicus, effectually controlled the aorta. A long anterior and short posterior flap were made. The disarticulation was completed in fifteen seconds. Eighteen arteries were ligated. The soft parts were much diseased, and there was a large amount of venous hæmorrhage. The anæsthetic employed was a mixture of equal parts of chloroform and ether. The patient breathed well notwithstanding the compression of the abdomen. The flaps were left open, a cerate cloth being interposed. In the evening the patient was free from pain and had slept a little; but he had not reacted satisfactorily, and talked and laughed excitedly. His pulse was at 160 and feeble. It was fuller and less frequent immediately after the operation. Milk punch had been given in small quantities every fifteen minutes. Hypodermic injections of tincture of opium in doses of from ten to thirty drops, repeated every twenty minutes or at longer intervals, were now administered. This remedy appeared to bring the pulse up, and to act as a stimulant and not as a narcotic—a therapeutic result observed by Dr. DuBois in other cases of shock. The patient died June 23, 1867. At the autopsy, the acetabulum was found to be extensively diseased.[1]

CASE 327.—Private Michael O'Neil,[2] Co. E, 58th Massachusetts, aged 19 years, was wounded at the battle of Cold Harbor, June 3, 1864, by a conoidal musket ball, which entered the upper anterior part of the right thigh, and passed backward and slightly upward through the limb, comminuting the upper extremity of the femur. The fissures extended about three inches down the shaft, and through the trochanters half way up the neck. The wounded man was sent in an ambulance to the White House, on the York River, and thence by a hospital steamer to Alexandria, where he was received at the Third Division Hospital on June 7th. On admission his limb was much swollen, yet there was but little pain, and this was not increased by moving the limb. His general condition was satisfactory, though he reported that he was subject to attacks of intermittent fever. His limb was arranged in a straight position, supported by cushions and pillows; evaporating lotions were applied to the wound, and a nutritious diet was ordered. On June 10th, several fragments of bone were extracted. On June 12th the patient had a chill, and was ordered to take four grains of sulphate of quinia every four hours. The injured limb was now suspended by means of Smith's anterior splint. On June 24th there was another chill. The wound was now suppurating freely, and the limb was very sensitive when handled. On June 31st there was a slight chill. From this date to August 1st there was little change in the symptoms. It was now decided that there was little hope of consolidation of the fracture. The suppuration was profuse, and it was believed that the patient would inevitably succumb ultimately to the constitutional irritation and the drain upon the system. It was determined, therefore, that amputation should be performed, and the character of the fracture admitted only of amputation at the hip joint. On August 10th, the patient was anæsthetised by sulphuric ether, and amputation at the hip joint was performed by the lateral flap method by Surgeon Edwin Bentley, U. S. V. There was but little hæmorrhage, and the operation was borne well. The patient had an anodyne, and was freely stimulated. For forty-eight hours after the operation there was some febrile excitement, with complete anorexia. The fever then subsided and the appetite returned. The wound looked well, and the amount of suppuration was trifling. The case progressed very favorably until August 20th, when secondary hæmorrhage supervened from ulceration of the femoral near the ligature. About six ounces of blood were lost. A ligature was promptly placed upon the external iliac just above Poupart's ligament. After the operation the patient was very weak and faint, and stimulants were freely administered. On August 22d there was an excess of febrile excitement, but this abated on the following day and the appetite again became moderately good. On August 28th there was nausea and vomiting, which persisted for forty-eight hours. The wound at this time had assumed a very unhealthy appearance, and the patient had become much emaciated. On the night of September 1st there was delirium. The case terminated fatally on the morning of September 3d, twenty-three days after the operation. At the autopsy the viscera was found to be healthy, except that there was an old cicatrix with cretaceous deposit at the apex of the left lung. The lips of the wound were united in nearly their entire extent. There was a large accumulation of pus within the flap, bathing the acetabulum and the gaping mouth of the femoral artery. The wound left by the incision above Poupart's ligament, through which the external iliac was tied, communicated with an abscess between the iliacus externus muscle and the iliac fascia, filled with pus. The ligature on the external iliac was found to be

FIG. 105.—Gunshot fracture of the upper extremity of the right femur. *Spec.* 3098.

[1] See DUBOIS (H. A.), *A Case of Amputation at the Hip Joint for Gunshot Wound of the Head of the Femur*, in *The Medical Record*, 1868, Vol. II, p. 266; *Circular* No. 7, S. G. O., 1867, p. 46; *Circular* No. 3, S. G. O., 1871, p. 214.

[2] The abstract of this case was compiled from a report by the operator, Surgeon E. BENTLEY, U. S. V. See *Circular* No. 7, S. G. O., 1867, p. 39.

placed about half an inch below the origin of the epigastric; the circumflex iliac was given off a little below the epigastric. There was a firm conical plug in the external iliac, ending at the origin of the epigastric. Through this plug ran a canal communicating with the mouth of the circumflexa ilii; this canal was closed by a clot colored by included red corpuscles and of more recent formation than the plugging clot. Ulceration of the external iliac just above the ligature had commenced. The femoral vein was collapsed and contracted; the external iliac vein was distended by a dirty fluid, which, when placed under the microscope, was found to abound in pus globules. Higher up, the contents of the vein consisted of a granular detritus. The branches of the external iliac vein was blocked up by dense coagula. The deep-seated abdominal lymphatic glands were enlarged and deeply injected. An examination of the fractured femur showed that it was shattered, with much loss of substance, just below the trochanters. The fissures ran up with the capsule, and the fractured extremities of the bone were carious and had lost tissue by absorption.

CASE 328.—Private John Williams, Co. F, 13th Ohio Cavalry, aged 44 years, was wounded at Peebles' Farm, near Petersburg, September 30, 1864, by a conoidal musket ball, which passed through the left thigh and contused or partially fractured the femur. He was conveyed in an ambulance to the field hospital of the first division of the Ninth Corps, and his wounds were dressed, and he was then sent by rail to City Point, and thence to the North in a hospital transport steamer. On October 7th he was received at the General Hospital at Beverly, New Jersey. For over three months the case progressed very favorably under the simplest treatment; but early in February abscesses formed in the thigh, and when they were incised they discharged copiously an offensive pus. About the same time the patient was attacked by an obstinate diarrhœa. On February 17, 1865, an exploratory incision was made, and a careful examination with the finger and the probe indicated that the femur was necrosed as high as the trochanters. It was then considered that amputation at the hip joint presented the only chance for preserving life. The operation was performed by Assistant Surgeon Clinton Wagner, U. S. A. The patient inhaled chloroform; anterior and posterior semilunar flaps were made by transfixion; the femoral artery was tied as soon as divided; disarticulation was then effected, and the operation completed by securing the minor vessels. Very little blood was lost. The patient reacted satisfactorily, but sank and died, apparently from shock, twenty-nine hours after the operation. An autopsy revealed a healthy condition of the viscera and no lesion worthy of special mention. The femur displayed an interesting example of necrosis of the entire diaphysis. It is numbered *Specimen* 84 in the collection of the Army Medical Museum, and is represented in the adjacent wood-cut, FIG. 106.

FIG. 106.—Necrosis of the femur following gunshot injury. *Spec.* 84.

TABLE XVII.

Summary of Nine Cases of Secondary Amputation at the Hip Joint.

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATE OF INJURY.	NATURE OF INJURY.	DATE OF OPERATION.	OPERATION AND OPERATOR.	RESULT AND REMARKS.
1	Lemon, G. W., Pt., C., 6th Maryland, age 30.	May 5, 1864.	Conoidal ball fract. left femur, junct. upper thirds; bedsores; abscesses. May, 1865, profuse suppuration, bone firmly consolidated.	Oct. 12, 1865.	Anterior and post'r semilunar flap, by Surgeon E. Bentley, U. S. V.	Steady imp. Dec., 1865, stump healed. Disch'd Feb. 3, 1866. *Specs.* 4386, 4167, 5040. *Phot. Ser.* 136, 137. *Circ.* 6, S. G. O., 1865, p. 52. *Circ.* 7, S. G. O., 1867, pp. 42, 64.
2	*Longmoor*, W. W., Pt., age 25.	June 11, 1864.	Conoidal ball shattering shaft right femur; abscesses; nec. bone rem'd; protracted irritation and exhaustive suppuration.	Jan. 18, 1866.	Lacanchie's method; circular cut thro' skin, integ. retracted, muscles div. circularly down to bone; vertical incision on outer side, by Prof. G. C. Blackman.	Rapid recovery. 1870, general health good. BLACKMAN(G.C.), *Amputations at Hip Joint*, in *Cincinnati Jour. of Med.*, 1866, Vol. I, p. 101. *Circ.* 7, 1867, pp. 43, 64.
3	Bowman, D. H., Pt., C, 110th Pennsylvania, age 24.	July 27, 1864.	Conoidal ball com. right femur from trochanters down several inches. Aug. 17th, ball and fragm'ts bone extracted; profuse suppuration; no union.	Sept. 15, 1864.	Antero-posterior flaps, by Ass't Surgeon J. C. McKee, U.S.A.	Did not rally. Died one hour after operation. *Spec.* 2288. *Circ.* 6, S. G. O., 1865, p. 50. *Circ.* 7, S. G. O., 1867, pp. 41, 64.
4	Davis, H. H., Sergeant, B, 156th New York, age 26.	Sept. 19, 1864.	Conoidal ball fract. upper third right femur. Mar., '65, healed with great deformity. '66, diseased bone; fistulous canals.	May 5, 1866.	Anterior posterior flap, by Dr. W. S. Forbes, Civil Hospital, Philadelphia.	Rallied well. Died May 8, 1866, sixty-four hours after operation. *Circ.* 7, S.G.O., 1867, pp. 46, 64.
5	Kelb, F., Corporal, G, 7th New York.	Dec. 14, 1862.	Conoidal ball fract. right femur, junct. up. thirds. June 8, '64, fracture consolidated. June, 1865, abscesses, necrosis.	June 7, 1865.	Anterior flap by transfix'n, posterior flap by sect'n from without, in, by Dr. R. F. Weir, St. Luke's Hosp., N. York City.	July 1st, able to leave bed; after this failed, and died Oct. 4, 1865. *Circ.* 6, S. G. O., 1865, p. 52. *Circ.* 7, S. G. O., 1867, pp. 41, 64.
6	McGeehen, J., Pt., K, 107th Pennsylvania, age 48.	July 1, 1863.	Conoidal ball badly comminuting right femur. Oct. 11, '65, able to move on crutches—limb deformed, bone necros'd. April, '66, numerous fistulous openings discharging.	April 21, 1866.	Anterior post'r skin flap, circ. division of muscles, by Dr. D. H. Agnew, Pennsylvania Hospital.	April 23d, heal'g by first intent'n. 26th, bronchial cough troublesome. May 2d, hæm. from femoral artery; died. *Circ.* 7, 1867, pp. 44, 64.
7	Mutieres, A., Mexican, teamster in Quartermaster's Department, age 33.	May 11, 1867.	Revolver ball ent'g left thigh, lodging in neck of femur; ball removed—lost strength daily.	June 22, 1867.	Long anterior, short posterior flap, by Ass't Surgeon H. A. Dubois, U. S. A.	Died June 23, 1867. *Circ.* 7, 1867, pp. 46, 64. *Circ.* 3, S. G. O., 1871, p. 214.
8	O'Neil, M., Pt., E, 58th Massachusetts, age 19.	June 3, 1864.	Conoidal ball comminuting up. extremity right femur. June 10, fragments extract'd. Aug. 1st, profuse suppuration.	Aug. 10, 1864.	Lateral flap, by Surgeon E. Bentley, U. S. V.	Ulceration of femoral. Aug. 20, hæm., lig. of ext. iliac. Died Sept. 3, 1864. *Spec.* 3098. *Circ.* 6, S. G. O., 1865, p. 50. *Circ.* 7, S. G. O., 1867, pp. 39, 64.
9	Williams, J., Pt., F, 13th Ohio Cavalry, age 44.	Sept. 30, 1864.	Conoidal ball thro' left thigh, partially fract'g or contusing femur. Feb, '65, exam. found femur necrosed to trochanters.	Feb. 17, 1865.	Anterior and posterior semilunar flaps, by Ass't Surgeon C. Warner, U. S. A.	Died, twenty-nine h'rs after, from shock of operation. *Spec.* 84. *Circ.* 6, S. G. O., 1865, p. 50. *Circ.* 7, S.G.O., 1867, pp. 41, 64.

Reamputations at the Hip Joint.—The category of exarticulations at the hip for diseased conditions succeeding previous amputations in the continuity of the thigh, pertaining to the surgery of the late civil war, includes nine examples with only three deaths.[1]

CASE 329.—Private W. Cotter, Co. E, 9th New Hampshire, aged 27 years, was wounded at Petersburg, July 30, 1864. Surgeon J. Harris, 7th Rhode Island, recorded his admission to the field hospital of the 2d division, Ninth Corps, and noted: "Fracture of thigh, lower third; amputation of thigh at middle third." From the field hospital the patient was transferred to City Point, and thence to Washington, August 3d. Assistant Surgeon W. F. Norris, U. S. A., contributed the pathological specimen, shown in the wood-cut (FIG. 107), with the following history by Acting Assistant Surgeon H. Gibbons: "The patient was admitted to Douglas Hospital with primary amputation of right thigh, lower part of middle third. The operator had made a long posterior skin flap, which was turned up over the muscles and bone, and attached to the integument anteriorly by means of several sutures. When first seen the stump was greatly swollen, partly from a retention of pus by the bag-like flap. A couple of sutures were removed and the pus evacuated. On August 4th, an incision was made in the dependant portion to admit of free drainage, and poultices were ordered. Appetite and sleep were not greatly disturbed, and there was not as much irritative fever as in most similar cases. Ordered stimulants, tonics, and generous diet. August 13th, swelling much reduced; constitutional irritation less. Ligature of femoral artery separated. The poultices were alternated with flannel dressings till September 1st, when wet cloths were substituted. Flaps mostly united; appetite poor; sleep disturbed; stump painful. Ordered morphia at bed-time. September 13th, patient sits up and walks about with some assistance. Stopped the stimulant. September 28th, stump doing well; swelling gone; dead bone felt with the probe Had an attack of diarrhœa, which lasted but a few days. The irritability of the stomach was a source of continual complaint for two or three months. The various stomachics relieved but temporarily; nevertheless there was marked improvement, especially during November, the patient being about on his crutches daily. November 29th, divided the cicatrix (but a small fistulous opening was still remaining) and removed a sequestrum nearly six inches long. It was attended with some difficulty, yet not as much as was experienced in similar cases. The sequestrum consists of the entire bone at the lower extremity, but tapers to two or three points at the other; the circumference is complete for three inches. In its centre, surrounding the medulla, was found a beautiful transparent flake of new bone. The femur contained, as in like cases, a large amount of new bone. July 16, 1865, the cavity left in the stump has never entirely closed, but continues to discharge, and refuses to heal, though various stimulating injections have been resorted to. It is over three inches deep. The patient is in a promising state of health." On November 2d, the patient was transferred to the Harewood Hospital. Surgeon R. B. Bontecon, U. S. V., reported that he was doing well on December 31st, but that there was still a "fistulous discharge from the stump." At the closing of the Harewood Hospital, on May 1, 1866, the patient was transferred to the Washington Post Hospital, where the specimen represented in the adjacent cut (FIG. 108) was removed. Assistant Surgeon W. Thomson, U. S. A., who performed the operation, reported as follows: "Two sinuses lead to the interior of new bone, which have failed to close since the date of the first operation. On June 6, 1866, resection of four inches of femur from the end of the stump, after previously made incisions into the soft parts, was performed. Ether was used, and the incisions were united by silver sutures. June 30th, wound has healed kindly, two-thirds by first intention, leaving a sinus on the under surface of the stump still discharging. September 30th, although mostly healed the stump is still indurated. Two sinuses, evidently leading to necrosed fragments of femur, are still open and keep up an offensive discharge. Small intercellular abscesses form occasionally. Patient in good condition." He was discharged from service October 15, 1866, and pensioned. In the following year he was reported as having been treated for a time at the Bellevue Hospital, New York City, where Drs. H. B. Sands and F. H. Hamilton are said to have removed several pieces of necrosed bone. On October 5, 1871, the pensioner entered the Providence Hospital

[1] Amputation at the hip, after previous amputation in the continuity of the thigh, was first performed by G. J. GUTHRIE, in 1812, in the case of Private Mason, 23d Infantry, or Welsh Fusiliers, wounded at Ciudad Rodrigo. GUTHRIE, *On Gunshot Wounds of the Extremities*, London, 1815, 8vo, p. 141. Of the nine cases pertaining to the American civil war, the earliest, May 21, 1864, was practised by Dr. A. B. MOTT, on the stump of a prior amputation for bayonet stab of the knee. On September 21, 1864, Dr. GURDON BUCK and Dr. F. HASSENBURG disarticulated at the hip unsuccessfully, after prior amputations for shot fracture. In 1865, Dr. J. H. PACKARD had the first successful reamputation at the hip after previous amputation in the thigh for shot fracture, and Dr. A. M. FAUNTLEROY successfully reamputated, under similar conditions, on March 11th. In 1866, the successful reamputation at the hip by Dr. T. G. MORTON, and a like operation, with fatal result, by Dr. J. B. WHITCOMB, were practised. In 1870, and in 1871, Dr. G. A. OTIS and Dr. N. S. LINCOLN performed successful reamputations at the hip, after prior amputations of the thigh, for shot fracture. Professor J. FAYRER (*Clin. and Path. Obs. in India*, London, 1873, pp. 84, 489), in 1867, unsuccessfully reamputated at the hip after prior thigh amputation for an incised wound of knee. Besides these eleven reamputations at the hip, the records of civil surgery afford at least twenty-one examples, viz: five following amputations for bad fractures of the femur—J. SYME'S, in 1848 (*The Medical Times*, London, 1849, Vol. XIX, p. 252); J. ROUX'S, in 1859 (*Gaz. hebd.*, 1860, pp. 292, 297), recoveries; J. F. HEYFELDER'S, in 1861 (*Deutsche Klinik*, 1862, S. 275), fatal; J. FAYRER'S, in 1864, recovery; and J. FAYRER'S, in 1865, fatal (*Clin. and Path. Obs. in India*, 1873, p. 489). There were eight exarticulations following prior amputations for ostitis or ill-defined lesions, viz: A. COOPER'S, in 1824 (*Lond. Lancet*, 1824, Vol. II, p. 96); BRADBURY'S, in 1851 (*Bost. Med. and Surg. Jour.*, 1852, Vol. LXVI p. 349); B. BECK'S, in 1854 (*Deutsche Klinik*, 1856, No. 47); ROSER'S, in 1857 (THIEME'S *Diss.*, Leipzig, 1867, p. 9), successful; and TEXTOR'S, in 1851 (ESCHE'S *Diss.*, Würzburg, 1863); CHELIUS'S, in 1853 (THIEME'S *Diss.*, Leipzig, 1867, p. 8); HEYFELDER'S, in 1854 (THIEME'S *Diss.*, Leipzig, 1867, p. 8); and HANCOCK'S, in 1860 (*Lond. Lancet*, 1860, Vol. I, p. 319). Eight exarticulations followed prior amputations for malignant growths, viz: MAYO'S, in 1835 (COSTELLO'S *Cyclop.*, 1841, Vol. I, p. 182); BOISSEAU'S, in 1841 (METZ'S *Diss.*, Würzburg, 1841, p. 17); W. S. COXE'S, in 1844 (*Mem. on Amp. at the Hip Joint*, London, 1845); VAN BUREN'S, in 1850 (*Contrib. to Pract. Surg.*, 1865, p. 10); GROS CLARK'S, in 1866 (*Lond. Lancet*, 1867, Vol. I, p. 11), successful; and CHELIUS'S, in 1845 (BRUCH, *Die Diagnose der bösartigen Geschwülste*, Mainz, 1847, p. 3); VOLKMANN'S, in 1868 (*Deutsche Klinik*, 1868, p. 338); and J. LISTER'S, in 1872 (REYHER in LANGENBECK'S *Archiv*, B. XVII, p. 516), fatal cases.

at Washington, with the stump still in a diseased condition; and ten days afterwards Dr. N. S. Lincoln exarticulated the remaining part of the femur, consisting of the head, neck, and trochanteric portions, which was also contributed to the Museum, and is represented in the annexed cut (FIG. 109). The femoral vessels were respected, so that the disarticulation might be said to have resembled an excision or enucleation rather than a reamputation. The patient was able to be about in a short time; and, on April 22, 1872, he visited the Army Medical Museum, and a photograph was made of the stump, which is copied in the adjoining wood-cut (FIG. 110). The pensioner subsequently entered the National Military Asylum at Hampton, Elizabeth City County, Va., where Examiner C. McDermont certified the following: "The right leg has been amputated at the hip joint. This was the third amputation performed on the limb. Since the last operation he has been troubled with abscesses in and about the cicatrix, which have not healed, though a year has almost elapsed since the disarticulation was made. It is my belief that the tissues of the wounded limb have been diseased and never free from ulceration since he was wounded. His general health has been considerably impaired by the constant irritation and drain upon his system." This pensioner died at Queenstown, Ireland, January 21, 1874, while on furlough from the Asylum.

FIG. 109.—Exarticulated head and trochanters of right femur after osteomyelitis. *Spec.* 5946. ½

FIG. 110.—Cicatrix six months after coxo-femoral disarticulation and reamputation. [From a photograph.]

CASE 330.—Private Julius Fabry, Co. K, 4th Artillery, aged 38 years, was wounded at Deep Bottom, Virginia, August 16, 1864. Surgeon B. Gesner, 10th New York, reported: "Severe shot wound of left knee joint; amputation at lower third of femur. Sent to general hospital at City Point, Virginia, August 17th." He was admitted, on August 20th, into Satterlee Hospital, Philadelphia, from City Point. Surgeon I. I. Hayes, U. S. V., reported: "Gunshot wound of left leg by round ball, which embedded itself in knee joint; also conical ball, which was extracted high up on outer side of left thigh. August 17, 1864, circular amputation of lower third of left thigh. Improving slowly; simple dressings, tonics, and stimulants." On an unsigned case book of Ward 3, of Satterlee Hospital, the progress and treatment of the case are recorded as follows: "Stump looks well; patient somewhat weak but doing well. August 26th, suppurates very freely. August 28th, conical ball extracted from outer side of thigh two inches below great trochanter. Patient states that he saw one other ball extracted from the wound. September 1st, doing well; suffers from a bedsore contracted before he came here. States that he lost much blood during the amputation, which accounts for his weak and anæmic condition. September 9th, doing well. 21st, improving slowly. November 8th, transferred to Ward A." The progress of the case is continued on another case book, also unsigned: "December 2d, wound still discharging copiously. Bone exposed about one-eighth of an inch; general health middling, appetite good, bowels regular. Some difficulty with his urinary apparatus; detected pus in urine. January 9, 1865, morphia ceases to have any effect except to constipate. Remains much the same, better and worse, alternately, every ten or twelve days. February 4th, made an incision on external side of stump some two inches in length, just cutting the fascia, and removed a small piece of woolen. The muscles were not affected by the

FIG. 111.—Left femur, from a case of reamputation for osteomyelitis following shot injury. *Spec.* 5614, A. M. M.

FIG. 112.—Cicatrix twelve months after coxo-femoral disarticulation and reamputation. [From a photograph.]

superficial sinus." On May 22, 1865, this soldier was sent to regimental headquarters at Fort Washington, whence he was discharged from service January 1, 1866, on surgeon's certificate of disability, signed by Surgeon John H. Bayne, U. S. V. In October, 1865, the patient received an artificial limb but could not use it without discomfort. Fabry was admitted into the Soldiers' Home January 31, 1866. The remnant of the femur was affected by osteomyelitis, and Surgeon C. H. Laub, U. S. A., had frequent occasion to have the stump poulticed and abscesses opened. October 27, 1866, Assistant Surgeon J. S. Billings, U. S. A., made an exploratory and palliative operation, cutting down on the outer aspect of the thick involucrum a little below the trochanter major, trephining over one of the cloacæ, and discovering a sequestrum consisting of the shaft of the femur. Fabry was pensioned, and remained at the Soldiers' Home for the next three years, suffering acutely, at times, from suppuration in the stump, and again enjoying intervals of comparative comfort. The general health did not give way materially under the protracted suppuration. The patient was exempt from albuminuria, and the viscera generally were in a normal condition. The nervous system seemed shattered, a result ascribed to the inordinate doses of narcotics which the patient consumed. On May 15, 1870, Assistant Surgeon George A. Otis, U. S. A., exarticulated at the hip and removed the stump. The single anterior flap procedure was used, only the flap was cut from without inward, because the great masses of foliaceous callus enveloping the upper third of the femur precluded transfixion. The accompanying wood-cut (FIG. 111) will indicate the extent of these osseous formations. Fabry had a rather rapid convalescence, being about on crutches in twenty-one days, and soon afterwards able to ride about the grounds at the Soldiers' Home. A photograph of the patient, made at the Army Medical Museum a year after the operation, is copied in the wood-cut, FIG 112. On May 15, 1878, eight years after the operation, Fabry has had no trouble with his stump. He has never been willing to attempt the expedient of an artificial limb.[1]

The next case is exceptional inasmuch as the amputation and reamputation followed a bayonet stab in the knee instead of shot injury.

CASE 331.—Private Lewis Francis, Co. I, 14th New York Militia, aged 42 years, was wounded July 21, 1861, at the first battle of Bull Run, by a bayonet thrust, which opened the right knee joint. He received not less than fourteen other stabs in different parts of the body, none of them implicating the great cavities. He was taken prisoner, and conveyed to Richmond and placed in hospital. One of his wounds involved the left testis, which was removed on July 24th. On October 28, 1861, his right thigh was amputated at the middle, on account of disease of the knee with abscesses in the thigh. The double-flap method was employed. The stump became inflamed and the femur protruded. An inch of the bone was resected and the flaps were again brought together. In the spring of 1862 the patient was exchanged and sent to Fort Monroe. Thence he was transferred to a Washington hospital, and thence, in March, 1862, to his home in Brooklyn. There was necrosis of the femur, and in May, 1862, its extremity was again resected by a civil surgeon. On October 28, 1863, Francis was admitted to the Ladies' Home Hospital, New York. Necrosis had apparently involved the remaining portion of the femur. On May 21, 1864, Surgeon A. B. Mott, U. S. V., laid open the flaps and exarticulated the bone. The patient recovered rapidly and had a sound stump. He was discharged August 12, 1864. On October 1, 1865, a photograph, from which the accompanying wood-cut (FIG. 113) was taken, was forwarded by Surgeon A. B. Mott to the Army Medical Museum. Dr. Mott reported that the pathological specimen of the exarticulated femur was stolen from his hospital. For some months after his discharge Francis enjoyed good health; but then the cicatrix became unhealthy, pus was discharged through several sinuses, and there was bleeding from the slightest irritation. In March, 1867, a messenger was sent to his residence, 54 Hamilton Street, Brooklyn, and found him in very poor health. He had been unable to leave the house since November, 1866. On April 12, 1867, he was visited by Dr. E. D. Hudson, who reported him as then confined to his bed. There was a large ulcer at the upper outer angle of the cicatrix, which communicated with extensive sinuses; there was a fistula-in-ano also. The pus from the different fistulous orifices was thin, oily, and ichorous. There could be little doubt that there was disease of some portion of the innominatum. The patient was much emaciated, and had a cough with muco-purulent expectoration. His pulse, however, was not frequent, and he had a good appetite. In May, 1867, it was reported that his general condition had somewhat improved. In March, 1868, Pension Examiner J. C. Burdick, of Brooklyn, reported that this pensioner was "permanently helpless and required the constant aid of a nurse." On May 30, 1874 (Decoration Day), and the day prior, at a preparatory parade of the veterans of his regiment, he was particularly active. The day after this unusual exercise, May 31, 1874, he died suddenly while at table.[2] This statement from the Brooklyn *Union*, June 1, 1874, is corroborated by the records of the Pension Bureau.

FIG 113.—Cicatrix sixteen months after a reamputation at the right hip, succeeding amputation for a bayonet stab through the knee.

[1] OTIS (G. A.), *Case of Reamputation at the Hip*, in *American Jour. Med. Sci.*, 1871, Vol. LXI, p. 141. *Circular* No. 3, S. G. O., 1871, p. 215. In the account of Fabry's case, first published in the *American Journal of Medical Sciences*, 1871, Vol. LXI, p. 141, it is stated that the left leg was first amputated by Surgeon G. W. JACKSON, 53d Pennsylvania; again through the joint, August 23d, by Acting Assistant Surgeon W. F. ATLEE; and again on August 28th, by Acting Assistant Surgeon J. B. ROE. These statements were taken from the patient's written statements and from the artificial limb statement of Jewett's Leg Company. The original casualty list of the 2d Artillery Brigade of the Army of the Potomac and the case-book of the City Point Base Hospital of the Second Corps show conclusively that the first amputation was done August 17, 1864, at the lower third of the left thigh, by Surgeon G. L. POTTER, 145th Pennsylvania, and that the subsequent occasions of operative interference were ball extractions or incisions.

[2] *Circular* No. 6, S. G. O., 1865, p. 49. *Circular* No. 7, S. G. O., 1867, pp. 52, 65. HAMILTON (F. H.), *Treatise on Military Surgery*, 1865, p. 629.

CASE 332.—Private Eben E. Smith, Co. A, 11th Maine, aged 19 years, was wounded August 16, 1864, at Deep Bottom. A musket ball passed through the right leg from within outward, fracturing the head of the tibia. The wounded man was conveyed to a field hospital of the Tenth Corps, where it was determined that an attempt should be made to preserve the limb. Constant cold applications were made to the wounds. After a few days, the patient was sent to the North on a hospital steamer, and, on August 22d, he was received at the hospital at Beverly, New Jersey. On admission he suffered but little pain, though the knee joint was considerably swollen. On September 14th secondary hæmorrhage occurred, and it was deemed advisable to remove the limb. The amputation was performed by Acting Assistant Surgeon J. C. Morton, at the lower third of the thigh, by the circular method, the patient being anæsthetised by chloroform. On examining the seat of the injury, it was found that a fissure ran through the external tuberosity of the tibia and the external articular surface, and that the bone was carious in the vicinity of the fracture. The specimen was forwarded to the Army Medical Museum by Assistant Surgeon C. Wagner, U. S. A., and is represented in the wood-cut (FIG. 114). The case progressed favorably until October 17th, when there was hæmorrhage from the stump to the amount of twelve ounces. The stump was in a sloughing condition, and it was therefore determined to tie the femoral artery in Scarpa's space, which was done by Dr. Morton. The ligature came away on November 1st. The wound remained in an unhealthy condition, with a copious fetid suppuration, and the necrosed extremity of the femur protruded from the upper angle of the wound. On November 5th, the soft parts were retracted, and four inches of the shaft of the femur were resected by the chain saw. After this the stump became much swollen, frequent abscesses formed, and it was finally decided that necrosis involved the femur quite up to the trochanters. This conclusion was verified by an exploratory incision made on January 19, 1865, when it was determined to proceed at once to amputate at the coxo-femoral articulation. The operation was performed by Acting Assistant Surgeon John H. Packard. The patient being already under the influence of chloroform, the femoral artery was exposed and tied just below Poupart's ligament. Anterior and posterior flaps were then formed and disarticulation effected. Some difficulty was experienced in securing an artery supposed to be the *comes nervi ischiadici;* but the quantity of blood lost in the operation was not considered large. There was extreme depression after the operation, and the patient was kept on the amputating table for two or three days, lest an attempt at removal should prove fatal. Large quantities of stimulants and concentrated food were administered, and artificial warmth was applied to the surface of the body. Eight days after the operation hæmorrhage to the extent of six ounces occurred, and a ligature was placed upon the external iliac artery by Dr. J. C. Morton. The ligature separated on February 17th. On the 19th there was profuse bleeding from the point of ligation, which was controlled by pressure. Direct compression was maintained for fourteen days. After this the patient rapidly improved, and by the end of March he was quite well. On April 12th, Smith was transferred to the White Hall Hospital, near Bristol, Pennsylvania. On May 27, 1865, Assistant Surgeon W. H. Forward, U. S. A., reported his discharge from service with a sound stump and robust health. After his discharge Smith went to his home at Eastbrook, Maine, and was granted a pension. On February 27, 1867, he wrote to this office that his general health was excellent, but that the cicatrix of his stump was painful. In May, 1867, he was admitted to the eastern branch of the U. S. Military Asylum for disabled volunteer soldiers, at Togus Springs, near Augusta, Maine. On May 12th, the surgeon of the asylum, Dr. B. B. Breed, wrote that he "was apparently in perfect health, and complained only of congestion of the stump after standing for some time." In July, 1867, Dr. Breed forwarded photographic prints representing the condition of the cicatrix two and a half years after the amputation at the hip, from one of which the adjoining photograph (FIG. 115), is copied. An attempt was proposed to adapt an artificial limb to the stump. The exarticulated portion of the femur was forwarded to the Army Medical Museum by Assistant Surgeon C. Wagner, U. S. A. It is represented in the adjacent wood-cut (FIG. 116), and shows a fragile involucrum and sequestrum about to separate extending quite to the epiphysis. Pension Examining Surgeon P. H. Harding, of Ellsworth, Maine, reports, in 1867, that the pensioner's health has become poor, and that he is unable to do any manual labor. On December 4, 1874, Dr. G. Parcher, of Ellsworth, certifies "that, in consequence of the extensive and tender cicatrix, the pensioner cannot sit to work at any trade or to write, and as he cannot wear an artificial limb, he can perform no labor in an erect position." June 4, 1878, this pensioner alleged no further disability.[1]

CASE 333.—Sergeant E. D. Ulmer, Co. G, 15th New Jersey, aged 21 years, was wounded at Cedar Creek, October 19, 1864, by a musket ball, which entered the inner face of the left thigh, fractured the bone, and lodged under the skin on the outer side of the limb. The femur was badly comminuted, fissures extending into the knee joint and upward for seven inches (FIG. 117). The ball was extracted at a field hospital of the Sixth Corps, and it was determined to attempt to save the limb. The wounded man was conveyed to Baltimore, to Jarvis Hospital, on October 24th. Intense arthritis supervened, with deep dissecting abscesses in the thigh. On November 14th hæmorrhage to the extent of twenty-five ounces took place from both orifices, which were in a sloughing condition. The patient was put under ether, and amputation at the middle of the thigh was performed by Acting Assistant Surgeon Edmund G. Waters. The patient rallied promptly after the operation, and in a few weeks was able to get about on crutches. Yet the stump continued painful, and the extremity of the femur was found to be necrosed. In March, 1865, it was found that a cylindrical sequestrum was loose. This was removed, on March 8th, by Acting Assistant Surgeon B. B. Miles, with forceps (FIG. 118). On May 29, 1865, he was discharged. On the following day he started for Philadelphia, and, unfortunately, on the journey he fell with violence upon the stump. After this there was increased suppuration, with deep-seated pain in the stump. On the 22d of January, 1866, fifteen months after the original injury, while dressing the part as usual, a hæmorrhage occurred from one of the fistulous openings at the end of the stump, amounting, according to his statement, to at least a pint. On account of this hæmorrhage, he was admitted into the Pennsylvania Hospital. The history of the case and the appearances of the stump clearly indicated the existence of osteomyelitis, with necrosis of the neck, and probably ulceration of the head of the bone. The risk of recurrence of dangerous hæmorrhage, and the extensive disease of the femur, obviously demanded operative treatment. On February 17, 1866, in the hospital amphitheater, the patient being etherised, an exploratory operation was made by Dr. Thomas G. Morton, the attending surgeon, and amputation was decided upon by him in consultation with Drs. W. Hunt and D. H. Agnew. The abdominal tourniquet, used the first time in this country by Professor Joseph Pancoast, June, 1860, was applied, and antero-posterior integumentary flaps were dissected up; the femoral artery was then tied, the muscles cut circularly, and the head of the bone was disarticulated. The aorta was so completely controlled by the abdominal tourniquet that no arterial jet was observed during the operation. About sixteen ligatures were applied. The flaps were approximated with adhesive plaster, no sutures being deemed necessary. The dressings consisted of lint soaked in pure laudanum. The patient reacted well; under vigorous stimulating treatment and the local application of permanganate of potash he rapidly recovered. He left the hospital March 27, 1866, for his home in Philadelphia. The exarticulated portion of the femur presented a characteristic example of necrosis following osteomyelitis. A long loose sequestrum was found encased in a new deposit of porous bone, and was not limited to the diaphysis, but extended quite into the neck, and then projected through the ulcerated capsular ligament. The head of the femur was ulcerated. The acetabulum was healthy. On May 10, 1866, the patient was able to get about on crutches. On the 20th, he left for New Jersey to fill a situation as telegraph operator. On July 24, 1866, he sent a letter to this office from Milford, New Jersey, announcing that his health was excellent, and a few weeks subsequently he corroborated this statement by transmitting his photograph (FIG. 119). On October 27, 1866, he was supplied with an artificial limb by Clement, of Philadelphia. On June 28, 1867, Mr. Ulmer wrote to this office that he had never had a day's illness since the hip joint amputation was performed, and had never been in better health than then. He was stouter than ever before, weighing one hundred and seventy-five pounds, or twenty-five more than his average weight when he had both lower extremities. His stump was firm and solid and gave him no pain or inconvenience. He considered his artificial limb an excellent one, but found it inconvenient at his work, which required him to sit all day on a high stool. In a letter addressed to the Surgeon General's Office from the publishing house, 1630 Wellington Street, Philadelphia, October 15, 1878, Mr. Ulmer reported his health as most excellent, his weight at 173 pounds, or 25 pounds more than before exarticulation. He had an artificial limb from Clement, but had to abandon it.[1]

CASE 334.—Private *R. A. Vick*, Co. E, 43d North Carolina, aged 37 years, received a shot wound of the knee joint, at Cedar Creek, October 19, 1864, and underwent primary amputation at the lower third of the right thigh. On December 19th, he was sent to the hospital at Staunton. On January 1, 1865, the stump had almost cicatrized, but there were apertures through which pus issued. On February 15, 1865, an exploration with a silver probe revealed bone denuded of periosteum and roughened. Another aperture led to a somewhat superficial fistulous track of six or eight inches. It was determined to open the face of the stump, with a view to the removal of the diseased bone. The operation was performed on March 11, 1865, by the surgeon in charge of the hospital, Dr. A. M. Fauntleroy, assisted by Drs. T. W. Glocker and R. K. Carter. Chloroform was administered. A transverse incision was then made over the face of the stump. At the exposed extremity of the femur was a redundant mass of new bone, which was sawn off. It was then found that the carious shaft of the bone was encircled by a soft porous osseous deposit. About six inches of this formation was stript off by the gouge, yet the limits of morbid action had not been reached. An incision on the outer side of the thigh, between the vastus externus and biceps, was extended upward to a point between the great trochanter and the anterior iliac spine, and revealed the fact that the entire femur was diseased. It was now decided to disarticulate at the hip joint. The femoral artery was compressed upon the pubic bone and anterior and posterior flaps were formed, the arteries being secured as they were cut. The loss of blood was trifling. The flaps were brought together by silver sutures, and the stump was dressed with dry lint. As soon as consciousness was restored the patient was freely stimulated, and warmth was applied to the surface of the body; the patient rallied in a few hours. At bed-time the pulse beat 120. On the following morning the patient was doing well. Pulse still the same in quickness and frequency. On March 13th, his condition was satisfactory; his appetite was remarkably good; he ate soft-boiled eggs and drank largely of rich milk. Suppuration having commenced, cold water was directed to be constantly applied to the stump to lessen the secretion of pus. He was ordered twenty drops of the tincture of the sesquichloride of iron thrice daily, and ten grains of Dover's powder at bed time. Suppuration amounted to half a pint during the day. On March 20, 1865, he was still doing well. Suppuration was diminished in quantity and was laudable. Sutures were removed, and adhesive strips used to support the flaps and maintain them in apposition. The patient's bowels had been regular since the operation. His tongue had at no time been furred. The stump was doing well. The discharge had abated to three or four ounces. March 28th, the progress of the patient was highly favorable. March 29th, the patient's condition was comfortable and favorable; his appetite continued good. The stump along the lower surface seemed to have united firmly; on the side, granulations were healthy; the pus discharged was laudable. On April 24th the face of the stump had entirely healed. There was still a granulating sore at the outer angle. On July 18, 1865, the patient started for his home, near Tarborough, in Edgecomb, North Carolina. He was in excellent health, and walked about on crutches with facility. A year subsequently he was in Lynchburg, Virginia. Since that date no intelligence has been received from him, and it is not known whether he still survives.[1] Dr. A. M. Fauntleroy, the operator, courteously transmitted to the Surgeon General's Office a photograph of the diseased exarticulated femur, which is copied in the wood-cut (FIG. 121), and the photograph of the patient and of his stump sixteen months after the operation, July, 1866, which is represented in the wood-cut, FIG. 122.

FIG. 121.—Exarticulated carious femur. [From a photograph sent by Dr. FAUNTLEROY.]

FIG. 122.—Cicatrix sixteen months after reamputation at the right hip. [From a photograph.]

CASE 335.—Henry Campbell, aged 23 years, received, in March, 1863, at New Orleans, a pistol shot in the left knee. Primary amputation at the junction of the middle and lower thirds of the thigh was performed by Acting Assistant Surgeon Avery. Osteomyelitis supervened and resulted in necrosis. After a few months the patient was removed to his home in Connecticut. In October, 1864, eighteen months subsequent to the injury, he was visited by Dr. Bauer, of New York, who laid open the cicatrix, crowded with fistulous openings, and removed a cylindrical sequestrum five inches in length. For a few months after the removal of this sequestrum the health of the patient improved, and hope was entertained of his recovery without further operative interference; but persistent pain and constitutional disturbance then recurred with augmented intensity. The lower part of the stump was riddled with sinuses and the tissues were much indurated. The probe detected dead bone, or morbid bone formation, in every direction. In October, 1866, the medical attendants resolved that an operation should be performed for the radical removal of the diseased bone. It was hoped that it would be only necessary to remove a portion of the shaft of the femur. On October 22d, the patient was placed under the influence of chloroform, and Dr. James B. Whitcomb, assisted by Dr. Charles Bliss, of Willimantic, and others, proceeded with the operation. An exploratory incision was made on the outside of the thigh, extending quite up to the trochanter. On exposing the new osseous formation at the end of the stump it was found to be more than twice the normal diameter of the shaft of the femur, rough, porous, and fragile. The immensely thickened periosteum was studded with plates and spines of new bone, and in many cases there were foliaceous masses of callus unconnected with the shaft. Toward the upper extremity of the femur the periosteum appeared less diseased,

[1] FAUNTLEROY (A. M.), *Hip Joint Amputations*, in *Richmond Medical Journal*, 1866, Vol. I, p. 7. EVE (P. F.), *Contribution to the Hip Joint operations performed, etc.*, in *Trans. Am. Med. Ass'n*, 1867, Vol. XVIII, p. 254. *Circular* No. 7, S. G. O., 1867, pp. 50, 65. LÜNING (A.), *loc. cit.*, p. 103, CASE 368.

but the bone was found to be softened and disorganized quite up to the great trochanter. It was therefore decided to amputate at the hip joint. Ether was administered. Pressure with the thumb on the femoral artery served to control the hæmorrhage. A large antero-internal flap was formed and disarticulation effected. There was very little loss of blood, but the patient was greatly prostrated by the shock of the operation, which, from the beginning of the exploration to the completion of the amputation, lasted fifty minutes. The free administration of ammonia and brandy brought about reaction; but it was temporary, and the case terminated fatally, five hours after the operation, October 22, 1866.[1]

CASE 336.—Private Lewis Larry, Co. A, 1st New Orleans Regiment, aged 23 years, was shot through the left knee by a sentry, July 18, 1864, while attempting to avoid arrest. He was carried to the University Hospital. It was found that the condyles of the femur were badly comminuted. Synovial fluid was dribbling from the wound, with little hæmorrhage. Amputation at mid-thigh was promptly performed, under chloroform, by double flaps. The patient did well for about three weeks, when he was attacked with persistent diarrhœa. Erysipelas now attacked the stump. Sloughing phagedæna of the flaps ensued, and purulent sinuses extended upward along the femur, the necrosed extremity of which protruded from the stump. Amputation at the hip joint was performed by Acting Assistant Surgeon F. Hassenburg, on September 21, 1864. The patient was under the influence of chloroform. The artery was controlled at the groin, an anterior flap was formed by transfixion, the capsule divided and disarticulation effected, and a posterior flap cut from within outward. The hæmorrhage was inconsiderable, and the patient promptly rallied from the shock of the operation. For a few days his appetite and general health improved; then the wound assumed an unhealthy aspect, and finally sloughed. Symptoms of pyæmic infection set in, and death ensued on September 30, 1864. On dissecting the removed portion of the thigh it was found riddled with abscesses. The periosteum was enormously thickened and contained flaky ossific deposits. The shaft of the femur was necrosed up to the trochanters, the dead bone being included in a redundant friable involucrum. The preparation was forwarded to the Army Medical Museum by Surgeon Samuel Kneeland, U. S. V.[2]

FIG. 123.—Diseased stump of femur from a case of coxo-femoral disarticulation. *Spec.* 3738, A. M. M. $\frac{1}{4}$

CASE 337.—Charles H. Hawkins, a second lieutenant in Co. C, 4th New York Cavalry, aged 23 years, was wounded in a reconnoissance near Strasburg, Virginia, on the night of June 1, 1862. A conoidal ball, from a Colt's cavalry pistol, entered the posterior surface of the right thigh, and, passing downward and forward, fractured the femur at the lower part of the middle third, and lodged under the skin about five inches above the knee. The wounded man lay out all night in the rain, and in the sun next day until three in the afternoon, when he was brought into camp and had the ball removed by his regimental surgeon. He was then conveyed in an ambulance to a hospital in Strasburg, where his limb was dressed with a straight splint, moderate extension and counter-extension being maintained. After ten days he was carried on a stretcher to a private house, where he remained seventeen days. Two fragments of bone were extracted during this period. He was next transferred to a tent hospital, five miles distant, near Middletown, and after a sojourn of nine days was again transferred to a hospital at Winchester. The splints were removed and the limb was bandaged. On July 19th he was conveyed to Baltimore, and admitted to the Camden Street Hospital on July 20th. His condition was very unpromising; there was much irritative fever, a copious suppuration, and partial union of the fracture, with three inches shortening and much angular deformity. No apparatus was applied; but the limb was maintained in an easy position by pillows, and attention was mainly directed to improving the condition by wholesome diet. Two months subsequently the patient had gained ground, and an operation to remove the diseased bone and to break up the faulty union of the fragments was determined on. On October 1st, the posterior orifice was enlarged, a number of denuded fragments of bone were removed by forceps, and the deformed callus was chiseled and gouged away. Temporary improvement ensued. The limb was put in a proper position and the wound was daily syringed out by iodine injections. After a time, however, it became manifest that the broken extremities of the femur were still diseased. On April 5, 1863, the patient was transferred to the Ladies' Home Hospital, New York City, where he was received on April 8th, greatly reduced in strength. The wounds discharged profusely, and he complained of much pain. On April 29th, Surgeon A. B. Mott, U. S. V., amputated the limb at mid-thigh. Evidence that the femur was diseased above the point at which it was sawn soon became apparent, and, after a protracted effort to induce healthy action, the flaps were freely laid open and the femur was resected, four inches of the shaft being removed. After this the patient was put upon a full diet, with an allowance of brandy and of porter daily. The stump still failed to assume a healthy action, but became much enlarged, undergoing apparently a fatty degeneration. On April 4, 1864, Lieutenant Hawkins was mustered out of the military service, and was transferred to St. Luke's civil hospital, and came under the care of Dr. Gurdon Buck. The patient was anæmic, his appetite capricious; he was compelled to keep his bed continually on account of the pain he suffered when the stump was in a dependent position. For over five months every means were used to bring the patient up to a condition in which an operation for the removal of the diseased femur stump might be safely undertaken. On September 21st, he was placed under the influence of sulphuric ether, and Dr. Buck proceeded to disarticulate. It was found necessary to bisect the stump, uncovering the neck of the bone on the inner as well as the outer aspect, by an incision which commenced above the great trochanter and ran around the extremity of the bone to near the tuberosity of the ischium. During the operation the administration of ether was suspended on account of the extreme feebleness of the circulation, and brandy was freely given, and warm applications were made to the trunk. The loss of blood was not great, but every possible means had to be called into requisition to bring about a partial reaction after the operation, so great was the prostration and so feeble the recuperative powers. After twenty-four hours of great apparent suffering, the patient died in a syncope, September 22, 1864. The portion of the femur removed consisted of the head, neck, and trochanters, with four inches of the shaft. The head and neck were much softened and the shaft was atrophied and fatty.[3]

TABLE XVIII.

Summary of Nine Cases of Reamputation at the Hip Joint.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
1	Cotter, W., Pt., E, 9th New Hampshire, age 27.	July 30, 1864.	Musket ball fract. lower third right femur; prim. amp. thigh, mid. third. Nov. 29, '64, seq. rem.; osteomyelitis. June, '66, exc. four inches end of stump. Subsequent operation rem'd dead bone.	Oct. 15, 1871.	Reamp. thro' extend'g incision of later operation upward sufficiently to allow ready exarticulation of head, neck, and trochanteric portion of femur, by Dr. N. S. Lincoln, Washington, D. C.	April, 1872, w'd cicatriz'd firmly. 1873, abscesses unhealed; constant irritation. Died Jan. 21, '74. *Specs.* 252, 4954, 5946. *Photos.* 61, 180, 324. OTIS (G. A.), in *Boston Med. and Surg. Jour.*, Feb. 7, '78, Vol. XCVIII. p. 166, and *Circular* 3, S. G. O., Washington, 1871, p. 283.
2	Fabry, J., Pt., Battery K, 4th Artillery, age 38.	Aug. 16, 1864.	Shrapnel shot wound left knee joint; prim. amp. lower third thigh. Aug. 28, ball and pc. of fuse ext.; necro.; abscesses opened. 1866, discharge profuse; exfol. fistulous open'gs. Oct. 27th, dead bone removed. 1867 to 1870, abscesses cont'd to form and dead bone to exfo.	May 15, 1870.	Long semi-lunar flap; incision from point on tuberosity of ischium to point midway between ant. sup. spin. process of ilium and troch. major, by Ass't Surg. G. A. Otis, U. S. A.	Reaction prompt. May 18th, w'nd united nearly $\frac{3}{4}$ full extent by first intention. June 5th, about on crutches. July 13th, completely cicatrized. *Specs.* 5684, 5685, 5687, 5699, 5702. *Photos.* 274, 275, 276.
3	Francis, L., Pt., 1, 14th New York State Militia, age 42.	July 21, 1861.	Bayonet thrust opening right knee joint (14 other bayonet stabs); gangrene; extensive abscess on thigh. Oct. 28th, amp. mid. third thigh. Nov. –, femur protruded; exsected. May, 1862, necrosed end of femur exsected.	May 21, 1864.	Antero-posterior flap reamputation at hip joint, by Surg. A. B. Mott, U. S. V. (Bone found extensively diseased close up to head.)	Rapid recovery: stump sound. 1867, confined to bed; copiously discharging ulcer, fistula in ano. 1870, about on crutches, stump apparently healed. Died, May 30, 1874, suddenly.
4	Smith, E. E., Pt., A, 11th Maine, age 19.	Aug. 16, 1864.	Musket ball fract. head of right tibia. Sept. 14th, hæm.; amp. low. third thigh. Sept. 17th, hæm.; lig. fem. Nov. 5th, necrosis; four ins. end of femur resected; frequent abscesses.	Jan. 19, 1865.	Anterior and posterior flap amputation at hip joint, by A. A. Surg. J. H. Packard. (Femur found necrosed up to trochanters.)	Extreme depression. Jan. 27, '65, hæm.; lig. external iliac artery. Feb. 19th, hæm.; compression. Disch'd May 27, 1865, sound stump. *Specs.* 81, 3709. *Photos.* 29, 174, 203.
5	Ulmer, E. D., Serg't, G, 15th New Jersey, age 21.	Oct. 19, 1864.	Conoidal ball com'nuted fract. left femur, fissures extending into knee j t and upw'd seven inches: ball ext. Nov. 14th, hæm.; amp. mid. third. Mar., '65, seq. removed. Jan., '66, hæm. from end of stump; osteomyelitis.	Feb. 17, 1866.	Anterior and posterior flap amputation at hip joint, by Dr. T. G. Morton, Penn. Hospital. (Bone diseased as high as neck.)	Rapid recovery. Left hospital March 27, 1866. 1877, continues in good health; stump in healthy condition. *Specs.* 107, 3734.
6	*Vick, R. A.*, Pt., E, 43d N. Carolina, age 37.	Oct. 19, 1864.	Shot wound right knee joint; prim. amp. lower third thigh. Jan. 1, '65, almost cicatrized. Feb. 15th, increased disch'rge of pus. Exploration revealed entire femur diseased.	Mar. 11, 1865.	Anterior and posterior flap amputation, by Surg. A. M. Fauntleroy, C. S. A., assisted by Drs. T. W. Glocker and R. K. Carter.	April 24, 1865, stump entirely healed. Last heard from July, 1866, in excellent health.
7	Campbell, H., Sutler's Cl'k, age 23.	Mar. —, 1863.	Pistol shot in left knee; prim. amp. junct. low. thirds thigh; osteomyelitis; necrosis. Oct., 1864, seq. removed; stump riddled with sinuses.	Oct. 22, 1866.	Large anterior internal flap, by Dr. J. B. Whitcomb. (New osseous formation at end of stump was twice the diameter of shaft of femur; bone soft and diseased up to troch.)	Died October 22, 1866, five hours after operation.
8	Hawkins, C. H., Lieut., C, 4th New York Cavalry, age 23.	June 1, 1862.	Conoidal pistol ball fract. mid. third right femur; ball extr'd. July 20th, bone partially united. Oct. 1st, fragments and calloused bone removed. Apr. 29, '63, amp. mid. third; exc. four inches of femur.	Sept. 21, 1864.	Tissues of stump indurated and inelastic; stump bisected by an incision commencing above great troch., running around end of bone to near tuberosity of ischium: antero-posterior flap, by Dr. G. Buck.	Only partial reaction. Died September 22, 1864, in a syncope, after twenty-four hours of great apparent suffering.
9	Larry, L., Pt., A, 1st New Orleans, age 23.	July 17, 1864.	Shot wound left knee comminuting condyles of femur; prim. amp. mid. third thigh; erysip. attack'd stump, flaps slough'd, necrosed end bone protruded.	Sept. 21, 1864.	Anterior flap formed by transfixion, posterior flap cut from within outward, by A. A. Surg. F. Hassenburg.	Rallied promptly; wound became unhealthy and sloughed. Died Sept. 30, 1864; pyæmia. The shaft of femur was necrosed up to trochanters. *Spec.* 3738.

These nine cases of reamputation at the hip comprise only three deaths, giving the low mortality rate of 33.3 per cent. In three instances the exarticulation had been preceded by amputation in the lower third of the thigh, and, in six cases, the disarticulation was subsequent to amputation in the middle third of the thigh. In two of the cases the prior amputation was done on account of shot fracture of the shaft of the femur, in six for shot fractures involving the knee joint, and, in one, for a bayonet stab of the knee. In six instances extraction of sequestra or resection of the necrosed extremity of the femur had been practised in the interval between the amputation in the continuity and the disarticulation. In the three fatal cases the prior amputation had been primary in two instances; secondary in the third case. One patient survived the shock of the operation only a few hours; another died in a syncope after twenty-four hours of great apparent suffering, and

the third succumbed to pyæmia eight days after the exarticulation. Of the six patients who survived the operation, three, J. Fabry (CASE 330), E. E. Smith (CASE 332), and E. D. Ulmer (CASE 333), were living in August, 1879. Of the Confederate soldier, Vick (CASE 334), no information has been received since 1866, and it is not known whether he still lives. Two survivors of the operation have since died: Cotter (CASE 329), in 1874, two years and three months after the operation; Francis (CASE 331), in 1874, over ten years after the exarticulation.

The nine cases cited in TABLE XVIII, and the operations performed by G. J. Guthrie,[1] in 1812, and by T. G. Morton,[2] in 1878, are, it seems, the only recorded examples of reamputations at the hip in military surgery. From the records of the surgery of civil life twenty-five cases may be collected, making a total of thirty-six[3] exarticulations at the hip after previous amputations in the thigh, with fourteen deaths, a mortality of 38.8 per cent. Of the eleven cases in military surgery, four, or 36.3 per cent., proved fatal, while, of the twenty-five operations in civil practice, ten, or 40.0 per cent., had a fatal termination.

Summing up the sixty-six cases of amputation at the hip detailed in the preceding pages, it will be seen that twenty-five were primary, twenty-three intermediary, nine secondary, and nine were reamputations. In each of the twenty-five primary cases the amputation was performed within twenty hours of the infliction of the injury, the average interval between the reception of the wound and the operation being about four hours. Sixteen died within twelve hours, one survived thirty-six hours, two about forty-eight hours, and one lingered eight days; in two instances the period between the operation and death could not be ascertained; the average period of death being about twenty hours. Of the three survivors after primary amputation at the hip, one was in comfortable health over fifteen years after the operation; the other two patients were heard from two and six months, respectively, after the date of the operation, but the hope expressed in *Circular* No. 7, at page 23, that the subsequent histories of these men might be traced has not been attained; and there might be some question regarding the justness of citing these cases as well authenticated instances of recovery. In TABLE XIV, on page 127, *ante*, these cases have been classed among the recoveries, thus arriving at a fatality of 88.0 per cent. Should they be excluded, the fatality of the primary amputations at the hip during the war of the rebellion would be 95.6 per cent. The femoral vessels were torn in six of the primary amputations, to wit: Compton's case (273) of *Robinson;* Carnochan's case (280) of Gordon; Lay's case (284) of a private of the 3d Missouri, in which the femoral artery was ligated prior to amputation; Brock's case (286) of Waters, in which the opposite leg was also amputated at the point of election; Davis's case (287) of Wayland, and Lanning's case (289) of Brookins.

The twenty-three intermediary exarticulations at the hip had fatal results. The interval between the reception of the injury and the date of the operation varied from twenty-four hours to thirty days, the mean length being a little over nine days. Only two survived

[1] See CASE 12 in *Note* 1 on page 128, *ante.* [2] See CASE 184 in *Note* on page 130.

[3] In note 1 on page 152, *ante*, reference was made to 32 instances of exarticulation at the hip after previous amputation in the continuity of the thigh. The prior operations had been performed in 9 instances for shot injury, in 2 for punctured and incised wounds, in 5 for bad fractures of the femur, in 8 for ostitis or ill defined lesions, and in 8 for malignant growths. Particulars of 4 additional instances have since been ascertained, viz: three exarticulations at the hip after amputations in the thigh for ill defined lesions: E. S. O'GRADY, in 1874 (*Dublin Journal of Med. Sciences*, 1876, Vol. LXI, p. 78); T. G. MORTON, in 1877 (*Cincinnati Lancet and Clinic*, 1879, Vol. II, N. S., p. 9, and letter of Dr. T. G. MORTON to the editor, dated February 19, 1879); B. BECK, in 1878 (*Archiv für Klin. Chir.*, Berlin, 1879, B. XXIII, p. 654); and a reamputation at the hip by T. G. MORTON, in 1878: Boasso Dominico (not Dominico Ludovess, as indicated in CASE 184 in note on p. 130, *ante*), aged 24; wounded in the right thigh, by a cannon ball, at Sedan, in 1870; amputation in middle third; reamputation at hip, December 14, 1878. Recovery (*Cincinnati Lancet and Clinic*, 1879, Vol. II, N. S., p. 9, and Dr. T. G. MORTON'S letters to the editor, dated February 19, March 18, and May 28, 1879). Of the 36 reamputations at the hip, 14 had a fatal termination, a mortality of 38.8 per cent.

the amputation eight days; nine died within the first twenty-four hours, four on the second day, one on the third, three on the fourth, two on the sixth, and in two, the date of death could not be ascertained; the average duration of life after the operation in the intermediary series was only about thirty-five hours. In four instances gangrene, and, in two, pyæmia, supervened. In one case (Surgeon P. Pineo's case of Private P. Johnson, CASE 306, p. 141, *ante*) it is stated that the femoral artery was divided by the missile, and in one (Surgeon E. Bentley's case of L. Carroll, CASE 298, p. 139, *ante*) the amputation had been preceded by a primary partial excision in the shaft of the femur.

Of the nine secondary amputations at the hip, two resulted successfully. George W. Lemon (CASE 320, p. 145, *ante*) enjoyed good health in 1879, nearly fifteen years after the operation. In the case of the Confederate soldier *W. W. Longmoor* (CASE 321, p. 146, *ante*), the following additional information was received shortly after the case had been sent to press:

CASE 321, p. 146 (continued): Mr. Longmoor, who, at the present writing, is clerk of the court at Cynthiana, Kentucky, writes, under date of April 2, 1879: "I have had two abscesses form in my stump, * * the first one was very severe indeed, and kept me confined to my bed for several weeks, and discharged copiously for about one week of that time. The next and last abscess was not near so severe, and did not confine me to my bed for more than about two weeks. The discharge was not near so great, and the pain accompanying the formation not near so severe. I have a *constant* pain in my stump; an uneasy, restless sort of a pain that never ceases but is always with me—at times much worse than others, and often taking the form of neuralgia, especially before or during damp or falling weather. I suffer a great deal from neuralgia—acute, very acute, lasting generally four or five days; sometimes compelling me to leave my office, at which times I usually resort to heavy doses of quinine. I use morphine every day. I take about one-fourth of a grain three times a day—have been doing this ever since I was wounded. During these times my stump becomes very sore, and hurts me when I walk. I have never been able to wear an artificial limb, in fact have never tried, knowing its utter impossibility, for I could not bear the weight of the limb much less the pressure on the stump."

Of the seven fatal cases after secondary amputation at the hip, one patient died from phthisis and lithiasis, one from secondary hæmorrhage and phlebitis, one from the giving away of the femoral artery at the point of ligation, one from surgical fever and erysipelatous inflammation of the stump, and three from the shock of the operation. The shortest interval between the operation and the date of death was one hour, the longest one hundred and nineteen days, the average duration of life being a little above twenty-two days. The average interval between the date of injury and the date of operation was about four hundred and twenty-nine days, the shortest interval being forty-three days, the longest two years, nine months and twenty-one days.

The sixty-six exarticulations at the hip were practised in forty-five instances with seven recoveries on Union soldiers, in twenty instances with four recoveries on Confederate soldiers, and, in a fatal instance, on a citizen employé. In twenty-nine instances with six recoveries, the right limb was removed; in twenty-eight with five recoveries, the left; and, in nine, the side was not stated. Chloroform was the anæsthetic administered in thirty-eight of the sixty-six cases, ether in ten, chloroform and ether in three. In one instance (Dr. B. D. Lay's CASE 284, p. 135, *ante*), stimulants and morphia only were given, and in fourteen instances this point is not mentioned. Considering the ages of the patients we find that three operations, performed on patients under twenty, were fatal; that of thirteen operations performed on patients between the ages of twenty and twenty-four inclusive, three were successful; of ten between the ages of twenty-five and twenty-nine inclusive, two had a successful issue; of seven between the ages of thirty and forty, four recovered; and of four above forty, two had a successful termination. In twenty-nine instances the age of the patient was not recorded.

Fragments or splinters of bone were removed prior to the exarticulation at the hip

joint in the cases of *W. W. Longmoor* (CASE 321, p. 146, *ante*) and of M. O'Neil (CASE 327, p. 150, *ante*). The ball and detached fragments of bone were extracted in Bowman's case (CASE 322, p. 147, *ante*), and the ball, with some wadding, in the case of Antonio Mutieres (CASE 326, p. 150, *ante*).

Of the different modes of amputating at the hip joint, the operation by the antero-posterior flap method was most commonly selected. It was used in twenty-nine of the sixty-six cases of exarticulation at the hip described in the preceding pages, and in five of the eleven cases of recovery, viz: in Dr. E. Bentley's case of Lemon (p. 145, *ante*); in Dr. A. B. Mott's case of Francis (p. 154, *ante*); in Dr. J. H. Packard's case of E. E. Smith (p. 155, *ante*); in Dr. T. G. Morton's case of Ulmer (p. 156, *ante*); and in Dr. A. M. Fauntleroy's case of *Vick* (p. 157, *ante*). The single flap method was successfully employed in three instances: by Dr. Shippen in the primary case of Kelly (p. 131, *ante*), by Dr. J. T. Gilmore in the case of *Williamson* (p. 132, *ante*), and by Dr. G. A. Otis in the case of Fabry (p. 153, *ante*), and unsuccessfully in twelve cases. Drs. William M. Compton and G. C. Blackman adapted, with success, the circular method in the cases of *Robinson* (CASE 273, p. 132, *ante*) and *Longmoor* (CASE 321, p. 146, *ante*). Larrey's method of amputating at the hip by two lateral flaps was preferred in eight instances; the oval was employed only once, in Dr. J. M. Carnochan's case of Gordon (CASE 280, p. 134, *ante*). In Dr. N. S. Lincoln's successful operation at the hip, in the case of Cotter (CASE 329, p. 152, *ante*), the disarticulation resembled an excision or enucleation rather than a reamputation. The mode of operation is not indicated in ten instances.

Prothetic apparatus, that might in some measure compensate the survivors after hip joint amputation for the loss of the limb, and relieve them of the necessity of continually using crutches, have been devised by Charrière, Foullioy,[1] and others. In 1867, Dr. E. D. Hudson devised a lined and padded gutta-percha bonnet conforming to the entire ilio-lumbar parts, and some eight inches in length, firmly strapped to the pelvis by a broad chamois-lined canvas band. To this artificial stump an ordinary apparatus for thigh stumps could be fitted. This simple apparatus, which is fully described by Dr. E. D. Hudson in his pamphlet: *Mechanical Surgery*, New York, 1878, p. 29, was tried by Kelly and Lemon; but, although great hopes were entertained that it would answer the purpose for which it was designed, it seems that this, as well as similar appliances, have now been discarded as useless, even by those survivors who, at the first, were favorably impressed with their utility. Mr. Ulmer, who wrote to this Office in June, 1867, that he considered his "artificial limb an excellent one," in a letter dated October 15, 1878, states that after several attempts to wear the artificial limb he had to abandon it, "as it gave intense pain; the weight of the body pressing the top of the limb too severely against the pelvic bone. Another objection is the absence of motive power in the stump to propel the limb. As this has to be given by a swinging motion of the body, the effort is too fatiguing." James E. Kelly, under date of July 30, 1870, writes: "The leg I got from Dr. Hudson is of no benefit to me whatever, nor ever will be. I tried it sufficiently to know that I cannot wear it." Lemon advises this Office on July 31, 1870, that: "The artificial limb is not now nor ever has been of the least service to me." Longmoor has never tried an artificial limb as he "knew it would be useless." Fabry never attempted to wear one, and there is no record that

[1] See GAUJOT (G.) et SPILLMANN (E.), *Arsenal de la Chirurgie contemporaine*, Paris, 1872, T. II, p. 153. M. DEBOUT (*Appareils destinés aux amputés qui ont subi la désarticulation de la cuisse*, in *Bulletin Général de Thérapeutique Méd. et Chir.*, Paris, 1862, T. 62, p. 283) relates that Cauzeret, a soldier of the Light Infantry, on whom BAUDENS successfully performed intermediary amputation at the hip, in Africa, in 1836 (CASE 38, *Note* 1, p. 128, *ante*), wore the apparatus of Foullioy for 11 years, from March, 1837, to October, 1848.

Cotter, *Williamson*, *Robinson*, *Vick*, or Francis essayed a trial. In the case of E. E. Smith the cicatrix remained too tender to allow the wearing of an artificial limb.

While the preceding pages were in press, a report of an unsuccessful primary amputation[1] at the hip by Assistant Surgeon Edward B. Moseley, U. S. A., was received from Fort Robinson, Nebraska. This, with three additional cases given in the foot-note,[2] increases the total number of exarticulations at the hip to two hundred and fifty-four,

[1] "Private Bernard Kelley, Co. E, 3d Cavalry, aged 39, while in the field in pursuit of Cheyenne Indians, on January 11, 1879, was struck by a carbine ball (said to have been an accidental shot from one of his own company), which entered at a point just over the centre of the sacrum, half an inch to the left of the median line, passed downward and outward through the gluteal muscles, and struck the left femur just between the two trochanters, fractured it, and escaped from the front of the thigh about two inches above its middle, and an inch to the outside of the median line. He was brought to the post hospital at Fort Robinson the same day, and was found to be suffering from a high degree of shock; he was pale, cold, and weak from hæmorrhage, which had occurred at intervals since the receipt of the wound. He was given one grain of morphia, and hot water was placed to his feet, and small quantities of beef essence given at frequent intervals. During the night he reacted a little from shock, but complained greatly of pain in the wound and of weakness. The thigh was supported in a comfortable position by pillows, and wet compresses were kept over the wounds. About one p. m., a brisk hæmorrhage commenced from the posterior wound, which, on examination, was found to be of such a serious nature as to require immediate interference to save the man's life. He was immediately placed under the influence of chloroform, and the posterior wound was freely enlarged, with the idea that the hæmorrhage came from the sciatic artery. This was found not to be the case, however, the blood flowing from the deeper portion of the wound, and probably originating from the branches of the profunda femoris. This opening allowing of a free introduction of the finger, the wound was thoroughly explored, and the femur was found to be hopelessly comminuted. The bleeding still continuing, it was decided to amputate the limb at the hip joint, which was done at once by Assistant Surgeon E. B. Moseley, U. S. A., assisted by Acting Assistant Surgeon C. V. Petteys. The femoral artery was compressed against the brim of the pelvis by Dr. Petteys, and the limb was removed by transfixion from without, joining the incision made previously to explore for the seat of hæmorrhage to that forming the anterior flap, which was rather long, and forming the posterior flap from the muscles on the back of the thigh. About four ounces of blood were lost, as well as could be judged, mostly from a general oozing from the surface of the flaps. The neck of the bone was seized by forceps and the head was removed from the acetabulum with some difficulty, owing to the short leverage obtained. The vessels were tied with silk ligatures and the flaps brought together with silver wire. The patient was then covered with blankets and bottles of warm water placed about him, and, as soon as possible after he reacted from the chloroform, he was given teaspoonful doses of brandy and water. He had taken the anæsthetic well and seemed to come out of it in good condition, recognized those about him, asked if his leg was off, and complained of pain, etc.; his pulse gradually improved in strength and decreased in rapidity. While in this improving condition, and before he could be stopped by the attendants, he suddenly raised his head and shoulders quite high and looked down at where his leg had been, then instantly fell back; the eyes rolled up, respiration became irregular, and he was dead inside of three minutes. Death occurred about two hours after the completion of the operation." The specimen of the fractured femur was forwarded to the Army Medical Museum, with the foregoing report, by the operator, Assistant Surgeon E. B. Moseley, and is numbered 6914 of the Surgical Section. Two views of the specimen are shown in the wood-cuts (FIGS. 124, 125).

FIG. 124.—Shot comminution of upper portion of left femur. *Spec.* 6914.

FIG. 125.—Anterior view of the same specimen.

[2] To the examples of amputations at the hip joint for shot injury cited in Note 1 on page 128, *ante*, should be added the following: 185. A primary operation performed by Assistant Surgeon J. M. STEINER, U. S. A. Private Hall, Co. K, 14th U. S. Infantry, was struck, at the battle of Chapultepec, September 12, 1847, by a round shot, just below the trochanter major of the left thigh. The femur was fractured and the soft parts lacerated for some inches. The patient survived only until evening. The case is reported by the operator, Dr. J. M. STEINER, in the *Medical Examiner and Record of Medical Science*, Philadelphia, 1849, N. S., Vol. V, p. 15.—186. Another primary operation to be added to the examples of exarticulation at the hip, in Note 1, p. 128, *ante*, is cited by M. CHENU from a report of Dr. DE POTOR (*Stat. Méd.-Chir. de la Camp. d'Italie, en* 1859 *et* 1860, Paris, 1869, T. II, p. 693). On June 25th, 1859, an Austrian, wounded at Solferino the night before, was brought to the Cavalry Hospital. The neck of the femur and the cotyloid cavity were comminuted. Coxo-femoral exarticulation was performed by Dr. EHRMANN. The patient survived only two hours.—187. A third primary operation to be added was performed by Dr. W. A. EAST, of San Antonio, Texas. A negro, aged 25, received, in the latter part of 1864, in Lavaca County, Texas, a shot wound at the outer and upper margin of the trochanter major. The head of the femur was comminuted. About ten hours after the injury Dr. EAST exarticulated at the hip by LARREY's method. He recovered, and was last heard from in the winter of 1865–66, through Dr. DOUGLASS (W. A. EAST, *Gunshot Wound—Fracture of the Head of the Os Femoris—Amputation at the Hip Joint—Recovery*, in *Southern Jour. of Medical Science*, 1866, Vol. I, p. 232). It will be noticed that I have omitted from the list of examples of amputations at the hip joint for shot injury in Note 1, p. 128, *ante*, several cases heretofore referred to by writers on this subject as authenticated instances of this exarticulation. I believe, with Dr. A. LÜNING (*Ueber die Blutung bei der Exarticulation des Oberschenkels und deren Vermeidung*, Zürich, 1877, p. 56), that the three cases ascribed to A. BLANDIN, of which two are reported to have been successful, and the successful case of PERRET, are apochryphal. Mr. PH. F. BLANDIN, who cites the successful cases of amputation at the hip in his article *Amputation*, in *Dict. de Méd. et de Chir. Prat.*, Paris, 1829, T. II, p. 280, does not mention these cases, and they are, as far as I have been able to ascertain, first mentioned by VELPEAU (*Nouv. Élém. de Médecine Opératoire*, Paris, 1832, T. I, p. 514); but the latter author, who, in the second edition of his *Nouv. Élém. de Méd. Opérat.*, Paris, 1839, T. II, p. 539, attempts to cite the authorities for his statements, omits to state the sources from which the BLANDIN and PERRET cases are derived. MALGAIGNE, in the discussions of the National Academy of Medicine at Paris, on August 8, 1848 (*Bull. de l'Acad. Nat. de Méd.*, Paris, 1847–48, T. XIII, p. 1278), refers to "a very remarkable thesis" on amputations by "ALEXANDRE BLANDIN, aide-major" to LARREY. In his *Reflexions sur plusieurs points de Chirurgie*, read to the first class of the Imperial Institute on March 6, 1815, and an extract of which is published in *Jour. de Méd. de Chir. et de Phar. Mil.*, Paris, 1815, T. I, p. 132, LARREY states that "Mr. MILLENGEN, Surgeon in Chief of the British Armies in Spain, assured him that he had made, with success, according to his method [of M. LARREY], two amputations" at the hip. I have omitted these cases, as it is probable that Mr. J. G. V. MILLINGEN, who was Chief Surgeon of the British Armies in Spain and Portugal, in 1811 and 1812, had reference to the cases of BROWNRIGG. It would, to say the least, appear strange that British writers on military surgery, who cite BROWNRIGG's and GUTHRIE's cases of amputation at the hip, should have failed to record the cases ascribed to MILLINGEN, who, as late as 1830, was chief surgeon of the British Armies. M. VELPEAU (*Nouv. Élém. de Méd. Opérat.*, Paris, 1839, T. II, p. 540) refers to a successful exarticulation at the hip by WEDEMEYER, and LEGOUEST in his paper *De la désarticulation coxo-fémorale au point de vue de la chir. d'armée*, in *Rec. de Mém. de Méd. de Chir. et de Phar. Mil.*, Paris, 1855, 2me sér., T. XV, p. 224, and *Traité de Chirurgie d'Armée*, Paris, 1863, pp. 669, 670, ascribes two fatal cases of amputation at the hip to the same operator. VELPEAU gives as his authority the *Bulletin de Perussac*, T. II, p. 165; LEGOUEST, the same *Bulletin*, T. III, p. 161. In the second volume of the *Bulletin des Sciences Médicales*, Paris, 1824, "*publié sous la direction de M. le Baron de* PERUSSAC," on p. 161, Obs. III, reference has been made to a case of amputation at the hip cited from an article by Dr. WEDEMEYER. *Amputa-*

with twenty-eight recoveries, two hundred and twenty-five deaths, and one instance in which the result was not ascertained, giving the slightly modified mortality rate of 88.9 per cent., instead of 89.1, as indicated on page 130, *ante*. Of these two hundred and fifty-four cases there were eighty-two primary,[1] with seventy-five deaths, or 91.4 per cent. fatality; fifty-five intermediary, with fifty-two deaths (94.5 per cent.); forty secondary, with thirty-three deaths (82.5 per cent.); eleven reamputations, with four deaths (36.3 per cent.); and sixty-six cases with sixty-one deaths, and one unknown result (93.8 per cent.) in which the time of the operation was not ascertained. According to these statistics it would seem that intermediary operations offer the least chance of recovery, that the results of primary operations are more favorable; that secondary exarticulations give one recovery in twelve cases, and that of the instances of reamputation one in about three proves successful; and I can, therefore, only reiterate what I have already stated on page 78 of *Circular* No. 7, that the statistics "tend to show that unless the nature of the injury is such that the operation can be delayed until the secondary period, it is better that it should be done at once,"[2] although it would appear that the dire results of amputations at the hip,[3] performed for shot injury during the Schleswig-Holstein War of 1864, the Austro-Prussian War of 1866, and the Franco-Prussian War of 1870–71, have had a tendency to raise doubts regarding the expediency of especially the primary exarticulation at the hip.[4]

tion nahe am Hüftgelenke, wegen Osteosteatoma, etc., in *Mag. für die gesammte Heilkunde*, B. XIII, Berlin, 1823. The article will be found at page 45 of the *Magazin*, and it is there stated that the amputation was performed in May, 1821, the width of a hand below the hip joint ("eine Handbreit unter dem Hüftgelenke"). The patient, a soldier named Kloppner, recovered. I have vainly searched Baron FERUSSAC'S *Bulletin* for the fatal cases cited by M. LEGOUEST. The case of fatal secondary exarticulation at the hip by Dr. JOHN WRIGHT, of Illinois, in the case of Private J. W. Spradling, Co. A, 33d Illinois, detailed by the operator in *The Cincinnati Lancet and Observer*, Vol. XI, No. 5, p. 257, May, 1868, and reported also in *Circular* No. 2, War Department, S. G. O., Washington, 1869, p. 109, and mentioned by LÜNING, *loc. cit.*, p. 108, No. 397, I have omitted from the secondary coxo-femoral amputations for shot injury. The records of this Office show that the original shell wound in the *right* side, received at Black River, May 17, 1863, healed, leaving a large cicatrix; that a bedsore formed on the *left* hip, and that the left femur became diseased and was exarticulated on February 20, 1867. It is apparent that the original wound had only a remote connection with the disease for which the operation was performed. Dr. WRIGHT afterwards reported to the Pension Office that "soon after the amputation Spradling was taken with diarrhœa and that dropsy followed, which continued off and on until the date of his death, September 28, 1872."

[1] LARREY'S successful instance of amputation at the hip in the case of the lieutenant of dragoons wounded at Borodino, September 7, 1812, has been cited by M. LEGOUEST (*De la désarticulation coxo-fémorale*, in *Rec. de Mém. de Méd. de Chir. et de Phar. Mil.*, 1855, 2me sér., T. XV, p. 234, and *Traité de Chir. d'Armée*, Paris, 1863, p. 699) as an instance of successful intermediary exarticulation at the hip. This was undoubtedly a primary operation, and I have classed it as such. M. LARREY (*Mém. de Chir. Mil. et Camp.*, Paris, 1817, T. IV, p. 51) details the case and remarks of the operation: "Que j'entrepris, quoique sur le champ de bataille, avec d'autant plus de confiance qu'il la demandait instamment."

[2] Professor B. v. LANGENBECK, in his article: *Ueber die Schussverletzungen des Hüftgelenks*, in *Archiv für Klinische Chirurgie*, Berlin, 1874, B. XVI, p. 299 (republished in his *Chirurgische Beobachtungen aus dem Kriege*, Berlin, 1874), remarks: "As heretofore, I am still quite convinced that disarticulation of the thigh ought not to disappear from military surgery, and that if we do not regard all very severe shot fractures of the hip joint and thigh from the beginning as lost, in all these cases primary exarticulation ought to be performed if possible during the first 12–24 hours. In this connection I can only repeat what I have said in 1868, and what I may again emphasize, that the only two primary exarticulations that I performed in the Schleswig War, 1848, recovered, and that one of the patients operated upon is still alive." I cannot omit here to call attention to the translation of Professor B. v. LANGENBECK'S article by Dr. JAMES F. WEST, F. R. C. S. The translation is published in *The Birmingham Medical Review*, Vol. V, 1876, pp. 29, 88, and 166. At page 100, Professor LANGENBECK is made to say: "The results of the American War, with its great numbers, have been sufficient for settlement of the question of disarticulation of the thigh. We must regard it as an operation which, at the least, ought to be excluded from military practice, and one that ought at the most to be thought of in the light of reamputation." From this Prof. LANGENBECK would appear to be in favor of excluding exarticulation at the hip from the field of military surgery. Nothing could be more erroneous. What Prof. LANGENBECK (*Archiv für Klin. Chir.*, 1874, B. XVI, pp. 298, 299) really says is: "The results of the American War, with its great numbers, have become decisive as regards the value of hip joint exarticulation. It has been designated as an operation which it would be best to exclude from military practice, and which should at the most be thought of in the light of reamputation," and further on he continues with the remark cited in the beginning of this note.

[3] The two exarticulations at the hip for shot injury performed during the Schleswig-Holstein campaign of 1864, and the seven operations performed during the Austro-Prussian War of 1866, proved fatal. Of the forty-four cases of amputation at the hip performed for shot injury received during the Franco-Prussian War, 1870–71, cited in note on page 130, *ante*, the only successful one, as far as I have been able to ascertain, was the case of reamputation at the right hip performed by Professor T. G. MORTON, of Philadelphia, on a soldier named Boasso Dominico (not Dominico Ludovess, as first erroneously communicated in note on page 130, *ante*), whose thigh had been amputated after the battle of Sedan, September 1, 1870.

[4] HOLMES (T.) (*A Treatise on Surgery, its Principles and Practice*, Philadelphia, 1876, p. 344): "The following are, I believe, the main maxims of practice in gunshot injuries of the extremities. . . II (p. 345). In *the lower extremity* gunshot fractures involving the hip joint or the upper third of the femur are usually fatal, however treated. Primary amputation is so fatal in these cases that it is almost abandoned. Several cases have recovered under strictly conservative treatment; a few cases of successful excision are on record; and secondary amputation has been decidedly more successful than primary. The surgeon must use his own discretion in each case, but all surgeons nowadays have a well founded horror of primary amputation at the hip, believing that the operation is almost necessarily fatal, while the injury is not so." BECK (B.) (*Chir. der Schussverletzungen*, Freiburg, 1872, p. 852) remarks: "Exarticulation at the hip . . is only to be performed, as a primary operation, in cases of extensive comminution of the bones with laceration of the soft parts, especially of the large vessels, and where amputation high up is not possible. In injuries which involve the femur in its continuity close to the joint, conservative expectant treatment should be employed, and operative interference should only be had in the further course, as it is known that the secondary operation is more readily tolerated. I have not yet seen in the various campaigns at the places of first dressing a case really adapted to primary exarticulation; either expectation was yet admissible, or resection or high amputation could be performed; or the lesions were of such a nature that there was no prospect of a cure. The wounded of the last category I left to their fate as incurable, ligating only the larger vessels."

Generalarzt B. Beck[1] proposes "to let secondary exarticulation at the hip be preceded by resection," and considers this procedure as not unworthy of the consideration of his colleagues. During the Franco-Prussian War, 1870–71, he had selected a patient[2] for this mode of treatment, and had excised the hip and intended to remove the limb fourteen days later; but he was compelled to leave the patient, who died about a month after the excision. Professor J. Neudörfer,[3] in the case of an Austrian soldier, Johann Schranz, during the Italian War of 1859, resected, on November 27, 1859, the head of the femur for shot injury received at Palestro, May 30, 1859, and, on December 1st, removed the limb at the hip. The patient recovered. This seems to be the only case of this kind on record in military surgery. In civil surgery six instances[4] may be cited in which the exarticulation at the hip had been preceded by excision at the hip joint. Five of the six cases had a successful issue, giving the favorable result of a mortality of 16.66 per cent.

The evidence set forth in the preceding pages in regard to the three plans of treatment of gunshot injuries of the hip joint received during the American civil war shows that of the cases of undoubted intracapsular shot fracture of the hip treated by conservation, 98.8 per cent. had a fatal termination; that in sixty-six cases treated by excision[5]

[1] BECK (B.), *Chirurgie der Schussverletzungen*, Freiburg, 1872, p. 855.

[2] BECK (B.) (*loc. cit.*, p. 854) remarks: "In another case I had performed resection, and intended to disarticulate 14 days later; but I had to leave the patient, who reacted well, and he died of pyæmia afterwards, because my plan was not followed, to wit: to let, at the proper time, when it became evident that recovery could not be achieved in this manner, the resection be followed by exarticulation." The patient he had selected for this manner of operation was Sergeant Major B——, of the 3d French Infantry (see BECK, *loc. cit.*, p. 894, and note on page 91, *ante*, CASE 53), who had survived a shot fracture of the neck and trochanter of the femur at Wörth, August 6, 1870. In the latter part of August the head and neck and more than one-third of the shaft of the femur were excised. But Dr. BECK was sent away before the time for the removal of the limb had arrived. Professor BECK continues: "In another case, which, to my sorrow, I also had to leave before the proper time for the operation, there was an extreme oblique and longitudinal fracture extending into the capsule, with considerable infiltration of the soft parts. When I left Dijon I had ordered that, as soon as the swelling would somewhat go down, the limb should be amputated high up, and that subsequently the remaining bone should be extirpated, provided acute septicæmia should not supervene. Several days after my departure the latter complication appeared; energetic interference was not attempted, and only the projecting end of bone fragment was resected. The patient died shortly afterwards."

[3] NEUDÖRFER (J.), *Handbuch der Kriegschir.*, 1872, B. II. Abth. II, S. 1468, and notes on pp. 90 (CASE 13) and 129 (CASE 120), *ante*.

[4] HEYFELDER (J. F.) (*Ueber Resectionen und Amputationen*, Breslau und Bonn, 1854, p. 155) resected the hip joint on January 11, 1848, in a tailor, Carl Eckstein, aged 20, for caries of the joint, and exarticulated the limb on May 20, 1851. The patient died in two hours.—2. T. CARR JACKSON (*Transactions of the Path. Society of London*, London, 1872, Vol. XXIII, p. 191), for disease of the hip joint, excised, in 1871, the head of the femur in a young man aged 19, and, in 1872, successfully removed the limb.—3. Dr. TEALE (*Medical Times and Gazette*, July 26, 1872, Vol. II, p. 93) excised, on December 28, 1871, the head of the femur for hip disease, in a boy aged 16, and, on July 18, 1872, the limb was successfully removed at the hip.—4. In a girl, aged 7, suffering from hip disease, Mr. HANCOCK performed excision of the head of the femur in the early part of 1871, and, on November 2, 1872, amputation at the hip was performed by Dr. RICHARD BARWELL. The girl recovered (*London Lancet*, April 5, 1873, Vol. I, p. 105).—5. Dr. RUSHTON PARKER (*London Lancet*, 1875, Vol. II, p. 699), on a boy, aged 6, with inflammation of the hip joint, excised the head of the femur on July 31, 1874, and amputated at the hip, November 21, 1874. The boy survived.—6. Professor SPENCE (*London Lancet*, 1875, Vol. II, p. 549), Thomas H——, aged 20; hip disease; excision at the hip October 29, 1864. Amputation April 13, 1875, by Prof. SPENCE; the patient recovered.

the fatality was 90.9 per cent., and that in sixty-six cases treated by exarticulation[1] it was 83.3 per cent.; but from these results it should not be concluded that operative interference was always indicated, and that amputation was preferable to excision. On page 121, of *Circular* No. 2, I have already pointed out that the question as to the most eligible treatment of shot injuries of the hip joint is not susceptible of a purely arithmetical solution, and that the variety of the conditions under which the patients are placed, the diversity in the extent of their injuries, and the inevitable imperfection of all surgical records forbid any such rigorous comparison. Not less than nine[2] of the sixty-six cases of excision at the hip were complicated with such lesions of the pelvic walls and viscera as made any

operative interference useless; among the sixty-six coxo-femoral amputations probably all successful cases have been recorded, while some fatal cases may remain unpublished; and in the three hundred and four cases treated by conservation, the correctness of the diagnosis may be questioned in many instances. The character of the injury must determine the choice of treatment; but the general rules regarding shot wounds of the hip joint[1] laid down in *Circular* 2 are uncontroverted: that "expectant treatment is to be condemned in all cases in which the diagnosis of direct injury to the articulation[2] can be clearly established;" that "primary excisions of the head or upper extremity of the femur should be performed in all uncomplicated cases of shot fracture of the head or neck;" that "intermediary excisions are indicated in similar cases where the diagnosis is not made out till late;" that "secondary excisions are demanded by caries of the head of the femur or secondary involvement of the joint;" that amputation should be performed: "1. When the thigh is torn off, or the upper extremity of the femur comminuted with great laceration of the soft parts, in such proximity to the trunk that amputation in the continuity is impracticable. 2. When a fracture of the head, neck, or trochanters of the femur is complicated with a wound of the femoral vessels. 3. When a gunshot fracture involving the hip joint is complicated by a severe compound fracture of the limb lower down, or by a wound of the knee joint."

---

[2] Professor H. H. SMITH (*Princ. and Pract. of Surgery*, 1863, Vol. I, p. 526) pronounces "compound fractures involving the hip joint are exceedingly dangerous. If left alone death usually results." . . "Some few cases of recovery have resulted after injuries in this locality, but in them the fracture may not have entered the joint, and these few exceptions to the general fatal result certainly offers no encouragement for their repetition. LÖFFLER (F.), *Grundsätze und Regeln für die Behandlung der Schusswunden im Kriege*, Berlin, 1859, Erste Abtheilung, p. 66), speaking of shot injuries of the hip joint, remarks: "The conservative treatment of this injury, according to the experience hitherto acquired, gives no prospect of saving life. Even if pyæmia does not supervene, death ensues sooner or later from exhaustion following endless suppuration."

The preceding portions of this Section were already in print when Professor E. Gurlt's[1] excellent and elaborate work on resections of joints was received. On page 1261 he enumerates one hundred and thirty-seven cases of excision[2] at the hip, of which the results were ascertained in one hundred and thirty-six instances, with sixteen recoveries, a mortality rate of 88.23 per cent.; and on page 1319 he states that, considering the severity of wounds of the hip joint and the great mortality that has hitherto followed them, this result must be regarded as favorable.

[1] GURLT (E.), *Die Gelenk-Resectionen nach Schussverletzungen. Ihre Geschichte, Statistik, End-Resultate*, Berlin, 1879, pp. 1333. Professor GURLT cites the following additional cases of excision at the hip for shot injury not hitherto published: Dr. BRYK (GURLT, *loc. cit.*, p. 63) excised the head of the right femur in the case of Nagy Lajos, age 27, wounded at Buda, May 21, 1849; excision May 24; death June 2, 1849. Dr. ABEL (GURLT, *loc. cit.*, p. 317), Pt. J. Poulsen, 20th Danish Infantry; Düppel, April 18, 1864; neck of right femur; intermediary excision May 4; death May 4, 1864. Dr. HAHN (GURLT, *loc. cit.*, p. 317), P. Rasmussen, 5th Danish Infantry, age 25; Alsen, June 29, 1864, in left trochanters; resection July 4, death July 6, 1864. BURCHARDT (GURLT, *loc. cit.*, p. 483), F. Haberditz, Austrian Infantry, age 42; Koeniggratz, July 3, 1866, through left hip; resection August 6; fatal. BUSCH (GURLT, *loc. cit.*, p. 395), N. Breidt, 6th Rhenish Infantry, Koeniggratz, July 3, 1866, right hip; excision July 20; death July 21, 1866. BUSCH (GURLT, *loc. cit.*, p. 483), F. Harlitschek, Austrian Infantry, age 74; Koeniggratz, July 3, 1866; right trochanter major; excision August 9; death August 13, 1866; pyæmia. KLOPSCH (GURLT, *loc. cit.*, p. 484), N. N. Oest, Austrian Infantry, Koeniggratz, July 3, 1866, left hip; excision July 7; death July 9, 1866. C. REYHER (GURLT, *loc. cit.*, p. 1159), W. Jowanowitsch, age 45; Russo-Turkish War, August 24, 1876; excision Sept. 8; death Sept. 12, 1876. On p. 1154 Dr. GURLT tabulates 2 additional cases of excision at the hip during the Russo-Turkish War, 1876–1878, but gives no details.

[2] The operation of excision at the hip was first proposed in 1769, by CHARLES WHITE, F. R. S., Surgeon to the Manchester Infirmary, at the conclusion of an account of a successful excision of the head of the humerus performed by him April 14, 1768. The paper is recorded in the *Philosophical Transactions* for 1769, Vol. LIX, p. 45, and is republished the following year in CHARLES WHITE'S *Cases in Surgery*, 1770, p. 76. Prior to this a surgeon had, in 1730, according to J. D. SCHLICHTING (*Observationis variæ medico-chirurgicæ*, in *Philosophical Transactions*, London, 1744, Vol. XLII, for the years 1742 and 1743, p. 274), extracted the carious head of the femur in a girl, aged 14, by dilating a fistulous opening over the hip. The girl recovered in six weeks. Similar instances in which the diseased head of the femur was spontaneously eliminated or was extracted were reported by A. F. VOGEL (*Observationes quasdam chirurgicas defendit*, Kiliae, 1771), in 1771; T. KIRKLAND (*Thoughts on Amputations, etc.*, London, 1780), in 1780; HOFMANN (*Vom Schaarbocke*, Munster, 1782), in 1782; OHLE (SCHMIDT'S *Jahrbucher*, 1834, B. II, S. 116), in 1815 or 1816; SCHMALZ (cited by HEDENUS (A. G.), *Commentatio chirurgica de femore in cavitate cotyloidea amputando*, Lipsiæ, 1823, p. 65), in 1817. In the meantime experiments had been made in excising the joints of animals by VERMANDOIS (*Jour. de méd. chir. et phar.*, Janv.-Mar., 1786, T. LXVI, p. 73), in 1785; G. L. KOELER (*Experimenta circa regenerationem ossium*, Gottingen, 1786, experiments 14, 15, 16, pp. 84–98), in 1786; CHAUSSIER (*Magazin Encycloped.*, 5ème annee, T. VI, No. 24), in 1801; F. ROSSI (*Elém. de Méd. Opéral.*, Turin, 1806, T. II, p. 224), in 1806; and G. H. WACHTER (*Dissertatio Chirurgica de Articulis Extirpandis*, Groningen, 1810, pp. 91–94), in 1810; but the first excision of the head of the femur upon the living human subject was performed by Mr. ANTHONY WHITE, of Westminster Hospital, London, in April, 1821. The date of this operation has been variously stated. O. HEYFELDER (*Lehrbuch der Resectionen*, Wien, 1863, p. 78) gives the date as 1815, and, on page 88, as 1818, and refers to an article by LIONEL J. BEALE, in the *London Medical Gazette*, 1832, Vol. IX, p. 853; but Mr. BEALE gives no date for the operation. In COOPER'S *Dictionary of Practical Surgery*, 1872, Vol. II, p. 151, it is also stated that the operation was performed in 1818, and Mr. FERGUSSON speaks of the operation as done in 1818 in his paper in the *Medico-Chirurgical Transactions*, 1845, Vol. X, p. 578, and in his *System of Practical Surgery*, 1870, 5th ed., p. 497. FOCK (C.), (*Bemerkungen und Erfahrungen über die Resection im Hüftgelenk*, in *Archiv für Klinische Chirurgie*, Berlin, 1861, B. I, S. 172) and GOOD (R. R.), (*De la résection de l'articulation coxo-fémorale pour carie*, Paris, 1869) correctly state that the operation was performed in 1821. HODGES (R. M.). (*The Excision of Joints*, Boston, 1861, p. 91) and CULBERTSON (H.), (*Excision of the Larger Joints of the Extremities; Prize Essay*, in *Transactions of the American Medical Association*, 1876, Supplement to Vol. XXVII, p. 40) give 1822, and LEPOLD (F.), (*Ueber die Resection des Hüftgelenkes*, Inaugural Thésis, Würzburg, 1834, p. 15) 1824, as the year of the operation. However, in Mr. FERGUSSON'S *Lecture on Hip Disease*, at King's College Hospital, reported in the *Lancet*, April 7, 1849, at page 361, is quoted Mr. ANTHONY WHITE'S own account of the operation on the boy John West, a twin: "In April, 1821, we met, and the boy being placed on a table, I proceeded," etc., etc., with the operation. This would seem to be conclusive as to the date of the operation. Mr. ANTHONY WHITE'S account states further on in the same page (361) that this boy, five years after the operation, became phthisical, and died of diseased lungs in the Westminster Hospital. The pathological specimen was presented by Mr. A. WHITE to the Museum of the Royal College of Surgeons, and numbered 941, and is described at page 230 of Vol. II, 1847, of the quarto catalogue. The patient was a boy, 14 years old, who had suffered from hip disease following a fall received at the age of nine. The head and neck of the femur were excised. The wound healed quickly and quite a useful joint was obtained. The second excision at the hip was performed in 1828, by Mr. HEWSON, of Dublin. The date of HEWSON'S operation is given as 1823 by BONINO (E.), (*De la résection de la tête du femur*, in *Annales de la Chirurgie Française et Étrangère*, 1844, T. X, p. 391); HODGES (R. M.), (*loc. cit.*, p. 91); SAYRE (L. A.), (*Exsection of the Head of the Femur and Removal of the Upper Rim of the Acetabulum for Morbus Coxarius, with perfect recovery*, in the *New York Journal of Medicine*, 1855, Vol. XIV, p. 81); LE FORT (LEON), (*La resection de la hanche, etc.*, Paris, 1860), and others; but the correct date of the operation seems to be 1828, as given by LEPOLD (F.), (*Ueber die Resection des Hüftgelenkes*, Inaugural thesis, Würzburg, 1834); OPPENHEIM (F. W.), (*Die Extirpation des Schenkelkopfes aus der Gelenkhöhle*, in *Zeitschrift für die gesammte Medicin*, 1836, B. I, S. 137); FOCK (C.), (*Bemerkungen und Erfahrungen über die Resection im Hüftgelenk*, in *Archiv für Klinische Chirurgie*, Berlin, 1861, B. I, S. 172); OTIS (G. A.) (*loc. cit.*, p. 10); GOOD (R. R.), (*De la résection de l'articulation coxo-fémorale pour carie*, Paris, 1869). HARGRAVE (WILLIAM), (*A System of Operative Surgery*, Dublin, 1831, p. 514) states that the operation was performed "a short time since." The third excision of the head of the femur, and the first example of the performance of the operation for shot injury, was done by Dr. OPPENHEIM of Hamburg, in 1829. Professor LONGMORE, in his article on *Gunshot Wounds of the Lower Extremity*, in the second edition of *A System of Surgery*, of Mr. T. HOLMES, New York, 1870, Vol. II, p. 230, remarks: "It is a curious fact, in a historical point of view, that Sir CHARLES BELL proposed excision of the upper fragments in 1818 [1815?] at Brussels, in the case of François de Gay, who had been wounded nineteen days before at Waterloo, and on whom Mr. GUTHRIE successfully practised amputation at the hip joint the next day instead. The reasons for his advice are preserved in some manuscript notes made about the time of the occurrence, in a diary presented to the Army Medical School by Lady Bell, his widow. The chief points are the following: 'My proposal is to extract the head of the bone, and do no more. Mr. GUTHRIE'S proposal is to amputate the thigh at the hip joint. If the bone be taken out, there is a great cavity and suppuration certainly; but by this means the shock and violence will be saved. I fear the shock of so great an injury, especially as now the wound cannot be cut off (alluding to its extent and sloughing condition), and its injury must be superadded to that of the incisions. The man will readily allow of my proposal, but not of G.'s. However, next day he said he would consent. In the meantime I was forced home by business,' etc. The separated head and neck of the femur in GUTHRIE'S case is preserved in the Museum of the Army Medical Department at Netley, and, both from its intrinsic interest and because it almost exactly corresponds with the fragment in the Crimean case in which resection was successfully performed, a drawing of it is appended." A reduced copy of this drawing is reproduced in the wood-cut (FIG. 126).

FIG. 126.—Head, neck, and part of shaft of femur, from GUTHRIE'S successful intermediary amputation at the hip, in the case of François Duguet. *Spec.* 2929, in Army Med. Museum at Netley. [After Prof. LONGMORE.]

SECTION III.

INJURIES OF THE SHAFT OF THE FEMUR.

In this Section will be considered only injuries of the shaft of the femur unattended by primary injury of the hip or knee joints, and inflicted by weapons of war. Simple and compound fractures produced by other causes are reserved for consideration in Chapter XII of this volume. No sword or bayonet injuries of the femur are recorded on the registers of this Office, and it is, therefore, only necessary to consider the shot injuries of and the operations performed in the continuity of the femur. There are recorded 6,738 shot injuries of the femur. Of these, 3,620 were treated by the expectant conservative mode; 11 were followed by excision at the hip; 29 by exarticulation of the hip joint; 1 by excision in the shaft and subsequent disarticulation at the hip; 6 by excision in the shaft and subsequent amputation of the thigh; 168 by excision in the shaft; 2 by amputation of the thigh and subsequent exarticulation at the hip,[1] and 2,901 by amputation of the thigh. The total number of amputations of the thigh to be recorded in this Section will be 6,238, the discrepancies in numbers being due to the many examples of amputation through the thigh in which the operation was performed for shot lesions of the knee joint or leg. The shot injuries of the femur were accompanied by flesh wounds of the upper or lower extremities, of the back, and of the chest. Some were attended by fracture of the pelvic bones, of the bones of the leg, and of the upper extremities; and, in a few instances, by penetrating wounds of the chest or abdomen. These instances will be alluded to in the various subdivisions of this Section.

At page 666 of the *Second Surgical Volume* the number of shot injuries of the shaft of the humerus is stated as 8,245, and, on page 697 of the same volume, the number of amputations in the arm recorded is 5,456. Comparing these figures with the injuries and amputations of the thigh, it will be seen that while the shot fractures of the humerus exceed the shot injuries of the shaft of the femur by 1,407, the amputations in the thigh are in excess of the amputations in the humerus by 782. The latter fact is, perhaps, to be attributed to the perilous nature of shot injuries of the knee joint. Of the 6,738 cases of shot injuries of the femur, 162 were shot contusions and 6,576 were shot fractures.

SHOT CONTUSIONS OF THE SHAFT OF THE FEMUR.—In treating of shot injuries of the shaft of the humerus in the *Second Surgical Volume*, at pages 667 and 817, only twenty-two instances of contusion of the humerus could be cited. The examples of shot contusion of the femur are not rare, one hundred and sixty-two instances of this class being found on the registers of this Office: fifty in the upper, thirty in the middle, and forty-two in the lower third; while in forty instances the precise seat of the injury was not stated. Amputation in the thigh became necessary in nine instances, with seven

[1] The cases of excisions and exarticulations at the hip for shot injuries of the shaft of the femur have already been considered in the preceding section of this Chapter. For the 11 instances followed by excision at the hip see CASES 206, 208, 216, 220, 229, 233, 239, 243, 261, 263, 266, *ante*. The 29 cases followed by exarticulation at the hip are: CASES 272, 275, 277, 278, 280, 284, 285, 286, 289, 290, 291, 293, 294, 295, 297, 299, 303, 305, 308, 309, 311, 314, 319, 320, 321, 323, 324, 325, 328, *ante*. In CASE 298 excision in the shaft was followed by amputation at the hip, and in CASES 329 and 337 exarticulation at the hip joint had been preceded by amputation of the thigh.

fatal results, a mortality of 77.7 per cent., while of the remaining one hundred and fifty-three cases treated without operative interference, thirty-five, or 22.8 per cent., proved fatal:

TABLE XIX.

Numerical Statement of One Hundred and Sixty-two Cases of Shot Contusion of the Shaft of the Femur.

POINT OF CONTUSION.	AGGREGATE.	TREATED BY CONSERVATION.				TREATED BY AMPUTATION OF THE THIGH.			
		Cases.	Recovered.	Died.	Ratio of Mortality.	Cases.	Recovered.	Died.	Ratio of Mortality.
Upper Third of Femur	50	49	33	16	32.6	1	.....	1	100.
Middle Third of Femur	30	28	23	5	17.8	2	1	1	50.
Lower Third of Femur	42	36	32	4	11.1	6	1	5	83.3
Part of Femur not specified	40	40	30	10	25.0	.....	.....	.....	.....
Total	162	153	118	35	22.8	9	2	7	77.7

It is probable that in many cases in which the periosteum or the external layer of the femur was only slightly bruised the injury to the bone remained unnoticed, and that the wound, treated as a simple flesh wound, healed without complication; but generally, after a few weeks' suppuration, the surface of the bone became roughened and sometimes slight exfoliation followed:

CASE 338.—Private H. H. Coombs, Co. D, 6th Maine, aged 22 years, was wounded at Fredericksburg, May 3, 1863, and entered Douglas Hospital, Washington, five days afterwards. Assistant Surgeon W. Thomson, U. S. A., reported: "He was struck by a bullet on the outer side of the right thigh. The missile was extracted from below the crest of the ilium on May 14th, the operation demanding a very extensive incision, which was kept freely open to permit the discharge to escape. The femur had been denuded of its periosteum for several inches, the ball evidently having been deflected upward after impinging upon that bone. This man recovered, and was transferred to Lovell Hospital, Portsmouth Grove, July 3d." The patient subsequently entered Cony Hospital, Augusta, Maine, whence he was returned to duty October 24, 1864. On June 28, 1865, he was mustered out of service, and subsequently he was admitted on the Pension Roll. The Bangor Examining Board, October 4, 1873, certified to the injury, and adds: "The scar is three inches long, and deep, permitting the finger to pass through the fascia and feel roughened bone. Slight lameness results." Examiner C. Fuller, of Lincoln, Maine, reported, October 20, 1877: "The cicatrix is now so depressed that the little finger can be laid in it, and the bone below is a little hollowed, the parts around being very tender on pressure. A disagreeable pricking sensation is also produced there on percussion at the bottom of the heel." The pensioner was paid December 4, 1878. The extracted missile, a conical ball, was contributed to the Museum by Assistant Surgeon W. Thomson, and constitutes Specimen 4277 of the Surgical Section.

In two cases of shot contusions of the middle third, and in ten of the lower third of the femur, anchylosis or stiffening of the knee joint resulted. One example[1] will be cited:

CASE 339.—Private W. A. Currier, Co. B, 22d Massachusetts, aged 33 years, was wounded at Fredericksburg, December 13, 1862, and admitted into Harewood Hospital, Washington, four days afterwards. Surgeon T. Antisell, U. S. V., recorded the following history: "A minié ball entered the outer side of the right thigh at the middle third, striking against the femur. The missile was extracted on December 18th, being found to have moulded itself to the cylindrical form of the shaft of the bone. The patient's general health was good. Simple dressings were applied to the wound. On February 11, 1863, the bone was found to be re-covered with periosteum excepting a very small portion, and the wound was allowed to close. On February 20th it had healed; but, on this day, erysipelas set in, spreading rapidly, and invading the whole leg and the body to the umbilicus. The leg swelled enormously and vesicated over a large portion of its surface, the cellular tissues being distended with serum. Punctures being made, several quarts of serum were discharged. By April 22d the patient had recovered, though he was still debilitated, and there was yet some enlargement. He was discharged from service May 9, 1863, by reason of an œdematous and stiffened condition of the wounded leg." Examiner A. L. Monroe, of Medway, Massachusetts, certified, January 12, 1864: "The knee cannot be flexed perfectly; the leg is swollen, and the fascia of the thigh seems to have been destroyed by the erysipelatous inflammation. The limb will improve, but it will never be perfectly restored." The Boston Examining Board, in 1873, certified to "varicose condition of the veins of the thigh and leg, phlebitis, etc." Pensioner was paid March 4, 1879.

[1] Partial or complete anchylosis of the knee joint following shot contusion of the femur were noted also in the cases of: Pt. D. Brown, E, 8th Maryland. Pt. S. Clark, B, 14th Infantry, anchylosis of knee, necrosis, exfoliation. Pt. H. B. Baker, A, 16th Maine; in this instance there was almost complete anchylosis at the hip and knee. Corporal J. C. Noteman, D, 8th Wisconsin, partial anchylosis and paralysis. Pt. R. B. Pierce, F, 7th Wisconsin. Pt. H. Schocker, B, 12th Ohio Cavalry. Lieutenant A. D. Detweiler, C, 116th Pennsylvania. Pt. J. D. Page, K, 57th Illinois. Pt. E. J. Russell, G, 10th Regiment Veteran Reserves, partial anchylosis of knee joint, and false anchylosis of ankle joint. Pt. F. De Brayman, E, 53d Pennsylvania. Pt. J. W. Bowlinger, M, 4th Cavalry.

Of the grave complications after shot contusions of the shaft of the femur, pyæmia was the most frequent; it supervened in eighteen instances, of which sixteen proved fatal. There were thirteen cases in which serious secondary hæmorrhage followed. Two of the patients recovered, eleven died. Three cases of recovery from gangrene, and three fatal cases were reported:

FIG. 127.—Shot contusion of left femur. *Spec.* 4341.

CASE 340.—Private J. White, Co. A, 4th New Jersey, aged 19 years, was wounded before Petersburg, April 2, 1865, and admitted to the field hospital of the 1st division, Sixth Corps, where Surgeon R. Sharpe, 15th New Jersey, recorded: "Shot wound of left thigh." On the following day he was conveyed to the Depot Hospital at City Point, and one week afterwards he was transferred to Washington. Surgeon R. B. Bontecou, U. S. V., who removed the missile from the patient's limb, made the following report: "He was admitted to Harewood Hospital April 12th with a wound of the upper third of the thigh, the ball entering posteriorly, passing upward and inward, impinging against the femur and denuding it of a small portion of its periosteum, and lodging beneath the vastus externus muscle. On April 17th, the ball was extracted by incision, the patient being under the influence of chloroform. The condition of the injured parts and the constitutional state of the patient at the time of the operation were poor. He was suffering from diarrhœa and his progress was unfavorable. On April 19th, pyæmic symptoms were developed. The treatment consisted of alteratives, and was supporting throughout. The patient gradually sank, and died April 27, 1865." The upper third of the injured femur was contributed to the Museum by Surgeon Bontecou, and is represented in the adjacent wood-cut (FIG. 127).

In the following fatal instance of shot contusion of the shaft of the femur, gangrenous osteomyelitis[1] was found at the autopsy:

FIG. 128.—Shot contusion of left femur. *Spec.* 4201.

CASE 341.—Private J. Kagrice, Co. F, 198th Pennsylvania, aged 30 years, was wounded during the engagement at White Oak Road, March 31, 1865. Surgeon W. R. DeWitt, U. S. V., recorded his admission to the field hospital of the 1st division, Fifth Corps, with "shot wound of left thigh," and his transfer to City Point on the following day. Several days afterwards the wounded man was transferred to Douglas Hospital, Washington, whence Assistant Surgeon W. F. Norris, U. S. A., contributed the specimen (*Cat. Surg. Sect.*, 1866, p. 258, *Spec.* 4201), with the following history: "The injury was a severe gunshot contusion of the left femur at its middle third. The patient was in good health and spirits at the time of his admission and doing well. The wound was carefully examined, but the ball could not be traced. On April 23d, a large abscess was opened on the anterior aspect of the thigh near the trochanter. On the 29th, another similar incision was required in order to give free exit to pus. The patient, however, continued pretty well until May 5th, when he had a chill. This recurred on May 7th and 8th, and on the 9th, 12th, 13th, and 14th, he had two chills a day. The thigh became painful, the discharge thin and fetid. On May 16th, the patient became delirious, had another chill, and his tongue became swollen and inflamed. He died on the following day. At the *autopsy* no pleurisy or effusion was found in either thoracic cavity. The lungs, liver, spleen, kidneys, and brain were carefully examined for pyæmic abscesses, but appeared healthy. On examining the femur it was found that the ball had struck it at its middle third, contused the bone without fracturing, and, being deflected from its course, had lodged in the hollow above the acetabulum. The hip joint was healthy and uninjured. A longitudinal section was made of the femur, which exhibited well marked gangrenous osteomyelitis, the medulla being of a dirty greenish color, dry, pulverulent, and excessively fetid. The interspaces between the cancelli contained a dark greenish liquid, a quantity of which escaped in sawing the bone, and was also extremely offensive. The bone where the missile had struck had become necrosed and nearly separated, and around this partial exfoliation a ring of new bone had formed. A portion of the injured femur is illustrated in the adjacent wood-cut (FIG. 128).

Besides the specimens referred to in the preceding two cases the Army Medical Museum possesses nine representations of shot contusions of the shaft of the femur,[2] and several missiles flattened by impact with the bone.[3]

---

[1] Dr. J. A. LIDELL in his excellent paper on *Contusion and Contused Wounds of Bone, with an Account of Thirteen Cases*, in *Am. Jour. Med. Sci.*, 1865, Vol. L, p. 17, gives the following as the principal pathological effects of contusions of bone: 1. Ecchymosis of the osseous tissue; 2. Ecchymosis of the medullary tissue; 3. Osteomyelitis of a simple character; 4. Necrotic osteitis; 5. Suppurative osteomyelitis; and 6. Gangrenous osteomyelitis.

[2] *Specimen* 291 (*Cat. Surg. Sect.* A. M. M., 1866, p. 259): The upper third of the right femur, necrosed one inch below the trochanter minor; the adjacent bone is honeycombed by suppuration. *Spec.* 759 (*Cat.*, p. 334), showing exfoliation and some periosteal thickening in the lowest third of the right femur. *Spec.* 1671 (*Cat.*, p. 259): Section of right femur, showing an exfoliation about to separate, and some necrosed action. *Spec.* 2075 (*Cat.*, p. 259): Contusion at the inner surface of the middle third of the right femur; the bone is necrosed and greatly roughened by suppuration. *Spec.* 3106 (*Cat.*, p. 258): Portion of shaft of middle third of left femur contused by a ball, which split and escaped in two pieces; the bone is necrosed where struck by the ball; an abscess was found in the medullary canal corresponding with this spot. *Spec.* 3873 (*Cat.*, p. 258): A section of the upper third of the left femur contused by shot; there is a slight degree of caries with widespread periosteal disturbance. *Spec.* 6716: Part of the left femur slightly contused. The specimen is sawn longitudinally, exhibiting diseased action of the bone. *Spec.* 2437 (*Cat.*, p. 283): The lowest third of the left femur amputated for contusion above the inner condyle, where it is locally carious. *Spec.* 1985 (*Cat.*, p. 258), see CASE 34, p. 21, *ante*.

[3] *Specimen* 4277 (*Cat. Surg. Sect.* A. M. M., 1866, p. 609) has been alluded to in CASE 340. *Spec.* 2726 (*Cat.*, p. 598): A spherical ball, with a small concave impression caused by contact with the shaft of the femur, in the case of J. C——, Co. I, 1st Ohio Artillery. *Spec.* 3009 (*Cat.*, p. 604): A conoidal rifle ball from which a smooth slice has been removed on one side; case of T. McG——, 1st Vermont Cavalry.

Ligations after Shot Contusions of the Femur.—At page 47 were tabulated, it will be remembered, one hundred and twenty-seven cases of ligation of the femoral artery for shot flesh wounds of the thigh, with ninety-one deaths, a mortality rate of 71.7 per cent. To this series of operations must be added seven instances of ligations of the femoral following shot contusions of the femur, the patients perishing in every instance:

CASES 342–348.—Private G. Coleman, Co. F, 94th New York, aged 19 years; wounded August 29, 1862; slight injury of upper third of femur. December, 1862, ligation of femoral artery on account of secondary hæmorrhage; pyæmia. Died December 3, 1862.—Sergeant G——, 16th Illinois; minié ball passed through left thigh about three and a half inches above the knee joint, grazing the femur; admitted into the hospital of the 2d division, Fourteenth Corps. Surgeon E. Batwell,[1] 14th Michigan, reported that on the eleventh day considerable hæmorrhage occurred, eight or ten ounces of blood being lost. The tourniquet was loosely applied. The bleeding recurred on the twelfth and thirteenth days, when Dr. Batwell cut down and tied the main vessel in the middle stage of its course. He seemed comfortable for about thirty-six hours; but notwithstanding all the efforts used to keep up the temperature of the leg and to nourish and support his system, he gradually sank into a comatose condition, and died on the eighteenth day after the reception of the injury.—Private A. Kitzing, Co. H, 57th New York, aged 40 years; wounded at Fredericksburg, December 13, 1862, a musket ball passing through the left popliteal space. December 20th, violent hæmorrhage from inner orifice of wound. Surgeon J. P. Prince,[2] 36th Massachusetts, immediately placed a ligature on the femoral at the angle formed by the sartorius and adductor magnus muscles, which entirely controlled the hæmorrhage. The bleeding recurred and continued to increase, notwithstanding the use of styptics and pressure, and, on December 23d, the left thigh was amputated at the upper part of the lower third. Pyæmia developed, and the patient died January 12, 1863. The specimen of the injured knee was forwarded to the Army Medical Museum by the operator, Dr. Prince, and is numbered 535 of the Surgical Section. The femur has been grazed above the condyle and the popliteal artery cut across by a bullet (*Cat. Surg. Sect.*, A. M. M., 1866, p. 457).—Private J. Roberts, Co. A, 9th West Virginia, aged 31 years; wounded at Winchester, July 20, 1864; shot wound of left thigh, denuding upper third of femur of its periosteum; missile lodged, and was extracted July 27th; hæmorrhage set in on July 29th, and Surgeon J. B. Lewis, U. S. V., ligated the femoral artery. Typhoid symptoms supervened, and the patient died August 24, 1864.—Private J. Scott, Co. D, 69th New York, aged 30 years; wounded at Petersburg, July 24, 1864; ball entered upper part of left thigh, striking the femur and denuding it of its periosteum for two inches. August 4th, hæmorrhage to the extent of one pint; limb bandaged from distal extremity and wound plugged with lint saturated with persulphate of iron. Bleeding recurred on the next day, and Acting Assistant Surgeon H. M. Dean ligated the femoral artery in Scarpa's space, about three inches below Poupart's ligament. The case progressed favorably until August 20th, when he had a slight chill followed by profuse perspiration. He died August 21, 1864, of pyæmia. The pathological specimens in the case, consisting of the femoral artery, the contused portion of the shaft of the femur, and the femoral vein, were forwarded to the Army Medical Museum, and are numbered 3105, 3106, and 3118, respectively, of the Surgical Section. They were contributed by the operator, Dr. Dean.—Sergeant S. Van Wie, Co. B, 62d Ohio, aged 25 years, was admitted into the hospital at Beverly, New Jersey, August 21, 1864, with a shot wound of the left thigh, injuring the bone, received at Deep Bottom, August 16, 1864. Parts in sloughing condition. September 28th, secondary hæmorrhage to extent of eight ounces. Acting Assistant Surgeon J. C. Morton ligated the femoral artery. Patient died September 29, 1864, from exhaustion.—Private *A. Young*, Co. F, 1st Missouri Cavalry, was wounded at Cape Girardeau, April 26, 1863. He was admitted into the post hospital at Cape Girardeau, and Surgeon H. A. Martin, U. S. V., reported that a minié ball entered the lower third of left thigh, struck the femur without fracturing it, and lodged in the perineum. The ball was removed, in a flattened state, May 8th. Profuse hæmorrhage occurred on May 11th. The femoral artery was ligated above and below the seat of injury on May 17th. The hæmorrhage did not recur, but the patient sank, and died May 20, 1863.

One fatal instance of ligation of the profunda for secondary hæmorrhage following shot contusion of the shaft of the femur is found recorded on the registers of the Office:

CASE 349.—Corporal James Sturgis, Co. G, 85th Pennsylvania, received at Deep Bottom, Virginia, August 16, 1864, a shot wound of the left thigh, the missile injuring the femur. He was admitted into the hospital at Beverly, New Jersey, August 21st. The parts began to slough; hæmorrhage to the amount of sixteen ounces occurred, and, on November 1st, the profunda was ligated in the continuity by Acting Assistant Surgeon J. C. Morton. Hæmorrhage recurred from the point of ligation, and death ensued November 6, 1864.

Adding to this the six cases of ligation of the profunda for hæmorrhage following shot flesh wounds of the thigh, recorded on page 49, *ante*, we have seven instances of this operation with five deaths, in shot injuries of the thigh without fracture of the femur.

Amputations consequent on Shot Contusions of the Shaft of the Femur.—In nine instances of shot contusions of the shaft of the femur amputation of the thigh was performed. Four were intermediary, five secondary operations; the former proved fatal; of

[1] BATWELL (E.), *Notes of Army Practice—Ligation of the Femoral Artery for Secondary Hæmorrhage*, in *Med. and Surg. Rep.*, 1865, Vol. XII, p. 254, and LIDELL (J. A.), *United States Sanitary Commission Memoirs*, New York, 1870, *Surgical Volume* I, p. 186.

[2] PRINCE (J. P.) (*Surgical Cases—Wound in the Popliteal Space—Secondary Hæmorrhage—Amputation*, in *Boston Med. and Surg. Jour.*, 1863, Vol. LXVIII, p. 70) gives a detailed account of the case.

the latter, two recovered. The seat of contusion was in the upper third in one instance, in the middle in two, and in the lower in six instances; while four amputations, with one recovery, were practised in the upper third; one, fatal in the middle third; and four, with one successful issue, in the lower third. The cases will be briefly detailed:

CASES 350–358.—Private H. F. Rugg, Co. H, 2d New York Heavy Artillery; wounded at Cold Harbor, June 3, 1864; a minié ball passed through the middle third of the right thigh, injuring the bone and causing necrosis. Circular amputation of the thigh at the upper third was successfully performed at Blairsville, Pennsylvania, on January 24, 1866, by Drs. St. Clair and T. M. Laney. The pensioner was paid in 1878.—Lieutenant W. D. Templin, Co. D, 32d Iowa, aged 26 years; wounded at Bayou de Glaze, Louisiana, May 18, 1864; missile entered two inches above knee internally and posteriorly and passed downward and outward, slightly grazing the femur. On July 22d, Surgeon E. Powell, 72d Illinois, amputated the left thigh at the lower third. The patient recovered and was discharged March 30, 1865, with a sound stump.—Private *R. L. Donald*, Co. B, 27th North Carolina, wounded at Antietam, September 17, 1862, through the middle of the left thigh, and admitted to the hospital at Chester, Pennsylvania, October 2d. Necrosis and hectic supervening, and death being imminent, amputation at the junction of the middle and upper thirds of the thigh was performed by Dr. J. Ashhurst, jr.,[1] by circular incision, November 6, 1862. The patient, with great difficulty, rallied from the shock of the operation; but subsequently sank suddenly, and died seven hours afterwards. Dr. Ashhurst contributed the specimen of the injured femur to the Army Medical Museum. It is numbered 863 of the Surgical Section, and consists of "five inches of the shaft of the left femur, showing local necrosis after contusion by a conoidal ball in the upper third. A moderate deposit of callus has occurred adjacent to the seat of injury. The specimen is an interesting illustration of serious injury without complete fracture." (FIG. 129.) (*Cat. Surg. Sect.*, A. M. M., 1866, p. 288.)—Private B. A. Elmore, Co. B, 6th Michigan Cavalry, aged 18 years, received, near Old Church, Virginia, May 28, 1864, a shot wound of the left knee joint. "A conical ball entered the joint from the front, and passing backward and upward, impinged against the inferior epiphysis of the femur, glanced, and passing upward, lodged high among the muscles of the thigh, deep. Knee and thigh considerably swelled. Track of bullet emphysematous, filled with thin, dirty looking, offensive pus. The emphysema and suppuration extended as high up as the junction of the middle and superior thirds of the thigh. June 5th, thigh amputated high up in the upper third by the double flap method. The bullet dropped out while cutting the posterior flap. There was but trifling loss of blood during the operation, and the patient reacted promptly. June 6th, feverish and restless, pulse rapid. June 10th, pyæmia developed. Died June 17, 1864." The operator, Surgeon John A. Lidell, U. S. V., contributed the portion of the femur removed, together with the history of the case, to the Army Medical Museum. The specimen is numbered 2437 of the Surgical Section, and consists of the "lowest third of the left femur. It is contused above the inner condyle, where it is locally carious. The specimen is sawn open longitudinally, exhibiting diseased action to the center of the bone." (*Cat. Surg. Sect.*, A. M. M., 1866, p. 283.)—Captain G. Grecheneck, Co. A, 72d New York, received, at Williamsburg, Virginia, May 4, 1862, a gunshot wound of the right popliteal space. Surgeon R. B. Bontecou reported that a minié ball transfixed the thigh between the hamstrings and condyles of the femur, grooving that bone slightly at the attachments of the gastrocnemius muscles and injuring the artery and nerve. The foot became gangrenous, and amputation in the lower third of the thigh, by circular operation, was done. Gangrene attacked the stump on the 15th, and he died May 16, 1862.—Private *Lafayette Hogan*, Co. G, 14th Tennessee, was admitted into Lincoln Hospital, Washington, December 23, 1862, with a gunshot wound of the right knee. Amputation at the lower third of the thigh was performed on the day of admission. The patient died January 1, 1863, from hæmorrhage. Assistant Surgeon G. M. McGill, U. S. A., forwarded the pathological preparation (*Specimen* 1891, Section I) to the Army Medical Museum. It consists of "a ligamentous preparation of the bones of the right knee, except the patella, amputated in the lowest fourth, apparently for a contusion just above and behind the outer condyle." (*Cat. Surg Sect.*, A. M. M., 1866, p. 338.)—Private J. L. Hudson, Co. I, 59th Illinois, aged 18 years, received, at Nashville, December 15, 1864, a shot wound of the right thigh just above the knee joint, the ball grazing the femur and denuding it of its periosteum. The wound progressed favorably until December 30th, when the structures of the joint became implicated. An abscess made its appearance just below the patella. The patient became much debilitated. On January 25, 1865, Acting Assistant Surgeon F. B. Nossinger amputated the right thigh at the middle third by the circular method. Great prostration followed. Irritative fever ensued, and the patient died February 1, 1865.—The case of Private A. Kitzing, Co. H, 57th New York; wounded at Fredericksburg, December 13, 1862, whose thigh was amputated on account of recurrent bleeding after ligation of the femoral artery, has been alluded to on page 172, *ante*, CASE 344.—Private M. Shay, Co. B, 61st New York, aged 20 years, received, at Antietam, September 17, 1862, a shot wound of the anterior aspect of the right thigh; the femur was bruised; ball lodged. October 20th, ball found lying against the femur, at upper third, and removed. The discharge became profuse and offensive and the patient failed daily. November 15th, flap amputation of right thigh at the upper third by Surgeon H. S. Hewit, U. S. V. The patient died November 24, 1862. Dr. Hewit contributed the specimen shown in the wood-cut (FIG. 130). There is "a large portion of necrosed bone nearly detached, with very little callus." He also forwarded the preparation of the right femoral artery to the Museum. It is numbered 853 of the Surgical Section.

FIG. 129.—Shot contusion of shaft of left femur. *Spec.* 863.

FIG. 130.—Necrosis of the right femur. *Spec.* 1096.

[1] Dr. ASHHURST, in a published account of this case (*Surgical Cases, Illustrating some Practical Points*, in *Am. Jour. Med. Sci.*, 1863, Vol. XLV, p. 345), states that: "The wound, which appeared to be simply a flesh wound, did well, and was nearly healed, when, from some then unknown cause the track reopened, and by the probe and little finger dead bone was detected about the middle of the left femur."

The left thigh was amputated in three, the right in six instances; of the latter, two recovered. The modes of operation selected were: The circular amputation five times, the flap operation twice; in two instances the manner of operation was not indicated. Seven amputations were practised on Union, two on Confederate soldiers.

Comparing the results of cases of shot contusion in the shaft of the femur with the results of analogous cases in the shaft of the humerus, we find that of one hundred and sixty-two contusions in the femur forty-two, or 25.9 per cent., proved fatal, while of twenty-two patients with contusion of the humerus only four, or 18.1 per cent., succumbed, and that while in not a single instance of contusion of the humerus operative interference was deemed necessary, nine amputations of the thigh were practised for complications following shot contusions of the femur.[1] The serious consequences ascribed to injuries of this nature by Dr. Lidell have been alluded to on page 171, *ante*. Professor L. Stromeyer, Dr. H. Gibbons, Professor A. Lücke, M. Jobert (de Lamballe), Dr. C. Heine, and Dr. J. Arnold[2] have noted the complications accompanying shot contusions of the femur; but only a few writers on military surgery have cited instances of such injuries.[3]

SHOT FRACTURES OF THE SHAFT OF THE FEMUR.—Shot fractures of the shaft of the femur were considered as almost universally fatal by the older writers on military surgery, and amputation of the thigh was regarded by many as the only means of saving the patient's life.[4] But the many successful attempts at preservation of the limb in cases of shot fracture of the femur within the last twenty years leave no doubt as to the value of the conservative treatment of such fractures.[5] Six thousand five hundred and

[1] SCHWARTZ (H.) (*Beiträge zur Lehre von den Schusswunden*, Schlesswig, 1854, p. 147), in a very interesting chapter, carefully notes the frequently serious consequences following shot contusions of the femur, and remarks that: "Notwithstanding the most careful treatment, the attempts at conservation not rarely necessitate consecutive amputation as a last means of saving the life of the patient." A. J. JOBERT (de LAMBALLE) (*Plaies d'armes à feu*, Paris, 1833, p. 255) refers to contusions with denudation of the femur, and cites a case in which he amputated the thigh unsuccessfully.

[2] STROMEYER (L.), *Ueber die bei Schusswunden vorkommenden Knochen verletzungen*, Freiburg, 1870, p. 3. GIBBONS (H.), *Contused Wounds of Bone*, in the *Pacific Med. and Surg. Jour. and Press*, San Francisco, 1866, Vol. VIII, p. 284. LÜCKE (A.) (*Kriegschirurgische Aphorismen aus dem Zweiten Schleswig Holsteinschen Kriege im Jahre* 1864, Berlin, 1865, p. 67) remarks that contusions of the femur by musket balls are very severe injuries, frequently misapprehended, and followed by ostitis, osteomyelitis, and even osteophlebitis, and cites three cases of which one proved fatal. JOBERT (A. J. de LAMBALLE), *Contusion des os*, in *L'Union Medicale*, Paris, 1865, T. XXV, pp. 263, 337. HEINE (C.), *Die Schussverletzungen der unteren Extremitäten*, Berlin, 1866, p. 164, etc. ARNOLD (J.) (*Anatomische Beiträge zu der Lehre von den Schusswunden*, Heidelberg, 1873) describes the pathological changes following contusions of the femur as observed in his autopsies of six cases of this injury.

[3] LARREY (H.) (*Hist. Chir. du siege de la Citadelle d'Anvers*, Paris, 1833, p. 202, etc.) cites three successful instances of shot contusion of the femur, and adds: "Les resultats consécutifs de cette blessure, constatés à l'hôpital, ont été l'adhérence de la principale cicatrice, l'atrophie et l'ankylose du genou." CHENU (J. C.) (*Rapport, etc., pendant la Campagne d'Orient en* 1854, 1855, 1856, Paris, 1865, p. 374) tabulates 146 cases of shot contusion of the femur with 22 deaths, a mortality of 15.0 per cent. MATTHEW (T. P.) (*Med. and Surg. Hist. of the British Army*, etc., London, 1858, p. 355) tabulates 43 cases of shot contusions and partial fractures of the lower extremities, but it is impossible to eliminate from his tabulations the number of shot contusions of the femur. CHENU (J. C.) (*Stat. Med. Chir. de la Camp. d'Italie en* 1859 *et* 1860, Paris, 1869, p. 715) groups 103 shot contusions of the femur with 13 deaths. SCHINZINGER (A.) (*Das Reserve-Lazareth Schwetzingen im Kriege* 1870 *und* 1871, Freiburg, 1873, p. 69) observed 10 cases of shot contusion of the femur. One of the cases proved fatal from pyæmia, another succumbed to anæmia following arterial bleeding. SCHÜLLER (MAX.) (*Kriegschirurgische Skizzen aus dem Deutsch-Französischen Kriege*, 1870–71, Hannover, 1871, p. 66) cites 2 cases of shot contusion of the femur, one in the middle, the other in the lower third; both recovered. BECK (B.) (*Chir. der Schussverletzungen*, Freiburg, 1872, p. 677) reports 15 cases of shot contusions of the femur in the Bavarian (XII) Corps during the Franco-Prussian War, 1870–71, of which 3, or 20 per cent., proved fatal, and remarks: "That the shot contusions, although entirely innocuous looking in the beginning, are apt, in the progress of the case, to prove dangerous, and to convince the surgeon how careful he must be not to overlook the sneaking initiatory processes of inflammation of the periosteum and the interior of the bone."

[4] RAVATON (*Chirurgie d'Armée ou Traité des Plaies d'armes à feu*, etc., Paris, 1768, p. 323): Les coups de feu qui fracassent l'os de la cuisse dans son entier, sont si fâcheux que j'ai vu périr tous ceux qui l'ont eu fracture." SCHMUCKER (J. L.) (*Vermischte Chir. Schriften*, Berlin und Stettin, 1785, p. 42): "If the fracture is in the lower part of the bone, the danger is relatively a great deal less, as the muscles are not very powerful here, and, in such a fracture, amputation should not be at once performed, but all other means should first be tried; and very frequently I have happily cured fractures of this kind; but if the femur is fractured and splintered in the middle or above the middle, I never wait for complications, but perform the operation before they occur, and several times I have cured patients where the operation has been done soon." BAUDENS (L.) (*Clinique des plaies d'armes à feu*, Paris, 1836, p. 460) remarks: "Toute fracture de cet os [femur] par coup de feu exige l'amputation immediate," and, on page 461, adds, that of 25 cases with fracture of the femur treated by expectation, only two recovered with deformed limbs, incapable of fulfilling their functions. MACLEOD (*Notes on the Surgery of the War in the Crimea*, London, 1858, p. 296) advises primary amputation in fractures of the middle and lower thirds of the femur; but where the fracture is in the upper third of the bone he concludes "that slight as the chance of saving life is in any case, it is still our part to attempt consolidation in preference to amputation." LARREY (D. J.) (*Mém. de Chir. Mil. et Camp.*, Paris, 1812, T. II, p. 503) refers to a case of simple shot fracture of the femur without notable lesion of the soft parts for which amputation had been performed on the 40th day, and remarks: "Je ne désapprouve point cette opération; car mon expérience m'a appris que toutes les plaies avec fracture de la cuisse sont tres-fâcheuses, et exigent toutes en général l'amputation qu'on ne peut pas toujours pratiquer dans les premiers momens, et c'est un des cas où elle peut être faite consécutivement."

[5] HEINE (C.) (*Die Schussverletzungen der unteren Extremitaten*, Berlin, 1866, p. 234) declares: "To-day it must be accepted as an axiom that in all cases of shot fractures of the femur by small projectiles, uncomplicated by injury of the femoral artery or by opening of the knee joint, the conservative treatment should by all means be tried."

seventy-six shot fractures of the diaphysis of the femur were found on the returns, furnishing examples of every variety of partial fracture, of comminution of bone, of longitudinal fissuring, of oblique or transverse fracture, and of detachment of large fragments. Of these six thousand five hundred and seventy-six shot fractures of the femur three thousand four hundred and sixty-seven were treated by conservation, and three thousand one hundred and nine were followed by excision either in the shaft of the femur or at the hip joint, or by amputation of the thigh or exarticulation at the hip.

TABLE XX.

Numerical Statement of Sixty-five Hundred and Seventy-six Shot Fractures of the Shaft of the Femur unattended by Primary Injury of the Hip or Knee Joint.

It was found impracticable to eliminate from the large number of cases aggregated in TABLE XX the instances of partial shot fractures of the shaft of the femur, as frequently the diagnosis was too vague to allow a distinction to be made between a complete fracture or a partial fracture. The Army Medical Museum possesses eighteen[1] specimens of partial

[1] *Specimen* 126 (*Cat. Surg. Sect. Army Med. Museum*, 1866, p. 260), the upper part of the left femur, the great trochanter being carried away by a grape shot. *Spec.* 134 (*Cat.*, page 260), upper half of left femur with a section of the shaft just below the great trochanter gouged out: Pt. A. B——, Co. G, 152d New York, aged 34; wounded June 10, 1864; died, of asthenia, August 29, 1864. *Spec.* 1594 (*Cat.*, p. 261), the upper portion of the left femur, with the great trochanter badly grooved by a musket ball: Corporal J. M——, E, 39th Massachusetts, aged 19; wounded at Petersburg, April 1, 1865; died, exhausted after pleuro-pneumonia, August 17, 1865. *Spec.* 2132 (*Cat.*, p. 259), the upper fourth of the right femur, the great trochanter being partly fractured. *Spec.* 2197 (*Cat.*, p. 258), the right femur chipped and contused on anterior and inner face: Pt. G. S——, Co. E, 88th Illinois, aged 27; wounded at Mission Ridge, November 27, 1863; died, from exhaustion, February 18, 1864. *Spec.* 2995 (*Cat.*, p. 260), the upper third of the left femur partially fractured at the level of the trochanter minor: Pt. E. P——, Co. A, 38th Mass., aged 19; wounded at Port Hudson, June 14th; died, from exhaustion, July 27, 1863. *Spec.* 3433 (*Cat.*, p. 259), the upper third of the left femur contused and partially fractured: Pt. W. V——, Co. F, 12th Penn. Cavalry, aged 20; wounded at Winchester, July 24th; died, of typhoid fever, September 29, 1864. *Spec.* 3956 (*Cat.*, p. 261), the shaft of the left femur sawn longitudinally, showing an oblique partial fracture by a conoidal ball, which chipped the shaft in its outer border: Serg't J. O'B——, Co. F, 42d New York, aged 30; wounded at Antietam, September 17, 1862; died, from pyæmia, February 17, 1863. *Spec.* 140 (*Cat.*, p. 260), the lowest third of the left femur grooved two inches above the condyles: Serg't H. D——, Co. E, 2d N. Y. S. M.; wounded at Bull Run, August 30th; died October 10, 1862. *Spec.* 916 (*Cat.*, p. 260), the lower half of the left femur, penetrated in the lowest third, with a slight osseous deposit on the neighboring portion of the shaft: Serg't L. B——, Co. A, 7th Wisconsin; wounded at South Mountain, September 14th; died December 29, 1862. *Spec.* 1104 (*Cat.*, p. 259), the lower half of the left femur severely contused in the lowest third, with an oblique fissure around the bone. *Spec.* 1757 (*Cat.*, p. 261), the lowest third of the right femur obliquely perforated above the external condyle: Pt. M. K——, 4th Ohio Cavalry; wounded July 10th; ligation of popliteal and femoral arteries on account of recurrent hæmorrhage; died, from exhaustion, August 14, 1863. *Spec.* 1788 (*Cat.*, p. 260), the lower half of the right femur partially split, with a longitudinal fragment nearly detached: Pt. O. B. N——, Co. K, 3d Michigan Cavalry; wounded near Jackson, July 15th; died October 2, 1863, of pyæmia. *Spec.* 1924 (*Cat.*, p. 260), the lowest third of the left femur grooved on the outer aspect from before backward: Pt. S. T. G——, Co. E, 17th Kentucky; wounded at Chickamauga, September 19th; died November 5, 1863. *Spec.* 2370 (*Cat.*, p. 261), the lower half of the right femur chipped by a bullet on the outer side; part of the injury repaired by a deposit of callus: Pt. A. R——, Co. A, 2d Penn. Cavalry; wounded at Mine Run, November 29, 1863; taken prisoner, paroled, and admitted into hospital, Baltimore, April 18, 1864; died, May 22, 1864, of pyæmia. *Spec.* 4271 (*Cat.*, p. 261), the lowest third of the left femur, showing partial fracture of the laminated portion of the shaft just above the condyles, with a longitudinal fissure upward: Corp'l J. E. D——, Co. G, 34th Massachusetts; wounded at Newmarket, May 15th; died, with typhoid symptoms, June 5, 1864.

shot fractures of the shaft of the femur. Two instances will here be cited, and then the shot fractures of the femur treated by expectation, according to the seat of the injury in the upper, middle, and lower thirds, will be considered.

FIG. 131.—Partial shot fracture of right femur. *Spec.* 3339.

CASE 359.—Private O. C. Higgins, Co. D, 31st Maine, aged 24 years, was wounded before Petersburg, June 23, 1864. Surgeon J. Harris, 7th Rhode Island, reported his admission into the field hospital of the 2d division, Ninth Corps, with a "shot wound of thigh caused by a musket ball." From the field hospital the wounded man passed to the Depot Hospital at City Point, and thence, on July 3d, to the Third Division Hospital at Alexandria. Surgeon E. Bentley, U. S. V., in charge of the latter, reported the following description of the injury and its result: "A conical explosive ball entered the external aspect of the middle third of the right thigh anteriorly, and, exploding, scattered fragments of lead through the thigh and partially fractured the femur, not, however, preventing the patient from using his leg at will. Water dressings were applied. When admitted the patient was not in good condition, having been suffering from diarrhœa for some time, for which astringents were given. On July 6th, he was somewhat improved. The cold-water dressings were changed to warm. By July 10th the diarrhœal discharges had ceased, but the wound was very much inflamed. On July 15th, a slight discharge of dark and unhealthy pus set in, and flaxseed poultices were applied. Tonics and stimulants were administered. On July 21st, the patient felt better, and his treatment was continued. Two days later there were dark and unhealthy discharges from the wound, but the patient looked bright and his tongue was cleaning. Death occurred suddenly at 4 A. M., on July 24, 1864, the patient having been given water to drink about an hour previously by the nurse, and no signs of rapid exhaustion being then apparent. The *post-mortem* examination, made nine hours after death, showed the thigh filled with fragments of the bullet, and a partial fracture of the femur; there was profuse suppuration above and around the bone, and great emaciation. The viscera were found to be perfectly healthy." The upper two-thirds of the injured femur were contributed to the Army Medical Museum by Dr. Bentley, and are represented in the wood-cut (FIG. 131). The specimen shows the existence of local necrosis, with trivial osseous deposit near by, and the traces of profuse suppuration following the fragments of lead are seen in the roughening of the shaft.

In another instance of partial shot fracture of the shaft of the femur, the ball, at the autopsy, was found lodged in the medullary cavity:

CASE 360.—Corporal J. Higgins, Co. A, 159th New York, aged 19 years, was wounded at Irish Bend, April 14, 1863. Surgeon T. B. Reed, U. S. V., reported his admission to the field hospital of the 4th division, Nineteenth Corps, with a "shot wound of leg." Assistant Surgeon P. S. Conner, U. S. A., contributed the pathological specimen represented in the annexed wood-cuts (FIGS. 132, 133), with the following history: "The patient entered University Hospital, New Orleans, April 17, 1863.

FIG. 132.—Lowest third of right femur, with ball in medullary canal. *Spec.* 1296.

Upon examination he was found to have a wound just below and external to the head of the left fibula, the track of the ball being upward and inward. The missile had not been extracted nor could it be detected. There being no evidence of fracture, the case was regarded as a simple flesh wound and treated accordingly. On the seventh day after admission hæmorrhage supervened, but upon cutting down through the popliteal space no bleeding vessel could be detected, and no further hæmorrhage occurred. On passing the finger along the track of the wound the superior margin of a cavity was felt, which appeared to be a portion of the femur partially split off and thrown backward. There being no displacement or other evidence of fracture extending entirely across the shaft, and the man being unable to give any account of his position at the time of receiving the injury, it was concluded that the ball had lodged in the femur. Though much prostrated by the loss of blood the patient was rallied by careful nursing. As a precautionary measure the limb was placed in an anterior splint after a few days, from which time the case progressed quite favorably until May 15th, when rigors came on and the patient failed rapidly. He died on May 18, 1863, thirty-five days after being wounded. At the *post-mortem* examination no inflammation of the knee joint was discovered, but little pus at the seat of the injury, and no abscesses in the lungs or liver. An inspection of the specimen indicates that the leg must have been strongly flexed on the thigh at the time the man was shot." The specimen shows longitudinal fractures on the anterior surface of the bone, with some periosteal thickening, and the ball lodged in the medullary canal.

FIG. 133.—Anterior view of *Spec.* 1296.

SHOT FRACTURES OF THE SHAFT OF THE FEMUR TREATED BY CONSERVATION.—The shot fractures of the shaft of the femur treated by conservation numbered three thousand four hundred and sixty-seven. The result of the injury could not be ascertained in ninety-four instances. Sixteen hundred and eighty-nine patients recovered, and sixteen hundred and eighty-four, or 49.9 per cent., died. The injury was on the right side in fourteen hundred and thirty-one instances, with a mortality rate of 47.0 per cent.; on the left in sixteen hundred and five, of which 47.1 per cent. died; in four hundred and thirty-one cases the side of the injury was not specified. The seat of fracture

was in the upper third in twelve hundred and fifty-four instances; in the middle third, in eight hundred and fifty-five; in the lower third, in six hundred and twenty cases; and in seven hundred and thirty-eight instances the precise seat of fracture was not stated.

Shot Fractures of the Upper Third of the Femur treated by Conservation.—Very few instances of recovery after shot fractures in the upper third of the femur treated by expectation seem to have been reported by the older authors on military surgery, and I have been unable to find more than eight examples of recovery after this class of injury prior to the beginning of the present century. In the subjoined foot-note[1] an attempt is made to collect the instances of recovery after fractures in the upper third of the femur, to show that in later years these cases have been by no means as rare as has generally been believed, and, indeed, the results obtained in the American Civil War, and, subsequently,

[1] The earliest instance of shot fracture of the upper third of the femur that I have been able to trace is a case reported by Dr. JOSEPH SCHMIDT. In his *Speculum Chirurgicum oder Spiegel der Artzney*, Augspurg, 1656, p. 144. J. von Meda, of Captain Newmann's company, received a shot fracture of the upper third of the femur, August 31, 1648, at Memmingen. He recovered and was able to go about on crutches. PURMANN (M. G.) (*Funfftzig Sonder-und Wunderbahre Schusswunden Curen*, Franckfurt, 1721) reports three cases of recovery after shot fracture of the upper third of the femur, viz: The case of a soldier wounded at Türckshausen, in November, 1671 (Obs. I, p. 32); the case of Corp'l C. Endte, wounded before Stettin in 1677 (Obs. XVIII, p. 213), and the case of M. Leschke, wounded before Wolgarth in October, 1675 (Obs. XXXIII, p. 250). BELLOSTE (*Le Chirurgien d'Hôpital*, 3d ed., Paris, 1716, p. 206) relates the case of Sergeant LeGrand, who received, in 1686, a shot fracture of the upper portion of the right femur, and, after copious suppurations with exfoliations, recovered. The ball and a fragment of the femur were extracted eighteen months after the injury. RAVATON (*Chirurgie d' Armée*, Paris, 1768, p. 338) relates that at the battle of Dettingen, July 5, 1743, a lieutenant of cavalry received a shot fracture of the right lesser trochanter. On the 55th day five pieces of bone came away, and the wound cicatrized without further accident. MOSCATI (*Mém. de l'Acad. de Chir.*, Paris, 1768, T. IV, p. 625) relates the case of a soldier of 35, who, at the battle of Crevelt, June 23, 1758, received a shot fracture just below the trochanters of the right femur. He recovered, and was sent to the Invalides, at Paris, where he died April 13, 1764. Two copperplates well represent the fracture united by large masses of callus. DESAULT (*Jour. de Chirurgie*, Paris, 1792, T. III, p. 104) reports the case of Louis Waymet, shot in Paris, Feb. 28, 1791. The ball passed through both thighs and fractured the left femur in the upper third. The patient recovered and walked well. FENECH (E.) (*Obs. recueillies à l'Armée d'Espagne sur les plaies d'armes à feu aux extrémités*, Paris, Thesis, 1813, p. 10) cites the case of Lieut. Larque, 70th regiment, wounded near the right great trochanter, at Busaco, Portugal, September 27, 1810, and recovered. LEGOUEST (*De la Désarticulation Coxo-fémorale*, in *Mém. de la Soc. de Chir. de Paris*, 1863, T. V, p. 166): M. X—— was shot in the left trochanter in 1812. He recovered with four or five inches shortening, and was presented by H. LARREY, in 1854, to the surgical clinic of Val de Grace. FORGET (*Bull. de la Soc. de Chir. de Paris pendant* 1855-56, p. 230) reports that a captain at Waterloo, in 1815, received a shot fracture of the femur near the trochanter. Pieces of bone continued to come away, and suppuration and fistulæ yet existed in 1852. HENNEN (J.) (*Principles of Military Surgery*, London, 1829, p. 131) states that a French prisoner was brought to Brussels after the battle of Waterloo, June, 1815, whose right femur had been struck by three musket balls, splintering the bone from the middle of the upper third to within two inches of the condyles; enormous suppuration followed, and extensive incisions were made to extract bones and balls, and the patient recovered. Four cases of recovery after shot fractures in the upper thirds of the femur, received in the Paris revolution in 1830, are reported by A. J. JOBERT (DE LAMBALLE) (*Plaies d'armes à feu*, Paris, 1833, pp. 262, 264). LARREY (H.) (*Relation chirurg. des événemens de Juillet*, 1830, Paris, 1831, pp. 102, 106) relates two instances of recovery after shot fracture of the upper third of the femur: Cases of M. de Saint C., and H——, 7th regiment. ARNAL (*Mém. sur quelques peculiarités des plaies par armes à feu*, in *Jour. Hebd. de Méd. et de Chir. prat.*, Paris, 1831, p. 36) reports two cases. A member of the National Guard of Lyon recovered after a shot fracture of the neck of the femur, in 1831 (GENSOUL, *Note sur les blessés reçus à l'Hôtel-Dieu de Lyon, pendant les troubles de* 1831, in *Gaz. Med. de Paris*, 1833, No. 43, p. 300). LARREY (H.) (*Hist. chir. du siége de la Citad. d'Anvers*, Paris, 1833, p. 216) cites four cases of shot fractures of the upper portion of the femur treated successfully during the siege of Antwerp, in 1832. LEGOUEST (*loc. cit.*, p. 167) gives the successful case of Tanguel of the 2d light infantry, wounded in the right trochanter, at Cherchell, in January, 1841. The same author states that SÉDILLOT successfully treated a shot fracture of the right trochanter in a lieutenant of artillery, wounded in a duel in 1843. According to HUGUIER (*Bulletin de la Soc. de Chir. de Paris pendant* 1855-56, Paris, 1856, p. 230), Dr. GERDY successfully treated a shot fracture of the trochanter in 1848. (This is probably the case of Guiton, alluded to in *Gaz. des Hôp.*, 1848, p. 98.) BAUDENS (*Des plaies d'armes à feu—Communications faites, etc.*, Paris, 1849, p. 231) cites a case of shot fracture of the upper third of the femur in 1848; the patient recovered. AMUSSAT (*Des Plaies d'armes à feu—Communications, etc.*, Paris, 1849, p. 55, refers to a case of recovery. During the discussion on disarticulation at the hip at the meetings of the Surgical Society of Paris (*Bulletin de la Soc. de Chir. de Paris*, 1855-56, pp. 230-234), on October 24 and October 31, 1855, GIRALDÉS, ROBERT, and DENONVILLIERS gave details of three cases of recovery after shot fractures of the upper third of the femur. SCHWARTZ (H.) (*Beiträge zur Lehre von den Schusswunden*, Schleswig, 1854, pp. 154 and 167) cites two cases: J. G——, wounded at Altendorf, April 21, 1848, fracture of the great trochanter; fragments of bone removed; recovery. C. B——, of the Berlin volunteers; fracture of trochanter minor; recovery in four months. HUTIN (*Recherches sur le résultat des fractures de la moitié supérieure de la cuisse*, in *Rec. de Mém. de Méd. de Chir. et de Phar. Mil.*, 1854, 2me série, T. XIV, p. 263) found among the inmates of the *Hotel des Invalides* at Paris, from 1847 to 1853, seventeen patients who had recovered from shot fractures of the upper third of the femur. MATTHEW (*loc. cit.*, Vol. II, pp. 361, 362) relates two cases of recovery after shot fracture of the upper third of the femur: An officer of the 17th regiment, wounded September 8, 1855, by a rifle ball, which fractured the trochanter major of the left femur. On November 11th, the bone had united, and there was only slight shortening of the limb. J. Fitzball, 62d regiment, received, September 8, 1855, a shot fracture of the femur at the junction of upper and middle thirds. He recovered, with 1½ inches shortening. LONGMORE (T.) (HOLMES'S *System of Surgery*, 2d ed., 1870, Vol. II, p. 225) details the case of Lieut. D. M——, 19th regiment, who received a shot fracture of the left femur on September 9, 1855. On February 22d, the union of bone was firm. In 1856, "the stiffness of joints gradually disappeared, and the patient was enabled to return to duty." Among the 282 pensioners after injuries of the thigh, recorded by name by M. CHENU in his *Rapport, etc., pendant la Campagne d'Orient en* 1854, 1855, 1856, Paris, 1865, pp. 375-397, 37 cases of recovery are found after shot fracture of the upper third of the femur. From the same campaign, L. BAUDENS (*La Guerre de Crimée*, Paris, 1858, pp. 330, 331, 336) reports a case of recovery after shot fracture of the upper third of the femur among the French troops, not recorded by CHENU: J. Albaric, 80th line, upper third of right femur, Sept. 8, 1855; and two cases of recoveries among the Russian prisoners: Jusef Testanief, left femur, just below the trochanter major, and S. Zarepa, fracture of right femur at the trochanter major. WILLIAMSON (G.) (*Military Surgery*, London, 1863, pp. 141, 142) records six cases of recovery after shot fracture of the upper third of the femur: Private P. Carty, 64th regiment, wounded at Lucknow in 1857. Private J. Ashworth, 53d regiment, wounded November 1, 1857; July 14, 1858, wounds healed. Private J. Hewitt, 52d regiment, wounded July 12, 1857; wounds healed July 20, 1858; and Private E. Collins, 75th regiment, wounded at Delhi, June 8, 1857; September 6, 1858, sent to modified duty; and cases of Williams and Curtis, on p. 151. In the Italian War of 1859, H. DEMME (*Militär-Chir. Studien*, Würzburg, 1864, B. II, p. 365) tabulates 43 cases of shot fractures of the upper third of the femur treated conservatively among the Austrian troops, of which 18 recovered, giving a fatality of 58.1 per cent. Among the French wounded in the same campaign, named by CHENU (*Stat. med. chir. de la Campagne d'Italie en*

in the Franco-Prussian War, 1870-71, have been highly encouraging.[1] From the statistics in TABLE XX, *ante*, it will be seen that of twelve hundred and fifty-four cases of shot fracture of the upper third of the femur treated by expectation, six hundred and sixty-nine recovered, and five hundred and seventy-two proved fatal; while in thirteen instances the result could not be ascertained, giving a mortality of only 46.0 per cent.

Recoveries after Shot Fractures of the Upper Third of the Femur treated by Conservation.—Of the six hundred and sixty-nine cases of this group, two hundred and ninety-eight were on the right, and three hundred and thirty-four on the left side; in thirty-seven instances the side was not specified. Five hundred and fifty-one patients were Union, and one hundred and eighteen were Confederate soldiers.

CASE 361.—Private W. Rigney, Co. G, 21st New York Cavalry, aged 18 years, was shot near Bladensburg, May 27, 1865. Surgeon B. B. Wilson, U. S. V., reported his admission to Stanton Hospital, Washington, May 29th, with "shot wound of right nates and right thigh, fracturing the femur, received while running the guard." The method of treatment, however, was not stated. On September 13th the patient was transferred to Harewood Hospital, whence Surgeon R. B. Bontecou, U. S. V., described his condition as follows: "He was admitted convalescing from a fracture of the upper third of the femur, caused by a revolver ball, the injured bone having firmly united with two inches shortening and very slight deformity. His constitutional condition was good, and he was able to go about on crutches and had good prospects of a useful limb." One month afterwards the man was transferred to De Camp Hospital, David's Island, New York, and on June 26, 1866, he was discharged from service and pensioned. Examiner W. G. Davis, of Lyons, New York, certified, July 1, 1872: "Pistol shot wound of right thigh, the ball entering posteriorly and fracturing the femur just below the trochanter major. There is considerable deformity and two and a half inches shortening. Pieces of bone discharged. Has pain in the limb in damp weather. Cannot rotate the thigh or flex it upon the pelvis, and has pain in it if he works, stands long, or lifts heavy loads." No material changes were

---

1859 *et* 1860, Paris, 1869, T. II, p. 715, etc.), 50 cases of recovery are found after shot fracture of the upper third of the femur treated by conservation. ROUX (J.) (*D'articulation de la cuisse*, Paris, 1860) cites 9 cases of recovery after shot fracture of the upper third of the femur in the Italian campaign of 1859–60, not contained in CHENU'S list, viz: Barka-ben-Brahim, 3d Turks; G. Barbet, 100th line; B. Girel, 65th line; J. Hyvan, 1st Zouaves; J. Labastoule, 15th line; P. Mignucci, 1st Zouaves; J. Pamary, 85th line; F. Rousselot, 5th Battalion; C. Rossignol, 6th line. GHERINI (A.) (*Relazione chirurgica dell' Ospedale militare provisorio di S. Filippo*, in *Annali Universali di Medicina*, Milano, 1860, pp. 459, 460) tabulates 9 cases. MOUAT (*The New Zealand War of* 1863–64–65, in *Stat. San. and Med. Reports for the year* 1865, London, 1867, Vol. VII, pp. 502–3) tabulates 2 cases of recovery. HEINE (C.) (*Die Schussverletzungen der Unteren Extremitäten*, Berlin, 1866, p. 251): J——, shot fracture of upper portion of right femur, April 18, 1864; recovered, with 1¾ inches shortening. From the Austro-Prussian campaign of 1866, B. BECK (*Kriegschirurgische Erfahrungen*, 1867, p. 294) reports 4 cases; STROMEYER (L.) (*Erfahrungen über Schusswunden im Jahre* 1866, Hannover, 1867, p. 53) 3 cases; R. BIEFEL (LANGENBECK'S *Archiv*, 1869, B. XI, p. 445) 1 case; and MAAS (*Kriegschirurgische Beiträge*, Breslau, 1870, p. 40) 3 instances of recovery after shot fracture of the upper third of the femur. GRITTI (R.) (*Nuovi documenti in favore della cura conservativa, etc.*, in *Annali Universali di Medicina*, Milano, 1868, Vol. CCV, p. 518, *et. seq.*) gives details of 10 successful cases of fracture of the upper third of the femur. From various sources it has been possible to collect 264 instances of recovery after shot fractures of the upper third of the femur, received during the Franco-German War of 1870–71. Of these cases were reported among the German forces: By B. BECK (*Chirurgie der Schussverletzungen*, Freiburg, 1872, p. 694), 28 cases; by W. KOCH (*Notizen über Schussverletzungen*, in LANGENBECK'S *Archiv*, 1872, B. XIII, p. 474, etc.), 5; by A. SOCIN (*Kriegschir. Erfahr.*, Leipzig, 1872, p. 134), 6; by G. FISCHER (*Dorf Floing und Schloss Versailles*, in *Deutsche Zeitsch. für Chir.*, Leipzig, 1872, B. I, pp. 185 and 224, etc.), 8; by OTT (*Würtemburg. Med. Correspondenz-Blatt*, 1871, p. 169), 5; by H. FISCHER (*Kriegschir. Erfahr.*, Erlangen, 1872, p. 171, etc.), 4; by CZERNY (*Bericht über die im College Stanislaus in Weissenburg behandelten verwundeten*, in *Wiener Medizinische Wochenschrift*, 1870, No. 57, p. 1373), 3; by A. SCHINZINGER (*Das Reserve-Lazareth Schwetzingen*, Freiburg, 1873, pp. 70, 71), 3; by H. LOSSEN (*Kriegschir. Erf.*, in *Deutsche Zeitschrift für Chir.*, 1873, B. II, p. 112), 2; by TH. BILLROTH (*Chir. Briefe*, Berlin, 1872, p. 228), 2; by KÜCHLER (*Memorabilien*, 1871, B. XVI, p. 141), 2; by GRAF (E.) (*Die Königlichen Reserve-Lazarethe zu Düsseldorf während des Krieges* 1870–71, Elberfeld, 1872, p. 62), 2; and by C. KIRCHNER (*Aerztlicher Bericht über das K. P. Feldlazareth im Palast zu Versailles*, Erlangen, 1872, p. 56), by GUTEKUNST (*Zeitschrift für Wundärzte und Geburtshülfe*, 1870–71, p. 146), by GOLTDAMMER (*Berliner Klinische Wochenschrift*, 1871, B. VIII, p. 150), by STALL (*Bericht aus dem K. Württembergischen 4 Feldhospital*, in *Deutsche Mil. Zeitschrift*, 1874, B. III, p. 197), 1 each; a total of 74 cases among the German troops. Of the cases of recovery after shot fracture of the upper third of the femur among the French troops in 1870–71: SÉDILLOT (*Fractures des membres par armes de guerre*, in *Arch. Gén. de Méd.*, 1871, 6me sér., T. XVII, p. 423, etc.) reports 10 cases; A. W. ROALDÉS (*Des fractures compliquées de la cuisse*, Paris, 1871, pp. 43, 44, 46), 4; A. CHIPAULT (*Fractures par armes à feu*, Paris, 1872, pp. 4, 7, 19, *et seq.*), 3; and WM. MACCORMAC (*Notes and Recollections of an Ambulance Surgeon*, London, 1871, pp. 120, 129), 4; CHRISTIAN (J.) (*Relation sur les plaies de guerre*, in *Gaz. Méd. de Strassbourg*, 1872, p. 283), 4; FELTZ et GROLLEMUND (*Rel. Clin. sur les Ambulances de Hagenau*, in *Gaz. Méd. de Strassbourg*, 1871, No. 11, p. 133), 5; JOESSELL (*Ambulance du Petit Quartier à Haguenau*, in *Gaz. Méd. de Strassbourg*, 1871, p. 8), 3; MOYNIER (E.) (*Ambulance de la Rue Saint Lazare*, in *Gaz. des Hôp.*, 1871, Vol. XLIV, p. 445), 1; PANAS (F.) (*Mém. sur le traitement des blessures*, in *Gaz. Hebd. de Méd. et de Chir.*, 1872, T. IX, p. 391), 2; VASLIN (L.) (*Étude sur les plaies par armes à feu*, Paris, 1872, pp. 114, 120, etc.), 3; and among the pensioners enumerated by M. CHENU (*Aperçu hist. stat. et clin., etc., des armées pendant la guerre de* 1870–71, Paris, 1874, p. 153, *et seq.*), 156 cases are found. Five of these are included in the reports of SÉDILLOT (1), CHIPAULT (2), ROALDÉS (1), MACCORMAC (1), *ante*, leaving 151 additional cases. To these should be added 9 cases of French pensioners reported by MOSSAKOWSKY (*Stat. Bericht ueber* 1514 *Französische Invaliden*, in *Deutsche Zeitschrift für Chir.*, 1872, B. I, p. 342, *et seq.*), not contained in CHENU; and 4 cases of German invalids, detailed by BERTHOLD (*Deutsche Militair-ärztl. Zeitschrift*, 1872, B. I, p. 522). One case is reported by G. TILING (*Bericht ueber die* 124 *im Serbisch-Türkischen Kriege* (1876), *etc., behandelten Schussverletzungen*, Dorpat, 1877, p. 66). The 489 cases of recovery of shot fractures in the upper third of the femur under conservative treatment, here referred to, must convince the reader that recoveries under such circumstances are not as infrequent as the older writers on military surgery contended.

[1] BECK (B.) (*Chir. der Schussverletzungen*, Freiburg, 1872, p. 694, etc.) details 37 cases of shot fractures of the femur in the upper third, of which 28 recovered and 9 proved fatal, and remarks: "Unfortunately, I have not been able to give an entirely precise account regarding the proportion of the seat of the fractures in the various parts of the femur, and the corresponding mortality, as frequently the seat of the fracture was not clearly designated. But I can say this much, that I had reason to be very well satisfied with the results of the fractures in the upper third, providing the lesion was not too extensive and severe. The fractures in the middle third at the junction with the upper always made the most unfavorable impression upon me, on account of the frequent injuries and lesions of the bloodvessels, which, through frequent and even profuse bleedings, etc., easily lead to fatal results, and which should, therefore, be carefully investigated at the place of first dressing, and, if necessary, at once subjected to the proper operation."

reported at subsequent examinations. The pensioner was paid June 4, 1879. Photographs taken at the Harewood Hospital in October, 1865, were contributed by Surgeon Bontecou. (*Photo's of Surgical Cases*, Vol. 8, No. 4, *Card Photo's*, Vol. 3, p. 32.) A copy, taken at the Army Medical Museum (*Photo. Series*, No. 111), is represented in FIG. 1 of PLATE LIX, opp. p. 178.

CASE 362.—Captain D. Lewis, Co. G, 8th Ohio, aged 26 years, was wounded at the Wilderness, May 6, 1864, by a minié ball, which entered the external part of the left thigh about the junction of the upper and middle third, fractured the femur, and made its exit at the left buttock two inches from the anus. He was conveyed to Fredericksburg and treated with a double inclined plane for three weeks. On May 26th he was removed to a private dwelling in Washington, where he was attended by Acting Assistant Surgeon G. K. Smith, who applied Buck's method of treatment. There was but little suppuration or constitutional disturbance, and by July 9th the fracture had so far united as to permit the patient to walk on crutches. On July 13, 1864, Captain Lewis was mustered out by reason of expiration of service, and pensioned. In October following his wound had entirely healed, and soon afterwards he was able to walk on the injured limb. Subsequently he was for some years an employé in the Treasury Department. On August 22, 1865, his photograph was taken at the Army Medical Museum (*Photo. Series of Surgical Cases*, No. 91, A. M. M.), at which time he was in excellent health, and the injured limb showed no other deformity than one and a half inches shortening. The St. Louis Examining Board, in September, 1874, certified to "occasional lameness and soreness." The pensioner was paid March 4, 1879. His photograph is represented in FIG. 1 of PLATE LVIII, opp. p. 180.

CASE 363.—Private John Durkin, Co. G, 11th Infantry, aged 30 years, was wounded at Gettysburg, July 2, 1863, by a conoidal ball, which entered the outer side of the upper third of the left thigh, and, passing obliquely inward and downward, produced a comminuted fracture of the femur. On the 3d he was admitted to the Seminary Hospital at Gettysburg, where, on the 8th, Assistant Surgeon W. R. Ramsey, U. S. A., made an incision three inches in length a short distance below and opposite the point of entrance, and extracted the ball. On the 31st he was transferred to the Camp Letterman Hospital, where, so far as recorded, expectant treatment only was used. At this hospital a surgeon, who took charge of the case on August 19th, "found the limb lying in bed, without either splints or bandage; wounds discharging freely; considerable shortening of leg; ordered junk bags, placed Barton's handkerchief to foot, and made extension and counter-extension." On the next day the leg was reported the same length as the right one. On September 10th there was very little suppuration, and the bones were uniting; but, on the 30th, the discharge still continued, and the patient was reported "sinking." On November 8th, he was transferred to the Newton University Hospital at Baltimore, where, on December 2d, Acting Assistant Surgeon W. S. Smull made an incision, three inches in length, down to the injured part, and removed a small fragment of bone. On February 19, 1864, the wound was still suppurating freely, and presented indications of the presence of necrosed bone. The limb was shortened four inches. The patient was furloughed on June 30, 1864, and at its expiration was admitted to the post hospital at Fort Independence, Boston Harbor, the recruiting depot of the 11th Infantry, where he was discharged the service April 30, 1865, for disability arising from gunshot fracture and "excision of four inches of the upper third of the femur, performed previous to admittance." The wound was still suppurating, and there was partial anchylosis of knee. Prior to his admission to the latter hospital there is no mention of an excision. The patient became an inmate of Old Soldiers' Home; and on August 3, 1868, he visited the Army Medical Museum and had his photograph (FIG. 134) taken. He states that Dr. Smull excised four inches of the shaft of femur at Newton University Hospital in December, 1863; that, at the time of the operation, there was profuse suppuration from the wound and abscesses in the thigh, and that Smith's anterior splint was used. At the date of his visit to the Museum open fistulous sinuses remained. The patient's statement at Fort Independence undoubtedly led to the above diagnosis; and, from the treatment pursued prior to his admission to Newton University Hospital, coupled with the report of the operation made the same month, it is most plausible to believe that the great shortening is not to be attributed to excision. The Boston Examining Board in September, 1873, reported the wound of entrance to be still discharging. The pensioner was paid March 4, 1874, since when he has not been heard from.

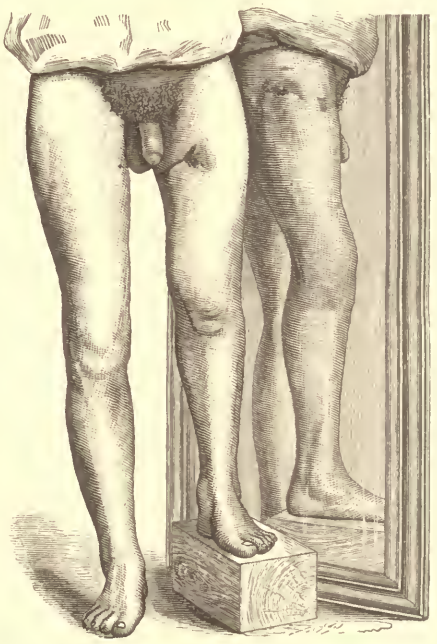

FIG. 134.—Result of shot fracture in the upper third of the femur. [From a photograph.]

CASE 364.—Private A. F. Dinsmore, Co. E, 3d Michigan, aged 19 years, was wounded at Fair Oaks, May 31, 1862, and admitted to Hygeia Hospital, Fort Monroe, four days afterwards. On June 12th the wounded man was transferred on board of the Hospital Steamer Fulton and conveyed to New York. Surgeon J. Simons, U. S. A., reported that he was admitted to De Camp Hospital, David's Island, June 15th, and discharged from service April 9, 1863, by reason of "shot fracture of left thigh." Several months afterwards the man entered the Veteran Reserve Corps, and after serving in that organization for three years he was mustered out and pensioned. Subsequently the pensioner received employment as clerk in the General Land Office, and in December, 1866, he visited the Army Medical Museum, where his photograph was taken (*Photo. Series of Surgical Cases*, No. 157, A. M. M.). At that time he was in good health, though the missile, a musket ball, which fractured the femur at the upper third, was still lodged in the limb. The bone was firmly united, union having occurred, according to his statement, about seven months after the injury, and his treatment having been by moderate extension and counter-extension. He also stated that numerous detached fragments were removed. Examiner J. B. Bascom certified, September 4, 1873: "Gunshot fracture of left femur. The ball remains in the hip. A fistulous opening finally healed, but occasionally breaks out again. There is a large indurated cicatrix over the trochanter major and several smaller ones, caused by the opening of abscesses." The pensioner was paid June 4, 1879. A copy of the photograph is shown in FIG. 2 of PLATE LVIII, opp. p. 180.

CASE 365.—Private H. A. Wiggins, Co. K, 37th Massachusetts, age 24 years, was wounded in the left thigh, at the Wilderness, May 5, 1864. Three weeks afterwards he was admitted to hospital in Alexandria, whence Surgeon E. Bentley, U. S. V., reported the injury as a "shot fracture of the upper third of the femur, caused by a musket ball." In April, 1865, the patient was transferred to Dale Hospital, Worcester, and subsequently to DeCamp Hospital, David's Island, where he was ultimately discharged September 21, 1865, Assistant Surgeon W. Webster, U. S. A., certifying to "angular union of the fractured bone, with five inches shortening; wasting and powerlessness of the limb, and anchylosis of the knee joint. Wound not healed." One month after leaving the service the man was supplied with an apparatus for the injured limb by Dr. E. D. Hudson, of New York City. In a communication, received during July, 1866, and corroborated by a statement by Dr. W. J. Sawin, late Surgeon 2d Vermont, the pensioner related the following in regard to his case: "The ball and eight pieces of bone were removed from my leg on the field, and a second operation was performed at the Fredericksburg hospital, where Surgeon Sawin extracted four pieces of bone." He also alleged that a third operation was performed while he was an inmate of the Alexandria hospital, and that he had recently removed a fragment of bone himself, making altogether some fifty-five pieces that were removed from the limb. Three fistulous openings were described as existing in the injured thigh. The pensioner further represented himself as having been able for two months to move about with the aid of a cane and without crutches, and added that since he was wounded his weight had become reduced from one hundred and seventy-four pounds to one hundred and twenty-nine, and was steadily decreasing. Examiner E. Barton, of Orange, Massachusetts, certified, January 2, 1867: "There is an open ulcer near the hip, from which fragments of bone are frequently discharged; the knee joint is nearly perfectly anchylosed, and from the loss of bone the limb is five and a half inches shorter than the other. The foot is distorted, and he does not know when it is cold. With the aid of an apparatus he walks very comfortably." No new facts were reported at subsequent examinations. The pensioner was paid March 4, 1879. His card photograph, taken at his home in July, 1866, was contributed (*Card Photos.*, A. M. M., Vol. II, p. 21), an enlarged copy of which, taken at the Army Medical Museum (*Surg. Phot. Series*, No. 152), is represented in the wood-cut (FIG. 135).

FIG. 135.—Result of shot fracture of upper third of left femur. [From a photograph.]

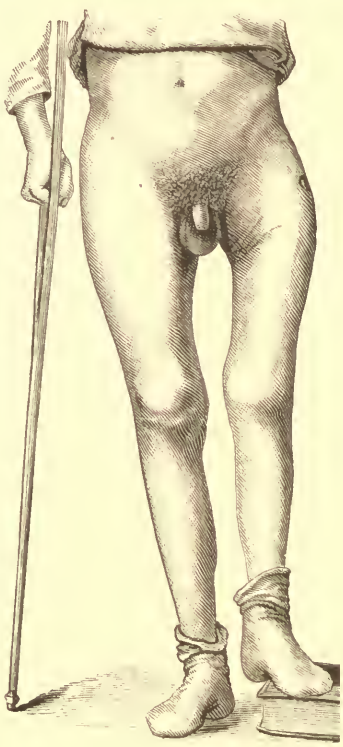

FIG. 136.—Result of shot fracture of upper third of left femur. [From a photograph.]

CASE 366.—Private I. Wetzel, Co. I, 184th Pennsylvania, aged 21 years, was wounded in the left thigh during the siege of Petersburg, October 3, 1864. He was admitted to a field hospital of the Second Corps, and transferred to Armory Square, Washington, five days afterwards. In July, 1865, Acting Assistant Surgeon H. A. Robbins reported the following description of the injury and its result: "A conical ball entered the anterior aspect of the limb one inch below Poupart's ligament, passed backward, fracturing the femur near the trochanters, and made its exit at the apex of the left nates. The limb was treated in Hodgen's splint without extension. The bone is now united with three and a quarter inches shortening; the foot is everted and the limb slightly turned outward. Incomplete anchylosis of the knee joint exists, and there is still a discharge of healthy pus amounting to about one ounce daily. The patient is not yet able to use crutches, but from present appearances he soon will be." The patient was discharged from service on August 21, 1865, and pensioned. Various Pension Examiners, at successive dates, certified to "shortening of the limb and partial anchylosis of the knee;" and in March, 1877, Dr. J. Y. Shindell reported as follows: "I find the left knee joint quite stiff, also evidences of occasional abscesses in the muscular portions of the leg. He says that about once a year matter does form, and that he continually wears bandages around the thigh as a support." In September, 1877, the Examiner stated: "The pensioner's general physical condition is not good. He is now confined to his bed, and has been for the last two weeks, on account of his wound, which is again suppurating. * * * But the greatest trouble now seems to be in the hip joint and its neighborhood. On probing the opening a little above the joint the body of the ilium seems to be of a honey-combed nature, diseased, and, no doubt, the cause of these frequent attacks of suppuration which occur every three or four months. * * * His leg trouble will very likely cause death some time." The pensioner was paid March 4, 1879. The wood-cut (FIG. 136) represents a photograph taken at the Army Medical Museum on July 6, 1865. (*Surg. Phot Series*, No. 67, A. M. M.)

In the next case perfect consolidation of the ends of the fractured femur took place in less than five weeks. The patient recovered with a strong, sound limb, and, in 1879, while engaged in active business, has walked six miles without difficulty, limping but little.

CASE 367.—Lieutenant J. S. Lowery, Co. D, 146th New York, aged 21 years, was wounded at Bethesda Church, June 3, 1864. Surgeon W. R. DeWitt, jr., U. S. V., recorded his admission to a Fifth Corps field hospital, with a "severe wound of the right thigh caused by a minié ball." Surgeon D. W. Bliss, U. S. V., reported that the patient entered Armory Square Hos-

3d Michigan.

pital, Washington, June 7th, and described his injury as a "shot fracture of the upper third of the femur," but gave no account of any treatment but that of simple dressings. Dr. T. M. Flandrau, late Surgeon 146th New York, who attended Lieutenant Lowery at the field hospital, gives the following details: The patient was wounded by a rifle ball while on picket duty. The missile entered at the middle of the thigh, toward its inner aspect, and was cut out on the field by Assistant Surgeon G. H. Fossard, 146th New York, above the trochanter. The femur was fractured in its upper third. The patient was brought six miles on a stretcher to the field hospital of the 2d division, Fifth Corps, where I determined not to amputate, and supported the limb on folded blankets, so that it was very comfortable. He was then carried by some men belonging to the Quartermaster's Department fifteen miles further to the White House, and placed on a steamboat and sent to Washington. He was left on his stretcher while on board of the transport and was not removed from it until placed on a bed in Armory Square Hospital, four days after receiving the injury. At the latter place, Acting Assistant Surgeon T. O. Bannister had immediate charge of the case. According to the patient's statement the limb was placed in a box, little extension being used and no counter-extension. Three or four small pieces of bone were discharged within a short time, and another small piece was cut since from under the skin. An abscess was opened on the outer side of the thigh, the scar of which is conspicuous in the photograph. When the patient left the hospital he used crutches, the wound having closed in four or five weeks and the bone united firmly. He continued to use his crutches until the following April. The limb is shortened two and five-eighths inches; the thigh cannot be fully flexed on the pelvis, but the limb is strong, sound, and freely movable, with the afore-mentioned exception. When wearing a boot slightly thickened in the sole he limps but little. Lately he has walked six miles without difficulty, and is actively engaged in business." In a previous communication Dr. Flandrau stated that the very expeditious recovery of the patient was, no doubt, to be attributed in a large measure to his good fortune of having unusually comfortable transportation. Lieutenant Lowery became a pensioner from the date of his discharge from service, January 13, 1865. Various surgeons have examined him at regular intervals, and certified to lameness, etc., as resulting from the injury, up to April, 1872, since when he has been exempted from further examinations, owing to the permanent character of his disabilities. He was paid June 4, 1879. A photograph of the patient was prepared under the direction of Dr. Flandrau, who contributed it to the Army Medical Museum. It is numbered 265 of the *Surgical Photographic Series*.

In the following instance a rifle ball fractured the upper third of the left femur, and passing through the right thigh chipped off a piece of the upper third of the right femur; a second ball shattered the head of the left fibula; a third ball caused a flesh wound of the leg; and a fourth missile struck over the sacrum:

CASE 368.—Sergeant W. Shakespeare, Co. K, 2d Michigan, aged 18 years, was wounded in both lower limbs at Jackson, July 11, 1863. He was treated at a field hospital of the Ninth Corps for several weeks, and was then transferred by steamer to Cincinnati, where, on August 12th, he entered Washington Park Hospital. On June 1, 1864, the patient was discharged from service and pensioned. Examiner H. O. Hitchcock, of Kalamazoo, Michigan, in March, 1866, furnished the following description of the case: "Shakespeare was struck by a minié ball, which, after passing through the upper third of the left thigh and fracturing the femur, entered the right thigh and either fractured the right femur or perhaps chipped off a piece of bone, making its exit on the outer side of that limb. A minié ball about the same time shattered the head of the left fibula, and another ball produced a flesh wound of the leg; and while lying on the field he was severely wounded by some missile over the sacrum. From this last injury he suffered long and severely. Before being taken from the field several corps surgeons advised amputation of the left thigh, which operation was opposed by Surgeon E. J. Bonine of the regiment, on the ground that it would not add to the chances of recovery. When the patient reached Cincinnati, union of the fragments had taken place, with about seven inches shortening, the fragments crossing each other at a considerable angle and one of them protruding from the wound. Acting Assistant Surgeon A. D. Norton, on August 14th, broke up the temporary union of the parts of the left femur and extended the limb. Three months later, when the case was examined by several surgeons, the parts were still ununited. At present there is complete union of bone, the right leg being one and one-fourth inches shortened, and the left leg one and three-fourths inches shorter than the right. The left femur is a little straighter than normal; the left leg can be flexed upon the thigh to an angle of about 30°; the foot is contracted, rather stiff, and sometimes painful. He suffers considerably from neuralgia, is not as robust as formerly, and walks with the aid of a cane, his gait being rather slow and halting." Several years afterwards the same Examiner reported that the wound in the left thigh frequently opened and discharged pieces of bone and bits of lead. Drs. E. J. Bonine and H. A. Clelland, late Surgeon and Assistant Surgeon of the 2d Michigan, both testify to the injury of both femurs, as well to the fact of amputation having been advised or ordered to be performed at the field hospital, and that the operation was refused or deferred. The former in his report on October 4, 1874, states: "The present condition of the pensioner, as I find by critical examination, is as follows: 'An open, suppurating, and discharging wound in the superior third of the left thigh,' the bone, having been crushed, lapping in the healing, so as to shorten the leg from two to three inches. Bone denuded; partial anchylosis of knee," etc. Examiner Hitchcock, at subsequent dates, lastly in December, 1877, added that "there is a sinus leading down to diseased bone in the left thigh, which is open and discharging more or less nearly all the time. The left knee is nearly anchylosed and is swollen; the foot is tender and the toes are stiffened in a deformed position," etc. The pensioner was paid June 4, 1879. Pension Examiner O. H. Hitchcock presented to the Army Medical Museum a card photograph of the patient (Vol. I, p. 2, *Card Photographs*). A copy is represented in the wood-cut (FIG. 137).

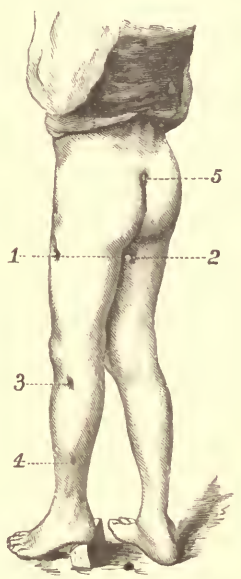

FIG. 137.—Shot fractures of the upper thirds of both femurs. [From a photograph.]

Forty-six of the five hundred and fifty-one Union soldiers who recovered after shot fracture in the upper third of the femur died during the fourteen years that have passed since the close of the American civil war, a fatality of less than 0.6 per cent. a year. In the following two instances the patients survived the injuries eleven and ten and a half years, respectively:

CASE 369.—Corporal T. Crassley, Co. E, 69th New York, aged 34 years, was wounded at Fort Steadman, March 25, 1865, and admitted to the field hospital of the 1st division, Second Corps, where Surgeon F. M. Hammond, 126th New York, noted: "Shot wound of hip by minié ball." Assistant Surgeon C. A. Leale, U. S. V., reported that the wounded man was admitted to Armory Square Hospital, Washington, April 1st, and discharged from service July 25, 1865, by reason of "shot fracture of upper third of right femur, resulting in one inch shortening." The Albany Examining Board, consisting of Drs. R. B. Bontecou, W. H. Craig, and C. H. Porter, certified, September 11, 1873: "The ball entered near the right trochanter, injuring the bone seriously. Numerous portions of bone were removed. The missile passed deeply through the muscular tissue and escaped near the inner border of the right nates. The limb is greatly weakened, and occasionally ulcers appear near the entrance wound, owing to necrosed bone." The pensioner died at the National Military Asylum at Dayton, Ohio, January 8, 1876. The immediate cause of his death has not been ascertained. A photograph, taken at the Army Medical Museum in July, 1865 (*Surg. Phot. Series*, No. 76), is copied in FIG 2 of PLATE LIX, opp. p. 178.

CASE 370.—Private M. Murthra, Co. H, 159th New York, aged 18 years, was wounded in the right thigh, at Irish Bend, April 13, 1863, and admitted to the Marine Hospital, New Orleans, four days afterwards. Surgeon J. Bockee, U. S. V., described the injury as a "compound fracture of the femur at or near the trochanter," and reported that the patient was assigned to the Veteran Reserve Corps March 9, 1864. Surgeon G. Sutton, U. S. V., recorded his entrance into Augur Hospital, Alexandria, with "chronic ulcer," and his transfer to Sickels Hospital several days afterwards. On May 31, 1865, the man was discharged from service, Surgeon E. Bentley, U. S. V., certifying to "great deformity resulting from the fracture." Examiner C. Rowland, of Brooklyn, reported, July 28, 1865: * * * * "Many pieces of bone have been extracted from a large abscess still existing. The leg is three inches shorter than the other and quite lame. He is obliged to walk with a crutch," etc. The pensioner subsequently entered the National Military Asylum at Augusta, whence Surgeon J. O. Webster contributed his photograph in August, 1869, with the following recapitulation of his case: "The wound was caused by a minié ball, which entered the anterior aspect of the thigh in the upper third, emerging posteriorly, nearly opposite, and lodging in the pants. On admission to the hospital the limb was treated by sand bags, and by manual extension once a day. The femur united in bad shape, and another Surgeon coming in charge, it was rebroken and a straight splint applied. He was able to bear his weight on the leg eight months after the injury. The wounds have never healed, and the thigh now discharges in four places. Several splinters of bone have come away. He can walk comfortably with a cane." The Augusta Examining Board certified, August 6, 1873: * * * "The parts being thickly invested by muscles, masses of new bone have been thrown out around the fragments from the surrounding inflamed tissues. Owing to the nature of the fracture, it being greatly comminuted, proper apposition could not be maintained. Masses of new bone were deposited as supports and the splinters enveloped with provisional callus, producing an enlargement of the limb at the point of the fracture. We are of the opinion that superficial exfoliation is going on in some part of the bone on account of the nature and quantity of the discharges, the limb having to be dressed several times during the day. The pensioner has, at short intervals, profuse hæmorrhage from the posterior opening near the ischium. These bleedings are no doubt produced by sharp spiculæ of bone cutting small arteries." The pensioner died December 26, 1873. A copy of his photograph, taken at the Army Medical Museum (*Surg. Phot. Series*, No. 236), is represented in the wood-cut (FIG. 138).

FIG. 138.—Result of shot fracture of femur. [From a photograph.]

In the next case the patient died from extensive inflammation and suppuration of the injured limb, caused by a fall, eleven and a half years after the injury:

CASE 371.—Lieutenant E. L. Postley,[1] Co. D, 176th New York, aged 39 years, was wounded at Winchester, September 19, 1864. Surgeon E. S. Hoffman, 90th New York, reported his admission to the field hospital of the 2d division, Nineteenth Corps, with a "severe wound of the thigh, caused by a minié ball." On September 23d the patient was moved to the Depot Hospital at Winchester, where Surgeon L. P. Wagner, 114th New York, recorded the following description of the injury: "The missile entered the right thigh at the upper third, one and a half inches below Poupart's ligament, passed through the limb outside the femoral vessels, and emerged one and a quarter inches below the trochanter major, fracturing and comminuting the femur. The limb was kept in a splint for ten days, after which some extension was made, and subsequently a sort of a Desault splint was applied for five weeks. No bad symptoms occurred. The wound discharged very freely. Not much bone came out, but some was removed at the time of the injury. By November 27th there was firm union of bone, with two and a half inches shortening and some outward curvature at the seat of the fracture, and the patient was able to throw his leg up." On December

[1] The case of Lieutenant Postley is noticed by Assistant Surgeon JOHN HOMANS, jr., in his article: *Cases of Gunshot Fractures of the Thigh and Wounds of the Chest, showing the Results of Conservative Surgery in the Former*, in *Boston Med. and Surg. Journal*, 1865, Vol. 72, p. 11.

PLATE LV. — TWO VIEWS OF A UNITED SHOT FRACTURE OF THE UPPER EXTREMITY OF THE RIGHT FEMUR OVER 11 YEARS AFTER INJURY.

Case of Lieutenant E. L. Postley, 176th New York.
Spec. 6596, Surgical Section A.M.M.

UNIVERSITY
CALIFORNIA

9th he was transferred to Camden Street Hospital, Baltimore, and in the following month he obtained a leave of absence and proceeded to his home. He was ultimately mustered out April 13, 1865, and pensioned. Examiner J. Neil, of New York City, certified, April 24, 1867: "The thigh is shortened about four inches; the limb is crooked and feeble; he requires the aid of a crutch." The pensioner subsequently entered the National Military Asylum at Hampton, whence Surgeon W. M. Wright reported him, in 1873, as being in good general health, his wound as well healed, and the fractured bone united, with five inches shortening, also that stiffness of the knee joint resulted from extensive adhesions of the muscles of the thigh. Two years afterwards spiculæ were reported to have been removed from the wound, and, on March 6, 1876, Dr. Wright communicated that the pensioner had died on the previous day, stating that "he was able to walk well without the aid of a crutch or cane," and that "two weeks ago he fell, while intoxicated, upon his disabled thigh, which resulted in extensive inflammation and suppuration, from which he died." The greater part of the injured femur, comprising the two upper thirds, was contributed to the Museum by Dr. Wright, and constitutes *Specimen* 6596 *of the Surgical Section*. Illustrations of the bone are shown in PLATE LV, opp. p. 182.

CASE 372.—Corporal E. Worthen, Co. B, 2d Vermont, aged 25 years, was wounded in the right thigh, at the Wilderness, May 5, 1864, and admitted to hospital in Alexandria three weeks afterwards. Surgeon E. Bentley, U. S. V., described the wound as a "shot fracture of the upper third of the femur," but the progress of the case was not recorded. On March 17, 1865, the patient was transferred to Sloan Hospital, Montpelier, whence Surgeon H. Janes, U. S. V., contributed the following history: "The wound was caused by a minié ball, which entered the thigh in front, passed directly through and emerged posteriorly, at the lower border of the glutei muscles, comminuting the femur for about three inches. From the field the wounded man was taken to the hospital of the 2d division, Sixth Corps, at Fredericksburg, and thence by boat to Alexandria, where the limb was first adjusted, and kept in position by sand bags without extension. He stated that no other apparatus was ever used. Subsequently he had typhoid fever and erysipelas. The first fragment of bone was removed in July, 1864, and since that time about fifty pieces have come away. When admitted to Sloan Hospital the wound was still slightly discharging, but the patient was able to go about on crutches. About three months afterwards the bone had become so firmly united that he could walk a short distance without crutch or cane. When discharged from service, June 23, 1865, the patient was in good general health, and able to walk a considerable distance on smooth ground without crutch or cane, the injured limb being shortened two and a half inches and considerably deformed. There was also necrosed bone remaining, and the wound still slightly discharging." Examining Surgeon C. L. Allen, of Rutland, Vt., reported, September 24, 1866: "The right limb is now three inches shorter than the left. An opening (the wound of entrance) still exists in front of the trochanter, into which a probe passes about four inches; another opening posteriorly (the wound of exit) allows the probe to pass in about three inches. A third opening exists near the middle of the inside of the thigh, having been made by the Surgeon for the discharge of the burrowing pus." The same examiner subsequently certified that he was called on to visit the pensioner on October 23, 1870, and found him "suffering from pyæmia, resulting from the wound breaking out anew, from the effects of which he died October 25, 1870." A card photograph of the patient, taken at the Sloan Hospital, was contributed by Surgeon Janes (*Card Photos.*, A. M. M., Vol. II, p. 22), an enlarged copy of which, taken at the Army Medical Museum (*Surg. Phot. Series*, No. 129), is shown in wood-cut (FIG. 139).

FIG. 139.—Result of a shot wound of upper third of femur. [From a photograph.]

FIG. 140.—Shot fracture of upper third of right femur. [From a photograph.]

CASE 373.—Private G. Ruoss, Co. G, 7th New York, aged 27 years, was wounded near Petersburg, March 31, 1865, and admitted to the field hospital of the 1st division, Second Corps, where Surgeon F. M. Hammond, 126th New York, noted: "Shot fracture of right thigh." On the day following the injury the wounded man was sent to the Depot Hospital at City Point, and several days afterwards he was conveyed to Washington, where he entered Campbell Hospital, and subsequently Stanton Hospital. Surgeon R. B. Bontecou, U. S. V., reported his admission to Harewood Hospital September 12th, and his condition as follows: "The patient was suffering from great deformity of the right limb, the result of a shot wound of the upper third of the thigh, fracturing the femur. When admitted he had so far recovered as to be able to sit up, and his constitutional state was tolerably good. The fractured parts had firmly united but with great deformity; the wound of entrance had healed, but there were still some discharges from sinuses in the thigh, and small fragments of necrosed bones were daily removed. The prospects of usefulness of the limb are unfavorable; otherwise the patient is doing tolerably well." At the closing of Harewood Hospital, May 1, 1866, the patient was transferred to the Post Hospital at Washington, where he was operated on by Assistant Surgeon W. Thomson, U. S. A., who described the injury and operation as follows: "The wound was caused by a minié ball, which entered on the anterior and outer aspect of the thigh about three inches below the great trochanter, passed inward and a little downward, comminuting portions of the upper and middle thirds of the femur, and escaped posteriorly near the middle of the gluteal fold. On June 8th, the patient was etherized and a triangular incision, three by three and a half inches, was made on the upper and outer side of the thigh, and several pieces of bone were removed. On September 30th the wound had almost healed. Three sinuses, evidently

leading to necrosed bone, however, still existed, two of which were located on the upper and one on the lower surface. The patient's health was not very good, having suffered from several attacks of diarrhœa, and a severe attack of erysipelas which commenced near the wound and soon spread over the entire surface of the leg and foot. On December 31st, the sinuses were still open and discharging, and there was great deformity, with about five inches shortening, and almost complete anchylosis of the knee joint." Assistant Surgeon J. Brooke, U. S. A., who took charge of the patient in November, 1867, reported the termination of the case: "I found the limb in much the same condition as described by Dr. Thomson, except that a collection of pus, which had formed on the inner aspect of the thigh just above the knee, had been opened and a sinus found to connect with the seat of the fracture. This sinus, as well as those already described by Dr. Thomson, remained open, and the patient continued extremely feeble, became greatly emaciated, and suffered much from diarrhœa and frequent attacks of almost total loss of appetite. These symptoms continued until his death, which occurred on June 27, 1868. At the *autopsy* the liver was found to be enormously enlarged, weighing ten pounds and ten ounces, and the right lung contained a small mass of calcareous matter." The injured femur, with the os innominatum and patella attached, and portions of the tibia and fibula were contributed to the Museum by Dr. Brooke, and constitute specimen 5450 of the Surgical Section. The femur is imperfectly united, with great displacement and a deposit of foliaceous callus, and shows that extensive periostitis has taken place, and the patella and upper portions of tibia and fibula also show similar pathological changes. The photograph represented in the wood-cut (FIG. 140) was obtained at the Harewood Hospital, and contributed by Surgeon Bontecou. Other photographs of the patient, taken at the same hospital and at the Army Medical Museum, are represented by No. 40, Vol. 8, of *Photo's of Surgical Cases, S. G. O.; Card Photo's*, Vol. 2, p. 21, and Vol. 3, p. 27, and *Surgical Photograph Series*, Nos. 139, 178, 179, and 292.

Fatal Cases of Shot Fractures of the Upper Third of the Femur treated by Conservation.—Of the twelve hundred and fifty-four cases of shot fractures of the upper third of the femur tabulated in TABLE XX, on page 175, *ante*, five hundred and seventy-two proved fatal. Four hundred and eighty were Union and ninety-two Confederate soldiers. The side on which the injury was received was noted in four hundred and eighty-one instances, the right side being involved in two hundred and nineteen, the left, in two hundred and sixty-two cases. A few fatal examples will be cited:

CASE 374.—Private J. Northrup, Co. K, 77th New York, aged 21 years, was wounded before Yorktown, April 29, 1862, and entered the Douglas Hospital, Washington, May 15th. Assistant Surgeon W. Webster, U. S. A., forwarded the specimen (FIG. 141), and recorded the following history: "The wound was caused by a conoidal ball, which entered on the outer side of the lower portion of the upper third of the left thigh, and was extracted through the gluteus maximus muscle on a level with and two inches from the anus, same side. The missile produced a compound fracture of the femur at the upper third and shortened the limb to the extent of two inches. On admission, the patient, who was of robust and healthy appearance, had considerable fever and constipation of the bowels. There was extensive swelling of the integuments, and he was suffering acute pain. Vedder's long splint was applied, and extension from the ankle and counter-extension by a perineal band was made. By these means the limb was lengthened one inch and retained in that position. The acute pain rendered any further extension impracticable. The patient was ordered to take one-half ounce of castor oil, and sulphate of morphia at night to relieve the pain. May 18th, the wound has been dressed with poultices of flaxseed meal; the swelling has somewhat subsided and there is no fever. The pain continues, and to relieve it and promote sleep a mixture of two drachms of elixir of opium and one ounce of camphor water is given in two doses every evening. June 2d, the discharge has ceased and the external wound is nearly closed. There are some signs of union and of the deposition of abundant provisional callus. June 10th, the splint was removed; the shortening of the limb now amounts to three inches. June 16th, the patient was this morning attacked with chills and the initiatory symptoms of fever, a frequent and very weak pulse and red tongue, also great tenderness in the epigastric region, with frequent vomiting. The above symptoms continued without intermission until terminated in death, at 11 o'clock P. M., on June 18, 1862. The *autopsy*, ten hours after death, confirmed the previous diagnosis of acute gastro-enteritis. The coats of the stomach were found to be intensely congested, with disorganization of the mucous membrane, which appeared to be greatest about the greater curvature of the stomach. The fracture was found firmly consolidated, with abundant deposition of provisional callus." The specimen consists of the upper half of the fractured femur, showing partial union at right angles and the shaft roughened by the action of pus, also callus somewhat copiously thrown out and entangling the fragments, but the inner surfaces being carious.

FIG. 141.—Left femur shattered below trochanters. *Spec.* 27.

FIG. 142.—Shot fracture of left femur. Callus without union. *Spec.* 1810.

CASE 375.—Private F. Smith, Co. C, 121st New York, was wounded at Fredericksburg, May 3, 1863. Surgeon E. F. Taylor, 1st New Jersey, noted his admission to the field hospital of the 1st division, Sixth Corps, with "shot wound of thigh," and his transfer to general hospital June 13th. Surgeon A. Heger, U. S. A., contributed the specimen, shown in the adjoining wood-cut (FIG. 142), with the following description of the case: "The patient was wounded by a round ball, causing fracture of the left femur at the upper third. He was admitted to hospital at Point Lookout, June 14th, very much reduced, abscesses and sinuses extending through the whole thigh from the pelvis to the knee. He

PLATE XXV. SECONDARY INFLAMMATION OF THE KNEE JOINT.

Case of Pt William Zilliox F 29th New York

UNIVERSITY OF CALIFORNIA

seemed to gain a little strength, but died July 11, 1863, from exhaustion." The specimen consists of a portion of the femur with the missile attached. The bone was shattered below the trochanters and shows considerable effusion of callus, but no union seems to have occurred.

CASE 376.—Private *M. Sullivan*, Co. K, 6th Louisiana, aged 30 years, was wounded at Antietam, September 17, 1862, and admitted to hospital at Frederick two weeks afterwards. Assistant Surgeon R. F. Weir, U. S. A., recorded the following history: "The patient was wounded by five balls. The first entered about one and a half inches above and a little inside of the left patella, and, passing through, fractured and comminuted the femur, and emerged on the outside about three and a half inches above the knee joint. The second ball entered the left thigh near the junction with the perinæum, merely making a flesh wound. The third entered about three and a half inches below and a little posterior to the trochanters of the right thigh, fracturing the femur, and, going directly through, emerged at the junction of the thigh with the perinæum. The fourth missile produced a flesh wound, entering just over the junction of the dorsal and lumbar vertebra, and was not found; and the fifth grazed the left thigh posteriorly at the junction of the upper and middle thirds. After the battle he was carried to the White House Hospital, where his limbs were placed in long board splints, and in that condition he was sent to the Seminary Hospital at Frederick, where the splints were removed and Buck's apparatus was substituted, with two bricks on each leg for extension. No bone was extracted. Two abscesses formed, one near the right knee, which was opened and discharged copious quantities of bloody pus. The wounds in the right thigh also discharged considerable quantities of curdy matter. The second abscess was opened near the first and the discharge was similar in character. While in the Seminary the patient's treatment consisted of tonics and stimulants. On January 15, 1863, when admitted to hospital No. 1, both limbs were very much swollen, and tight bandages were ordered to be applied. On the 17th an abscess made its appearance on the posterior part of the right thigh just below the buttock, and the ball, which had entered the back and could not be discovered at first, was taken out with two pieces of bone, one being about two inches long and one and a half inches wide, and the other a small fragment. 23d, the limbs are slowly improving and are considerably reduced in size, the left leg measuring thirty-three inches and the right one thirty-two and a half inches; general health tolerable; treatment consisting of iron and quinine, with generous diet. 28th, opened an abscess on left side of left knee; abscess under right thigh gradually healing. 30th, a bloody sanious pus is being discharged from the abscess in the left knee, and the burrowing includes a space of about eight inches square. Introduced a tent into the opening of both abscesses. The patient's bowels being rather costive, three compound cathartic pills were given. February 1st, abscesses looking well and gradually filling up with healthy granulations; patient slowly improving. 9th, general condition not so good; has some hectic fever at night, also diarrhœa. Abscesses healing and limbs appear to be doing well. 17th, slowly improving; appetite better. Discovered a sinus leading from the external wound of the left thigh posteriorly, at the bottom of which there is some necrosed bone. 21st, abscess on knee cicatrized; small abscess making its appearance on the anterior aspect of the upper third of left thigh; discharge from sinus increased; wound on right thigh discharging considerable healthy pus. Patient had a chill this morning. His bowels being constipated, castor oil was prescribed. March 3d, improving. Abscess on under surface of upper third of right thigh is closing up, but a portion of the necrosed femur is yet felt by the probe. The left thigh is discharging healthy pus, and from its external wound an abscess opened extending about two inches, from which there is now protruding a large portion of necrosed bone, which will be removed by exsection as soon as the patient's health will permit. 13th, general health improving; sinus discharging as usual. Wound in posterior aspect of thigh probed and found to be very extensive; necrosed bone apparently covered by healthy granulations. April 5th, patient rapidly improving; has an excellent appetite; bowels regular. Wounds on posterior aspect of right thigh entirely closed and the other wounds doing well. 15th, patient has had a severe attack of erysipelas in his left leg, also a high fever and attacks of vomiting; leg much inflamed and greatly swollen. It was painted with tincture of iodine and lead and opium wash was applied. Stimulants were also ordered. 20th, considerable swelling of the knee joint. Urine was drawn off, he being unable to pass it. 22d, patient much worse. An incision was made near the right knee joint and a large quantity of pus discharged. The urine was again drawn off. Death occurred April 22, 1863. *Post-mortem* examination five hours after death: On opening the chest pleuritic adhesions were found on both sides; lungs healthy and partially covered with seropurulent lymph; liver highly congested and fatty and weighing fourteen ounces; kidneys weighing eight ounces, of light color, and external surface mottled; heart healthy and weighing eight ounces." The pathological specimens represented in the wood-cuts were contributed to the Museum by Acting Assistant Surgeon G. M. Paullin. FIGURE 144 shows the right femur united with two inches shortening after fracture in the upper third, a large fragment being bound fast, a small sequestrum nearly loose, the ends well rounded, and the lower extremity diseased as far as the condyles. The other specimen (FIG. 143) consists of the lower third of the left femur; showing a fracture firmly united by profuse bone deposits, with lateral deformity and two and a half inches shortening, the lower fragment forming an angle with the shaft of about fifteen degrees forward.

FIG. 143.—United shot fracture of lowest third of left femur. *Spec.* 3882.

FIG. 144.—United shot fracture of upper third of right femur. *Spec.* 3881.

CASE 377.—Private William Ziliox, Co. F, 29th New York, aged 31 years, was wounded at Chancellorsville, May 3, 1863. He was standing erect and in the act of firing. The missile, a conoidal ball, entered the outer and middle portion of the left thigh, passed upward, fractured the femur, and lodged in the surrounding muscles. He was left on the battle-field and fell into the hands of the enemy, and received no treatment until his return within our lines, May 15, 1863. He was then admitted into the field hospital of the Eleventh Corps, at Brook's Station, where his leg was dressed in splints. On June 14th, he was admitted into the Lincoln Hospital, Washington. Assistant Surgeon H. Allen, U. S. A., reports: "When admitted his affected

limb looked as though no extension had been employed. The ball had not been extracted, there was no union, and there was four and a half inches shortening. Acting Assistant Surgeon D. Weisel, under whose care the patient was placed, removed the splints and applied the anterior splint. This treatment was continued until June 20th, when, suppuration becoming so great, fear was entertained of pus burrowing toward the hip joint, and it was discontinued, and sand bag supports and extension, produced by a bag of stones suspended by a rope run through a pulley and attached to the base of the foot, substituted. The case progressed favorably. August 1st, small abscesses appeared near the knee, not, however, troublesome. There was little burrowing of pus. August 7th, Dr. Weisel opened a small abscess on the posterior portion of the thigh immediately behind the seat of fracture. August 26th, several spiculæ of bone were extracted through this opening, together with the bullet, which was flattened and contorted to a very irregular form. Early in September, the pus was observed extending down the inner side of the thigh and opening two inches above the internal condyle of the femur. By pressure pus could, at any time, be made to pass out of this opening, it, no doubt, communicating with the injury above. The constitutional symptoms were still favorable. October 1st, effusion in the knee joint of the corresponding side was first noticed; the skin over the joint had an erysipelatous hue, and the joint was swollen. It was at first thought that the opening on the inside of the thigh communicated with the joint, and that pyarthrosis was caused thereby; but it was afterwards thought to be a case of suppurative arthritis and in no direct way connected with the pus-producing surface about the seat of fracture. From the first appearance of this complication the patient sank rapidly, the tongue became dry and brown, the stomach rejected all aliment; hiccough was a constant and distressing symptom. Severe pain was experienced in the limb. These signs of constitutional exhaustion continued without relief until the day of his death, October 6, 1863." The secondary inflammation of the knee joint is shown in PLATE XXV, opposite p. 184. The fractured femur, showing fractures in the upper third, large deposits of callus, but without union, is *Spec.* 1761 of the Surgical Section, A. M. M. (FIG. 145.)

FIG. 145.—Shot fracture of upper third of left femur. *Spec.* 1761.

FIG. 146.—Shot fracture of right femur below trochanters. *Spec.* 233.

CASE 378.—Private W. Reed, Co. H, 83d Pennsylvania, aged 29 years, was wounded and captured at Gaines's Mills, June 27, 1862. He remained in the hands of the enemy for a month, when he was paroled and conveyed to Philadelphia. Acting Assistant Surgeon R. P. Thomas, in charge of the Episcopal Church Hospital, recorded the following description of the wound and its result: "The ball entered the outer side of the right thigh about five inches below the anterior superior spinous process of the ilium, fractured the femur, and made its exit on a horizontal line with the point of entrance and five inches from it. The man entered this hospital on July 30th in a miserable condition. The thigh was much shortened, and an opening formed in the buttock within four inches of the wound of exit, discharging very freely and resulting from the passage of a piece of bone. The patient was also suffering from diarrhœa and a diphtheritic exudation in the mouth and fauces. He was taking stimulants and chlorate of potassa. Death resulted on September 26, 1862, from pyæmia and exhaustion. The *post-mortem* showed no metastatic abscess. The femur was found to be extensively fractured high up and to consist mainly of two fragments, around the free ends of which and adherent to them were several other pieces of large size. The specimen, represented in the cut (FIG. 146), was contributed by Acting Assistant Surgeon A. C. Bournonville, and shows considerable deposit of callus imprisoning the larger fragments and affording partial union.

CASE 379.—Private *E. Vehorn*, Co. F, 13th South Carolina, was wounded at Gettysburg, July 3, 1863, and was treated in hospital at Chester. Acting Assistant Surgeon B. Brinton contributed the specimen, shown in the annexed cut (FIG. 147), and described the injury as a "shot wound of the right hip, fracturing the femur near its neck. Patient died of exhaustion October 13, 1863." The specimen consists of the upper portion of the femur, showing oblique fracture through the lesser trochanter, with a moderate deposit of callus, but without union.

FIG. 147.—Shot fracture of left femur through lesser trochanter. Callus without union. *Spec.* 2070.

CASE 380.—Private T. Manley, Co. A, 63d New York, aged 26 years, was wounded at Gettysburg, July 2, 1863, and admitted to Camp Letterman one month afterwards. Acting Assistant Surgeon R. S. L. Walsh described the injury as a "compound fracture of the upper third of the right femur," and reported: "There is no history of the case previous to admission. The general health of the patient is good; the wound discharging profusely. Tonics and stimulants were given, and the limb treated by the double-inclined plane. The patient did tolerably well for some days, but his general condition became worse about August 31st." Acting Assistant Surgeon J. Newcombe, into whose hands the case passed on September 4th, reported the following termination: "On taking charge of the patient he was sinking rapidly. The fracture was disunited and the limb was shortened about five inches. The patient was also troubled with profuse night sweats and had a large bed-sore on his back. He died September 8, 1863, of exhaustion. At the *post-mortem* examination the fractured ends were found overlapping each other, the lower being, as usual, drawn upward and inward by the adductor muscles, while the upper was carried forward by the psoas and iliacus and outward by the external rotators. The fracture ran obliquely upward and inward, and considerable callus had been thrown out on the inner side only. A false joint had formed between the fragments, the lower playing in a rude socket formed by the upper, and both being covered by a dense, smooth, glistening, and apparently fibrous membrane." The pathological specimen (FIG. 148) consists of the upper portion of the injured femur, and was contributed by Acting Assistant Surgeon E. P. Townsend.

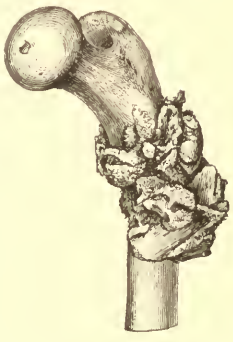

FIG. 148.—Shot fracture of right femur below trochanters. Callus without union. *Spec.* 1935.

Shot Fractures of the Middle Third of the Femur treated by Conservation.—Eight hundred and fifty-five cases of shot fracture of the middle third of the femur treated without operation were collected from the registers in this Office. In thirteen instances the result could not be ascertained; five hundred patients recovered and three hundred and forty-two died, a mortality of 40.6 per cent.

Cases of Recovery after Shot Fractures of the Middle Third of the Femur treated by Conservation.—The five hundred cases of recovery after shot fracture of the middle third of the femur included four hundred and twenty-one Union, and seventy-nine Confederate soldiers. In two hundred and eight cases the injury was on the right, and in two hundred and sixty-seven on the left side:

CASE 381.—Private J. H. Green, Co. E, 14th New York Heavy Artillery, aged 46 years, was wounded at Bethesda Church, June 2, 1864, and admitted to the field hospital of the 1st division, Ninth Corps, where Surgeon M. K. Hogan, U. S. V., recorded: "Gunshot fracture of right thigh." Two days afterwards the wounded man was moved to the Depot Hospital of the Ninth Corps, and on June 14th he reached Washington. Acting Assistant Surgeon H. A. Robbins reported: "He was admitted to Armory Square Hospital, having been wounded by a conoidal ball, which entered the anterior aspect of the right thigh at a point above the junction of the middle and lower thirds, producing comminuted fracture, and made its exit at a point on the posterior surface opposite to that of entrance. The limb was treated in Hodgen's splint without extension. During the month of March, 1865, several spiculæ of bone were removed, varying in size, the longest being two and a half inches in length. These were extracted without enlarging the opening. The patient came under my care June 1, 1865. The bone is now united with five and a half inches shortening. The femur is bowed out and the foot is considerably inverted. The knee joint is considerably stiffened, so that it can only be flexed to an angle of about twenty degrees. About one ounce of healthy pus is now discharged during twenty-four hours. The patient's health is very good." On July 6th he was brought to the Army Medical Museum, when the photograph, shown in the cut (FIG. 149), was taken. On the following day he was transferred to the Ira Harris Hospital at Albany, whence Assistant Surgeon J. H. Armsby, U. S. V., contributed a cast of the injured limb (*Cat. Surg. Sect.*, 1866, p 535, *Spec.* 1356). The patient was discharged from service October 3, 1865, and pensioned. Examiner S. L. Parmelee, of Gouverneur, New York, certified, September 4, 1873: "The ball entered five inches above the knee, anteriorly, fracturing the femur, and splitting, with two points of emergence, on the posterior aspect of the thigh. Result: Stiff knee; femur curved outward at an angle of twenty degrees," etc. At a subsequent examination substantially the same was reported. The pensioner was paid March 4, 1879.

FIG. 149.—Shot fracture of middle third of right femur. [From a photograph.]

CASE 382.—Private W. D. Gilbert, Co. C, 6th Vermont, aged 20 years, was wounded in the right thigh at the Wilderness, May 5, 1864. Three weeks afterwards he arrived at Alexandria and entered the Mansion House Hospital, whence Surgeon C. Page, U. S. A., reported the injury as a "shot fracture of the middle third of the femur." Subsequently the patient was transferred to Sickels Hospital, and lastly to Sloan, Montpelier. Surgeon H. Janes, U. S. V., in charge of the latter hospital, contributed the following history: "The patient, a man of strong constitution, was wounded by a minié ball, which passed through the thigh at the junction of the middle and lower thirds, comminuting the femur for several inches. The day after the injury he was sent by ambulance to Fredericksburg, no retentive apparatus having been applied, and two weeks later he was moved by cars and boat to Alexandria, the limb being kept in a fracture-box during the trip. At Alexandria, it was put upon an anterior splint and extension was made by brick and pulley. In June several pieces of bone were removed. Suppuration was profuse, and about August 1st his appetite failed and he became so much debilitated that his life was despaired of. After this he gradually but slowly improved, though not without occasional relapses. On January 1, 1865, the splint was removed and the patient allowed to sit at the bedside, and no retentive apparatus was used for more than two or three days after that time. About the last of January he could walk about the ward on crutches, though unable to bear any weight upon the limb. On March 17th the patient was transferred to this hospital, during which journey the limb became considerably inflamed, resulting in his confinement to bed for three days. On May 29th the limb, having again become inflamed and discharging very offensive pus, was freely opened for

FIG. 150.—Shot fracture of middle third of right femur. [From a photograph.]

about four inches, and several large pieces of necrosed bone, one of which measured one by three inches, were removed. The cavity in the callus, which contained these fragments, was found to be large and seemed to extend quite or nearly to the cancellated structure of the condyles. After the operation suppuration became healthy and the wound mended rapidly for four weeks, when the improvement became checked. On September 7th, the limb was again laid open freely and a small piece of bone was removed, after which there was no further interruption in the progress of the patient up to October 12, 1865, when he was discharged from service. At this time the wound still suppurated to the amount of two ounces per day, and a considerable cavity existed between the ends of the bone, but no necrosis could be detected by the probe. The limb was shortened three inches, and there was ligamentous anchylosis of the knee joint, permitting the patient to move it about ten degrees. He was in general good health, able to bear half his weight on the injured leg for a short time, and seemed to have a fair prospect of obtaining a useful limb. There had been no hæmorrhage, gangrene, or diarrhœa since the injury, and his appetite had been good nearly all the time, having taken nutritious food freely and stimulants moderately." Examiner W. McCollom, of Woodstock, Vermont, November 14, 1866, certified to the injury, and stated: "The bone has united with three inches shortening. Exfoliations are thrown off occasionally, and the wound in the soft tissues has not entirely healed. He is totally disabled from performing manual labor at present." Examiner O. W. Sherwin stated, September 4, 1873: "There is considerable loss of tissue, and the knee is permanently flexed so as to keep the heel two inches from the floor," and, in September, 1877, he reported the following: "During the present year a large abscess formed at the seat of the injury, with exfoliation of bone. I attended him during two months of confinement in bed from the aforesaid cause." A card photograph of the patient, taken at the Sloan Hospital, was contributed by Surgeon Janes (*Card Photos*, A. M. M., Vol. 2, p. 22), an enlarged copy of which, taken at the Army Medical Museum (*Surg. Phot. Series*, No. 130), is represented in the cut (FIG. 150). The pensioner was paid March 4, 1879.

CASE 383.—Lieutenant J. Buckley, Regimental Quartermaster of the 140th New York, aged 22 years, was wounded at Spottsylvania, May 8, 1864, by a minié ball, which fractured the right thigh at the middle third. From the field he was, on May 12th, admitted to hospital at Alexandria, and five days afterwards he was transferred to the Seminary Hospital, Georgetown. Surgeon H. W. Ducachet, U. S. V., in charge of the latter, reported the character of the injury and that the patient remained under treatment until November 12th, when he obtained a leave of absence and departed for his home. On January 13, 1865, Lieutenant Buckley was mustered out of service and pensioned. Dr. T. M. Flandrau, formerly Surgeon 146th New York, who saw this officer at the time of the injury, and also after he left the service, communicated his observations in March, 1870, as follows: "I decided to save the limb, and, aided by Surgeon H. C. Dean, 140th New York, dressed it in Smith's anterior splint, suspending it from the bows of an army wagon, in which, with his servant steadying the foot, he was carried to Belle Plain. When he reached the Georgetown Hospital the thigh was found shortened five inches. During the second, third, and fourth months after the injury he was treated by an extension weight of sixteen pounds, a counter-extending band, and lateral sand bags. On August 20th he had three profuse hæmorrhages, jeopardizing his life, which were controlled without operation. He used crutches when leaving the hospital, but threw them aside five months afterwards. He has since been employed as a bookkeeper. There is two and a half inches shortening, and the knee is somewhat stiffened. A fistulous opening still exists on the back of the thigh and discharges a little. The limb is very useful, and the limp is not conspicuous." The Utica Examining Board reported, January 3, 1872: * * * "There has been extensive exfoliation of bone, leaving several deep cicatrices, and there is still an open sinus extending to the bone and attended with bloody sanious discharge, indicating that there is still disease of the bone," etc. Examiner C. B. Coventry, September 6, 1873, certified to several pieces of bone having been removed, some of them since the previous examination. The pensioner was paid March 4, 1879. FIG. 1 of PLATE LX, opp., is a representation of a photograph of the pensioner, taken in Rome, New York, March, 1870, which was contributed by Dr. Flandrau, and copied at the Army Medical Museum. (*Surg. Phot. Series*, No. 266, A. M. M.)

CASE 384.—Private J. Hamilton, Co. I, 1st Delaware, aged 19 years, was accidentally shot, while on picket duty at Camp Hamilton, November 24, 1861. On the following day he was admitted to Hygeia Hospital, Fort Monroe, whence Surgeon R. B. Bontecou, U. S. V., reported: "Gunshot fracture of right thigh, above the middle, by a conical ball. The bone, though considerably comminuted, finally united at the expiration of five weeks; suppuration and exfoliation kept up with occasional intermission until June, 1862. The wounds were, at times, dilated with sponge tents to keep them free. Constant slight extension was used, and some portions of bone were removed from time to time. On June 14, 1862, the patient was discharged from service, and sent home with limb sound and shortened not more than an inch." Examiner D. W. Maull, of Wilmington, Delaware, certified to "shot fracture of the femur and shortening of the limb, with pain and occasional suppuration." A Pension Examining Board reported, in September, 1877: "An inch shortening; deep cicatrices; one of the wounds has been suppurating within six weeks, when a piece of dead bone came out." The pensioner was paid June 4, 1879. Photographs of the patient were furnished by Surgeon Bontecou (*Photos. of Surgical Cases*, Vol. 8, No. 54, and *Card Photos.*, Vol. 2, p. 21, and Vol. 3, p. 22), an enlarged copy of which (*Surg. Phot. Series*, No. 119) is represented in FIG. 2 of PLATE LX, opp.

CASE 385.—Sergeant A. Ryder, Co. B, 121st New York, aged 22 years, was wounded before Petersburg, April 2, 1865, and admitted to the field hospital of the 1st division, Sixth Corps, where Surgeon R. Sharpe, 15th New Jersey, noted: "Shot fracture of left thigh; splints applied." On the day following the injury the wounded man was sent to the Depot Hospital at City Point, and, on April 12th, he was transferred to Armory Square Hospital, Washington, whence Acting Assistant Surgeon G. K. Smith reported the following history: "The wound was caused by a conoidal ball, which struck the femur about six inches above the patella, fracturing the shaft of the bone and lodging. But slight constitutional disturbance took place, and the quantity of discharge from the wound was very moderate. The position of the ball could not be ascertained. The patient was treated on Dr. Gurdon Buck's plan. Two weeks after his admission, the injured limb was found to be shortened one and one-quarter inches. By June 9th the wound had healed, but bony union was still incomplete and extension by weights was continued. On July 8th the femur was found to be firmly consolidated, and the patient was allowed to go about on crutches. He was mustered out of service August 2, 1865, his general health being good and his injured leg shortened less than an inch." Examiner J. C. Tibbets, of Warsaw, New York, certified, October 14, 1872: "The ball passed through the rectus muscle, fractured the bone, and lodged in the posterior part of the thigh among the muscles, where it still remains. The muscles in the

UNIVERSITY
CALIFORNIA

back of the leg and thigh are contracted, so that walking or even much resting on the limb causes spasms (cramps), etc." The pensioner was paid March 4, 1879. His photograph, taken at the Army Medical Museum on July 25, 1865 (*Surg. Phot. Series*, No. 72), is represented in FIG. 1 of PLATE LXI.

CASE 386.—Private J. Friederick, Co. F, 127th New York, aged 19 years, was wounded in the right thigh at Honey Hill, November 30, 1864. Assistant Surgeon J. F. Huber, U. S. V., reported his admission to hospital at Hilton Head, on the day following the injury, with "compound fracture of femur, treated with splints," and his transfer to Washington, May 7, 1865, but gave no account of the progress of the case. The following notes were furnished by Acting Assistant Surgeon G. K. Smith, from Armory Square Hospital, and by Assistant Surgeon W. Webster, U. S. A., in charge of DeCamp Hospital, David's Island, New York. The wound was caused by a round ball, which entered the inner side of the thigh at its middle third, passing obliquely outward and forward, fracturing the femur and lodging. An attempt to stand on the limb after receiving the injury caused the thigh to bend to an obtuse angle at the seat of the fracture. The wounded man was placed on a shelter tent and conveyed to a steamboat, about eight miles distant, no examination of the wound having been made and no local support having been applied to the broken bone. During the night following the injury the ball was removed through an incision on the external aspect of the thigh. Cold-water applications were used, and a partial support was given by an arrangement of blankets around the parts. On arriving at the Hilton Head Hospital a surgical examination was made under chloroform, but with no operative result, the limb being exceedingly tumefied. Smith's anterior suspensory apparatus was then applied, and the topical applications of cold water were continued. This treatment was kept up until January 7th, when side splints, extending below the foot, were substituted, and the limb was maintained in a straight position. This apparatus was continued for nearly two months, and during this stage of the treatment the swelling greatly subsided, and about a half dozen pieces of bone were removed by the attending surgeon at various intervals. The largest of these is represented to have been about three inches long, one-half inch wide, and one-eighth inch thick. An abscess also opened, spontaneously, about two inches below Poupart's ligament. In the latter part of March the side splints gave way to a fracture-box, the cold-water dressings being still persevered in. On May 1st all local supports by means of splints were cast aside, bandages and pillows being sufficient from that period in consequence of the advanced stage of bony consolidation. On May 10th, when the patient was admitted to Armory Square Hospital, the fractured femur had firmly united, with seven inches shortening, a marked deformity by an outward curvature of the thigh, and very limited motion of the knee joint. There was still a slight discharge, and the extremity of the upper fragment lapping by the lower fragment presented itself on the outer aspect of the limb, close to the external condyle, at which point the skin was ulcerated through, exposing the end of the bone. By June 1st the patient's recovery was so far advanced as to enable him to walk about the ward with the aid of crutches. About the last of June, however, he was compelled to resume his bed in consequence of the appearance of an abscess on the outer side of the thigh, which was opened and gave exit to about eight ounces of sanious and offensive pus. Up to this time the purulent discharges from the wound had been moderate in quantity and healthy in character. On July 5th, however, the several openings were attacked by gangrene, which rapidly extended up the thigh and destroyed the skin and superficial and deep fascia nearly the whole length of its external surface. This disease was, at length, arrested by the application of bromine, and by August 15th the wound had become filled with granulations, and cicatrization was progressive. On August 17th the patient was transferred to Douglas Hospital, where a subsequent exploration of the limb resulted in the removal of six small sequestra from the external wound. Simple dressings were now used, and no further operative interference was required in the case until after the arrival of the patient at DeCamp Hospital, where he was transferred on October 23d. At this date he was strong enough to walk from the steamboat landing to his ward on crutches, and his general health was excellent. There were three apertures, two on the external and one on the posterior surface of the thigh, from which pus of a healthy appearance found exit in small quantities. An examination of the wound by means of a probe revealed secondary splinters, but not sufficiently approachable to warrant an attempt at their removal. The amount of new osseous deposit was considerable, but unfortunately the sequestra were found so intimately embedded in it as to cause their removal to be attended with great difficulty and even impossibility, and involving the sacrifice of so much new growth as to endanger the limb. On February 25, 1866, however, the further removal of necrotic pieces was induced by constitutional symptoms, which manifested themselves and indicated local irritation. Portions of the involucrum were removed by the trephine and chisel, where necessary for the purpose, and small masses of dead bone were extracted from each of the orifices. One of the pieces, deeply situated, measured about two inches in length. As a seeming consequence of the operation the unfavorable constitutional symptoms entirely disappeared, and the condition of the patient and his wounds became highly satisfactory." In June following he was supplied with an apparatus for the injured limb by E. D. Hudson, of New York City, and four months later he left for his home, having been discharged from service November 25, 1865, but re-admitted to the hospital one month afterwards. The Examining Board of Augusta, Maine, certified, in May, 1873, and in December, 1876: "The leg is withered and badly deformed, and there are discharging ulcers all the time. He can perform no manual labor of any kind, and is confined to his bed a large part of the time. The leg, from knee to foot, is nothing but skin and bone." The pensioner was paid June 4, 1879. The wood-cut (FIG. 151) represents a photograph of the patient, taken August 15, 1865. (*Photo's of Surgical Cases*, Vol. 9, p. 16, and *Surg. Phot. Series*, No. 90.)

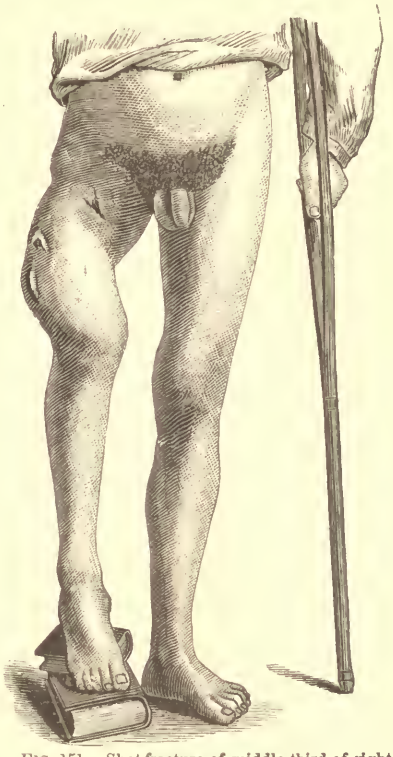

FIG. 151.—Shot fracture of middle third of right femur. [From a photograph.]

Card photographs, taken at a subsequent date at the DeCamp Hospital, were contributed by Assistant Surgeon Webster. (*Card Photo's*, Vol. 2, p. 22, A. M. M.)

CASE 387.—Private T. Miller, Co. G, 116th Pennsylvania, aged 18 years, was wounded at the Wilderness, May 5, 1864, and admitted to Armory Square Hospital, Washington, three weeks afterwards. Surgeon D. W. Bliss, U. S. V., described the injury as a "fracture of the upper third of the left femur, caused by a minié ball," but the progress of the case, further than an attack of pleuro-pneumonia, in March, 1865, was not reported. On August 15, 1865, the patient was transferred to Harewood Hospital, whence Surgeon R. B. Bontecou, U. S. V., reported the following history: "When admitted he was convalescent from a wound of the thigh, the missile entering and fracturing the femur at the junction of the upper and middle thirds, passing through and coming out on the inner side, near the tuberosity of the ischium. According to the patient's statement his constitutional condition at the time of the injury was very good, although the wound was very painful. Severe hæmorrhage followed the injury, with great tumefaction of the whole limb. The fracture box was used and counter-extension, and the treatment was supporting throughout. The patient had so far recovered as to be able to be about on crutches. The thigh had shortened about two inches and three-fourths; but otherwise the man was in good condition and in a fair way of having a useful limb." Two weeks afterwards he was transferred to Mower Hospital, and subsequently to the Post Hospital at Philadelphia, and in October he was finally sent to Harrisburg to be mustered out, his term of service having expired July 14, 1865. An apparatus for the injured limb was furnished on December 6, 1865, by J. M. Gemrig, of Philadelphia. Dr. J. A. McArthur, Surgeon of the Soldiers' Home, Philadelphia, October 17, 1866, certified to anchylosis of the knee joint as resulting from the injury, and described the wound as still open and requiring treatment. The Philadelphia Examining Board reported "almost complete anchylosis of the knee," in September, 1873, and two years afterwards the same Board stated: "The femur is curved antero-posteriorly—concavity forward. There are several scars on the front of the thigh, where spiculæ were removed, and the muscular structure of the thigh is much wasted. He alleges constant pain in walking." The pensioner was paid June 4, 1879. A photograph of the patient, taken at the Harewood Hospital in October, 1865, was contributed by Surgeon Bontecou, and copied at the Army Medical Museum. (*Photos. of Surgical Cases*, Vol. 8, No. 142, and *Surg. Phot. Series*, No. 114, A. M. M.) A representation is shown in FIG. 2 of PLATE LXI, opp.

CASE 388.—Private H. Shetter, Co. D, 7th Wisconsin, aged 30 years, was wounded at Gravelly Run, March 31, 1865, and admitted to the field hospital of the 3d division, Fifth Corps, where Surgeon A. S. Coe, 147th New York, recorded: "Fracture of middle third of right thigh by a minié ball." On the second day after the injury the wounded man was moved to the Depot Hospital at City Point, and several days later he was sent to Washington. Acting Assistant Surgeon G. K. Smith reported the following history: "The patient was admitted to Armory Square Hospital April 5th. The missile had entered the external portion of the thigh, producing fracture and lodging. On April 19th, a small opening ulcerated through the skin on the inner side of the thigh, about two inches below the perinæum, through which the ball was removed by the forceps. The limb was bandaged in its whole length and laid upon a mattress, being supported by sand bags and extended by weight and pulley. On July 5th the patient was able to ride about the ward in an invalid chair, and a few days later he walked on crutches. By July 16th the bone had firmly united, with only one inch shortening, though there was still a slight discharge from the wound. The patient's general health was remarkably good." He was subsequently transferred to Harvey Hospital, Madison, and ultimately discharged from Camp Randall November 15, 1865, Acting Assistant Surgeon A. W. Greenleaf certifying to "shortening and total loss of power and strength of the limb." Examiner A. J. Ward, of Madison, Wisconsin, on September 8, 1873, reported over three inches shortening of the limb and anchylosis of the knee joint; and two years later he stated that the pensioner "will never be any better." The pensioner was paid March 4, 1879. FIG. 2 of PLATE LXII, opp. p. 192, is a copy of a photograph of the patient, taken at the Army Medical Museum on July 16, 1865. (*Surg. Phot. Series*, No. 71, A. M. M.)

CASE 389.—Private H. E. Gumberts, Co. E, 136th Indiana, aged 18 years, was shot in the left thigh, at Camp Carrington, May 13, 1864. Acting Assistant Surgeon J. M. Kitchen reported his admission to hospital at Indianapolis on the day of the injury, and described the wound as a "fracture of the femur, caused by a musket ball." The patient was discharged by reason of expiration of service September 2, 1864, and subsequently he was placed on the Pension Rolls. In January, 1866, Dr. Kitchen communicated that he received a letter from the man stating that he could "run and jump as well as ever," and representing "the injured limb, with the exception of a little shortening, just as good and useful as the other." Examiner H. M. Harvey, of Evansville, Indiana, certified, August 12, 1871: "The ball entered the thigh about midway between the knee and hip joints, on its outer aspect, passed inward, backward, and slightly downward, fracturing the shaft of the femur in its course, and emerging on the inner side of the limb. There is a large amount of callus around the seat of the fracture, and the limb is shortened about one and one-quarter inches. He complains of pain in the knee joint, and cannot completely flex the leg upon the thigh." At a subsequent examination the pain in the knee was reported to be increasing. The pensioner was paid June 4, 1879. His photograph was obtained in July, 1866, and contributed by Dr. Kitchen to the Museum, where it was copied. (*Surg. Phot. Series*, No. 153, A. M. M.) A representation of it appears in FIG. 1 of PLATE LXII, opp. p. 192.

Of the four hundred and twenty-one Union soldiers discharged the service on account of shot fracture of the middle third of femur, thirty-three have died in the course of fourteen years since the close of the war, and one committed suicide. In the following two instances the patients died nine and twelve years after the reception of the injury:

CASE 390.—Captain R. T. Shillinglaw, Co. I, 79th New York, aged 32 years, was wounded in the left thigh, both upper extremities, and the right temple, at Bull Run, July 21, 1861. The injury of the thigh was caused by a conoidal ball, which fractured the femur obliquely at the middle third. He was made a prisoner and conveyed to Richmond, where the fracture was treated at the Alms House Hospital, by a Desault splint for one week, and by Smith's anterior splint for twelve weeks subsequently. Slight suppuration continued for nearly a year after the injury, with occasional elimination of bits of necrosed

bone. Having been exchanged on December 31, 1861, he proceeded to his home in New York City, where he was treated, for a time, by his family physician. Some months afterwards he returned to the field, and served as Acting Aid-de-Camp to General Wilcox until January 20, 1863, when he resigned the service. In August following, Captain Shillinglaw was commissioned in the Veteran Reserve Corps, in which organization he remained until August 2, 1865, when he was finally mustered out and pensioned. After leaving the service he took up his residence in Washington City, and obtained employment in the U. S. Treasury Department. The photograph, represented in the annexed cut (FIG. 152), was obtained in June, 1866, when he visited the Army Medical Museum. At that time the injured limb was shortened nearly three inches, but he could walk briskly and without a limp. He used no cane and experienced little or no inconvenience from his wounds. Examiner J. Phillips certified, February 6, 1869: "Gunshot wound of left thigh, left arm, right hand and arm, and right temple. Compound comminuted fracture of thigh bone. The bone has united crookedly, and is about three inches shorter than its fellow; the muscles are attenuated, and the nerves of the limb so affected that he is constantly suffering. Gunshot wound of left elbow joint; ball lodged near the joint, which is now so weakened as to be unserviceable for labor. Flesh wound of right hand from piece of shell. The right arm was pierced by a piece of shell, scraping the bone. This wound impairs the usefulness of the limb. A ball struck the right parietal bone. He suffers but little from this wound." This pensioner died April 14, 1870, of consumption, superinduced by an attack of pleuro-pneumonia and gunshot wounds.

FIG. 152.—Shot fracture of middle third of left femur. [From a photograph.]

CASE 391.—Private J. Moran, Co. K, 25th Ohio, aged 22 years, was wounded at Bull Run, August 30, 1862, and admitted to hospital at Alexandria four days afterwards. Surgeon E. Bentley, U. S. V., reported: "A ball entered on the anterior side of the left thigh, at the top of the middle third, passed though the limb, fracturing the bone, and emerged on the inner side of the thigh, at the bottom of the middle third. The patient was treated by rest and position, and the bone united with considerable shortening. He was discharged from hospital January 30, 1863." The man subsequently joined the Veteran Reserve Corps, and was ultimately discharged from service March 28, 1865, and pensioned. Examiner S. S. Thorn, of Toledo, Ohio, October 3, 1865, certified to the "shot fracture of the femur, followed by three and a half inches shortening, anchylosis of knee, and impaired power of limb;" also to "the wound being still open and exfoliating bone." Examiner S. M. Smith, of Columbus, one year later reported the injured femur as affected with necrosis, and Examiner T. A. Reamy, of Cincinnati, in September, 1873, describes the "muscles firmly adherent to the bone at the point of the injury, an open sinus communicating with the bone anteriorly, and great angular deformity at the union of the fractured bone." The attending physician of the pensioner certified that he died November 11, 1874, of debility superinduced by necrosis of the injured femur, which was attended by continued exfoliation and suppuration.

Fatal Cases of Shot Fractures of the Middle Third of the Femur treated by Conservation.—Three hundred and forty-two cases of shot fracture of the middle third of the femur treated by conservation had fatal terminations. Eighty-six were Confederate and two hundred and seventy-four Union soldiers:

CASE 392.—Private J. Shimrock, Co. A, 55th Ohio, aged 20 years, was wounded at Chancellorsville, May 3, 1863. Surgeon G. Suckley, U. S. V., reported that he was left in the hands of the enemy, and described his injury as "a shot fracture of the femur." Twelve days after being wounded the man was paroled and admitted to the Eleventh Corps field hospital at Brook's Station, and one month later he was transferred to the Stanton Hospital at Washington. Surgeon J. A. Lidell, U. S. V., contributed the specimen (FIG. 153) and made the following report of the case: "Examination at the time of admission showed that the right femur was broken near the junction of the lower with the middle third, and that union had not yet taken place. There was a copious discharge of thin pus from the wound of the soft parts. The fracture had been treated in a simple straight fracture-box, and the limb was still in it when the patient was brought to this hospital. He stated that the bullet had not yet been extracted from the wound. He was pale, thin, and weak, with a frequent pulse. His tongue was smooth, dry, and red, and he complained of diarrhœa, but said this was an old affair, and that he had also had chills and fever some time back. The prognosis was very unfavorable. The broken limb was placed in Hodgen's splint; pills of camphor and opium were given to control the diarrhœa, and the system was supported with a nourishing diet, using eggs, milk, beef tea, farina, etc., together with milk-punch. June 18th, diarrhœa checked; tongue continues red and smooth; has considerable irritability of the stomach. The pills were suspended, but the supporting treatment continued. 22d, secondary hæmorrhage from the wound, to the extent of about three ounces, occurred this morning; there was also slight bleeding yesterday, some branch of the profunda being the probable source. Two drachms of solution of persulphate of iron was injected into the bottom of the wound through a catheter, and the hæmorrhage did not again occur. 24th, complained of pain in the thigh, was restless, and had some diarrhœa. Gave one-grain opium pills every four hours until the 26th, when the diarrhœa was again checked. Suppuration continued profuse; tongue smooth and red. July 2d, patient appeared to be slowly failing. Fluctuation having been detected above the internal condyle of the femur, an incision was made and about two ounces of pus evacuated. Two grains of quinine was prescribed three times a day, and six ounces of whiskey daily was substituted in place of the milk-punch, which, the patient thought, did not agree with him. 8th, patient began to exhibit night sweats, with increase of pallor and anæmia; suppuration profuse, unhealthy and fetid; necrosed bone at the bottom of the wound firmly impacted. 18th, had a chill, followed by a hot and sweating stage. Administered ten grains of quinine three times a day: chills did not return for four days. 20th, patient very pale

and feeble, with smooth red tongue; in addition to quinine he takes muriated tincture of iron, and porter two pints daily, with nourishing diet. 21st, diarrhœa returned and was checked by pills of opium. 22d and 23d, chills occurring at irregular intervals, associated with hot flushes and profuse perspiration. 25th, some unhealthy fetid pus was evacuated from the inner side of the thigh by incision. 27th, had pyæmic rigors and sweats again; is much emaciated and very pale; pulse 120 and feeble; tongue glazed and of bright red color. 29th, continuance of pyæmic rigors and sweats, the perspiration being very profuse; left leg and thigh œdematous and blue colored, the superficial veins looking like dark blue knotted cords; all of which denotes obstruction of the left iliac and femoral veins. The patient continued to sink, and died of exhaustion on July 31, 1863. *Post-mortem* twenty hours after death: Fracture of right thigh firmly united; necrosed bone closely surrounded by involucrum; muscles of right thigh extensively infiltrated with pus. The missile, a conical and much flattened bullet, was found at the lower and inner side of the thigh. The femoral artery opposite the seat of the injury contained an oval-shaped clot of blood (embolus) which completely occluded it; no other abnormity of the artery was noticed. On examination of the left thigh a metastatic abscess was found in the popliteal space containing about an ounce of pus, and the external iliac and femoral veins were discovered to be distended with coagulated blood. The femoral and iliac veins of the injured limb appeared to be normal. The liver was somewhat enlarged, nutmegged and fatty; kidneys beginning to be granular; spleen enlarged, softened, and reddish brown in color; lungs containing some frothy serum, otherwise natural; left ventricle of heart containing some coagulated blood." The specimen consists of the lower half of the injured femur with a battered piece of lead attached, and exhibits a fragment four inches long by one and a half wide, which preserved the vitality of its periosteal surface. The effusions from this fragment connect, as a bridge, the broken shaft; its internal surface is carious. Besides this, other and smaller fragments are entangled in the newly formed bone, some of which are necrosed and some serve as bonds. A wet preparation of portions of the common and external iliac and femoral arteries of the right side, showing an embolus in the latter near the seat of the fracture of the thigh, was also contributed by Surgeon Lidell,[1] and constitutes Specimen 3454 of the Surgical Section of the Army Medical Museum.

FIG. 153.—Fracture of right femur at junction of middle and lower thirds. *Spec.* 1536.

CASE 393.—Corporal W. Ford, Co. B, 1st Colored Regiment, aged 20 years, received a shot wound at Petersburg, June 15, 1865, and was conveyed to Baltimore twelve days afterwards. Surgeon L. W. Read, U. S. V., reported his admission to McKim's Mansion Hospital with "shot fracture of left thigh." On July 25th, the patient was transferred to Hick's Hospital, whence Assistant Surgeon G. M. McGill, U. S. A., forwarded the specimen, shown in the annexed cut (FIG. 154), with the following account of the case: "The patient suffered with a wound of the left thigh. The ball had entered the posterior part of the outer aspect of the middle third, passing inward, forward, and slightly upward, and lodged. It was sought for several times but could never be detected. A large detached piece of necrosed bone was taken out of the opening of entrance during the month of September, 1865. The patient complained of continual pain, aggravated by pressure in both lumbar regions, in which regions there was extended flatness on percussion. He continued very weak, had several attacks of erysipelas, and finally sank, after a severe attack, on February 20, 1866. The injured thigh was greatly swollen, its skin shiny and somewhat tuberculated about the sinuses and slow-healing incisions. The diagnosis of fatty degeneration (interstitial formation and proper) was made for the left thigh and leg and inferred for the great organs. Ford was a long time dying: For seventy hours or more his death was expected from hour to hour. Before death the surface of his body, in appearance, was waxen. The left leg and foot were gangrenous. There was a tumor (result of periosteal action) of the diaphysis of the left femur. The ball (much flattened) was found beneath the sartorius muscle and vessels in the middle third of the thigh. There was pus in the left knee joint, in the left hip joint, and in the superficial fascia of the left leg. No disease of the vessels was observed." The specimen consists of the left femur, obliquely fractured in the middle third and partly consolidated by an excessive deposit of new bone on the posterior surface, the adjacent surfaces being carious, with a necrosed fragment remaining at the upper portion.

FIG. 154.—Oblique fracture of left femur in middle third. *Spec.* 255.

FIG. 155.—Left femur fractured in middle third. *Spec.* 1043.

CASE 394.—Private C. Hill, Co. K, 7th Michigan, was wounded at Antietam, September 17, 1862. Surgeon G. Chaddock, 7th Michigan, reported his admission to the Stone House Hospital, near the battle-field, with "shot wound of the thigh." Surgeon B. A. Vanderkieft, U. S. V., forwarded the specimen, shown in the wood-cut (FIG. 155), with the following history: "The patient was wounded by a musket ball, which passed through the middle third of the right thigh, fracturing the femur. He came under my care six weeks after the injury, there being no previous history other than his statement that a small piece of bone was extracted a few days after the reception of the wound. On account of the normal appearance and length of the leg, the slight suppuration, the absence of other fragments and of any crepitation whatever, I diagnosed an incomplete compound fracture of the thigh, such as is often the result of an injury by a spherical ball received at short distance. (Patient stated that he distinctly saw the man who shot at him.) His general condition was very satisfactory. The fractured limb presented two fistular openings, one on the inner and the other on the outer side of the thigh at the middle third, and discharging but little pus. There was no shortness whatever, and if there had been a complete

[1] Dr. LIDELL, in an article on *Thrombosis and Embolism*, in the *American Journal of Medical Sciences*, 1872, Vol. LXIV, N. S., p. 343, gives a minute account of this important case.

UNIVERSITY
CALIFORNIA

division of the bone consolidation had already followed. The limb was placed between two sand bags, acting as splints, and a plain dressing was applied. A very nourishing diet was prescribed. By the 17th of December the patient was doing very well; the inner fistular opening was closed, while the one on the outside was still of the same dimension, but discharging an ichorous pus mixed with small pieces of bone in the form of sand, such as is often noticed in caries of the long bones. On January 9, 1863, notwithstanding the continuation of the discharge of the aforementioned character, the patient felt well enough to sit up a short time in an arm-chair, but, on returning to his bed, he accidentally fell down, and, owing to the fragility of the injured parts, he fractured the same precisely at the corresponding point of the passage of the ball. Notwithstanding the most careful attendance no consolidation could be obtained, the whole femur seeming to be in a state of molecular disorganization, and having lost its normal firmness even as in rachites. The discharge of ichorous pus increased daily, and the patient died of exhaustion on March 19, 1863, no signs of pyæmia having been noticed. The use of phosphate of lime against the existing osteomalacia did not afford the slightest relief. According to the patient's statement, there was no constitutional predisposition." The specimen consists of the injured femur, and shows the formation of an immense sequestrum in the lower half and disease of the lower two-thirds of the shaft.

CASE 395.—Sergeant T. Bechtold, Co. C, 93d Pennsylvania, aged 34 years, was wounded at Fair Oaks, June 1, 1862, and entered Hygeia Hospital at Fort Monroe nine days afterwards. Surgeon R. B. Bontecou, U. S. V., reported: "He received a shot while in line of battle, the ball entering the anterior and middle third of the right thigh, and making its exit nearly opposite on the posterior portion of the limb; and while on the ground he was hit again by a conical ball, which entered the back below the inferior angle of the scapula and was cut out in the axilla. On June 12th, secondary hæmorrhage from the wound in the axilla set in, which continued from time to time for four days, when it was finally controlled by pressure and plugging. The thigh was swung up in Smith's anterior splint, and imperfect union took place under unfavorable circumstances, the patient being very much emaciated and suffering from bedsores and diarrhœa. He was sent to his home in August, 1862, and I learned that he subsequently died from the exhausting suppuration, which, from the first, kept up from the thigh wound. Sequestra were removed whenever discovered, and the fascia of the thigh relieved to prevent burrowing." The patient died at Lebanon, Pennsylvania, on September 24, 1862, whence the specimen represented in the wood-cut (FIG. 156) was contributed by Dr. B. F. Schenk. The specimen embraces a portion of the fractured femur, and shows a remarkable instance of reparative effort. The fragments are thoroughly involved with callus, and a large sequestrum is nearly detached. There is also an accidental *post-mortem* fracture of the specimen one inch below its superior border.

FIG. 156.—Portion of right femur fractured in middle third. *Spec.* 370.

CASE 396.—Private *Tobias Bever*, Co. C, 57th North Carolina, aged 30 years, was wounded and taken prisoner at Rappahannock Station, Virginia, November 7, 1863. Surgeon John A. Lidell, U. S. V., reported: "The bullet entered the left limb one and a half inches to the inner side of the inner margin of the patella, passed upward and outward, fractured the femur five or six inches above the knee joint and lodged; its locality could not be ascertained. He was admitted into Stanton Hospital November 9th, his general condition being favorable. The synovial pouches were apparently unopened. The limb was placed in Hodgen's splint and a moderate amount of extension applied; the wound was kept wet with cold water. Some synovial effusion into the cavity of the joint occurred on November 21st, but no other untoward symptoms were present. November 30th, doing well, wound healing, but little effusion in the knee joint; general health good; bullet still unextracted. December 1st, the external wound is healed; there is a hard substance, feeling like a portion of bone, or perhaps the ball, to be felt in the outer and back part of the thigh at a point corresponding with the fracture. December 25th, femur united and quite strong. The ball still remained in the limb, and its location was not surely known. On January 1, 1864, the extension was discontinued. He could move the limb very well; the amount of shortening was two inches, which was occasioned by overlapping at the seat of fracture. His general health was excellent, and he was out of bed almost every day, and appeared to be doing well until February 1, 1864, when the wounded thigh had become swollen (not circumscribed) and painful. Ordered to stay in bed for the purpose of resting the limb and to apply a lotion of lead and opium. The tumefaction of the thigh partially subsided on February 14th, but the lymphatic glands of the groin had become swollen, painful, and tender. March 2d, the swelling about the track of the bullet has increased and is very painful. Fluctuation is also detected. The cicatrix of the wound is tense and puffy; incised it and evacuated about two ounces of laudable pus. March 3d, the pain has ceased and the swelling has partially subsided. The discharge from the wound is thin, straw colored, and flaky. Directed the tincture of iron to be continued, with the addition of six ounces of whiskey daily. On March 20th, the swelling and soreness of the thigh had again increased. The discharge continued free. There was also diffuse redness of the skin, extending from the wound up the inner side of the thigh. He was pale, anæmic, and felt very weak. Stimulants were directed to be continued, with such articles of diet as he could take. It was now apparent that he would not recover without amputation of the thigh, but we were compelled to await the subsidence of the diffuse inflammation of the soft parts in order to perform that operation with any hope of success. March 22d, the discharge continues copious. It is thin and there is some blood mixed with it. He is somewhat emaciated and slowly failing in strength. March 24th, copious hæmorrhage from the wound, apparently parenchymatous in character, occurred this morning, and about half a pint of blood was lost before it could be controlled. Injected about two ounces of solution of persulphate of iron through a catheter carried deep into the wound, after which there was no more external hæmorrhage. The loss of blood reduced him very much. He gradually sank, and died on the morning of March 27, 1864. At the autopsy, in dissection, great œdema of the areolar tissue of the thigh was found. There was a large cavity beneath the fascia lata and surrounding the seat of fracture. It extended from the synovial pouches of the knee joint up to the trochanter major. It was lined with a moderate amount of plastic exudation. It contained about a quart of dark colored blood mixed with some pus. At the bottom of it, and toward the inner side of the femur, a minié ball was discovered. A piece had been split off from the side of it which could not be found. The medulla of the femur above the fracture was found to be bright red in color and soft in consistence. It presented the appearance described by Virchow as the 'red inflammatory marrow' (osteomyelitis). The fracture was firmly but irregu-

larly united. Examination of the specimen showed that the bullet passed upward and outward from the orifice of entrance at the inner side of the knee, but without opening the joint cavity, and impinged against the femur about three and a half inches above the extremity of the condyles, fracturing the bone very obliquely with comminution, so obliquely, indeed, that while the line of fracture commences about three and a half inches above the extremity of the condyles, as already stated, it terminates about seven inches above the extremities of the femoral condyles, so that the lower fragment of the broken femur is, in all, about seven inches long. The fragments of comminution had all united with more or less irregularity of position, but portions of some of them appeared likely to exfoliate. The two principal fragments had united at something of an angle opening forward and a little inward, so that the femur bowed backward and somewhat outward on that account. The marrow at the place of examination, a few inches above the fracture, was bright red in color, and presented a striking resemblance to newly formed granulations. A few spots appeared to be undergoing the process of conversion into bone." The pathological preparation, *Specimen* 2167, was contributed to the Army Medical Museum by Dr. Lidell. A colored drawing of the specimen, prepared by Hospital Steward E. Stauch, U. S. A., is copied in the chromo-lithograph (PLATE XXIV) opposite.

Shot Fractures of the Lower Third of the Femur treated by Conservation.—Six hundred and twenty cases of shot fractures of the lower third of the femur were treated without operative interference. Instances of shot fracture of the lower third of the femur, in which the knee joint was primarily involved, are not included in this series; they will be considered in Section IV of this Chapter, with injuries of the knee joint. Three hundred and seventy-five of the six hundred and twenty patients recovered; two hundred and thirty-two died, and in thirteen instances the result remained undetermined, giving a ratio of mortality of 38.2 per cent. Five hundred and two were Union, and one hundred and eighteen were Confederate soldiers, and the proportion of deaths among the former was 38.7, among the latter 36.0 per cent.

Successful Cases of Shot Fractures of the Lower Third of the Femur treated by Conservation.—Three hundred and four of the three hundred and seventy-five survivers of shot fracture of the femur in the lower third were Union soldiers, and an account of the pension record has been obtained in two hundred and thirty-nine instances:

FIG. 157.—Result of shot fracture of lower third of right femur. [From a photograph.]

CASE 397.—Private C. H. Schellenger, Co. C, 9th New York Heavy Artillery, aged 35 years, was wounded at Petersburg, April 2, 1865, and admitted to the field hospital of the 2d division, Sixth Corps, where Surgeon W. A. Childs, 10th Vermont, recorded: "Shot fracture of right femur; splints applied." Surgeon E. Griswold, U. S. V., reported the patient's entrance into Judiciary Square Hospital April 12th, and the fracture as being located at the "middle third" of the bone. He also stated that the treatment at first consisted of simple dressings, and afterwards splints and sand bags were used, and that "the progress of the case was favorable throughout, the wound being nearly healed about the middle of June, with one and a half inches shortening of the limb." The patient was discharged from service June 22, 1865, and pensioned. Examiner E. Hall, of Auburn, New York, certified, November 25, 1865, to "shot wound through right thigh above the knee, breaking the femur obliquely, the ball coming out on the inside of the leg near the scrotum. Limb shortened and knee quite stiff from thickened cartilage." The Syracuse Examining Board reported, April 5, 1876: * * * "The limb, he alleges, is lame, weak, and subject to spasms upon fatigue." The pensioner was paid June 4, 1879. His photograph, taken at the Army Medical Museum in June, 1865 (*Surg. Phot. Series*, A. M. M., No. 45), is represented in the wood-cut (FIG. 157).

In the following instance the patient recovered with such excellent use of the limb that the Pension Examining Board recommended, in 1876, that the pensioner's name be dropped from the Rolls, as the disability had ceased and the injured limb was as well nourished as the other:

CASE 398.—Private J. Durst, Co. D, 69th New York, aged 21 years, was wounded at Hatcher's Run, March 25, 1865. On the following day he was admitted to the Depot Hospital of the Second Corps, at City Point, and, on March 30th, he reached Washington, where he entered Armory Square Hospital. Acting Assistant Surgeon G. K. Smith contributed the following history: "A minié ball entered the anterior aspect of the right thigh at the junction of the middle and lower thirds, passing backward and fracturing the femur, and made its exit opposite the wound of entrance. The injury produced very little constitutional disturbance, and the discharge from the wound did not exceed two drachms in twenty-four hours at any time. The limb was treated in Hodgen's splint, without extension, until April 14th, when it was placed on a mattress with a sand bag

PLATE XXIV. OSTEOMYELITIS IN A FRACTURED FEMUR

Case of Pvt. Tobias Beaver, Co. "C" 96th Ohio Infantry.

on each side to keep it in position, and extension was applied by Buck's method. On June 9th the extension was removed and the bone was found to be firmly united, with one and one-fourth inches shortening. The patient was now walking on crutches. The anterior wound had healed for about a week, but the posterior wound was still discharging very slightly. By June 23d he had good movement of the knee and could bend the leg to a right angle with the direction of the thigh. The discharge from the wound at this time did not amount to over one drachm in a week. No fragments of bone were ever removed, and the limb healed almost as kindly as a simple fracture, showing no deformity except the shortening." The patient was subsequently transferred to DeCamp Hospital, David's Island, New York, and, on August 19, 1865, he was discharged and pensioned. Examiner W. M. Chamberlain, on August 22, 1866, certified to a "well united fracture of the right femur, with only one inch shortening, and some lameness and debility of the limb." Substantially the same was reported at subsequent examinations until January 19, 1876, when the New York Board certified to the injured thigh being as well nourished as the other, and to the disability as having ceased, in accordance with which the pensioner was dropped from the Pension Rolls. A photograph of the patient, taken at the Army Medical Museum in June, 1865 (*Surg. Phot. Series*, No. 46, A. M. M.), is represented in PLATE LXIII, opp. p. 196.

CASE 399.—Private E. P. Allen, Co. D, 12th Infantry, aged 19 years, was wounded at Gettysburg, July 2, 1863, and admitted to the field hospital of the 2d division, Fifth Corps. The injury was caused by a minié ball, which lodged in the anterior portion of the lower third of the left thigh, and was removed on the following day by Assistant Surgeon E. DeW. Brenneman, U. S. A. The missile was contributed to the Museum by the operator and is represented in the annexed wood-cut (FIG. 158). It consists of a conoidal ball beaten into nearly a triangular pyramid with very sharp edges. From the field hospital the patient was, on July 25th, transferred to the Cotton Factory Hospital at Harrisburg, whence Acting Assistant Surgeon W. S. Woods reported that he was discharged from service December 21, 1863, by reason of "compound fracture of left thigh." Examiner C. Hard, of Ottawa, Illinois, certified, May 1, 1869: "There is a compound comminuted fracture of the lower third of the left femur. The bones have united, with three inches shortening, leaving great and incurable deformity, and there is partial anchylosis of the knee joint, making him permanently lame." In September, 1873, the same Examiner stated that "the heel is drawn up, the foot turned out, and the limb atrophied from foot to body." The pensioner was paid June 4, 1879.

FIG. 158.—Battered conoidal ball removed from thigh. *Spec.* 3028.

CASE 400.—Private M. Burns, Co. B, 28th Massachusetts, aged 22 years, was wounded at Hatcher's Run, March 25, 1865. Surgeon F. M. Hammond, 126th New York, noted his entrance into the field hospital of the 1st division, Second Corps, with "shot wound of left thigh." The wounded man reached Washington April 3d, and was admitted to the Armory Square Hospital, whence Acting Assistant Surgeon G. K. Smith reported the following history: "The missile, a minié ball, entered the anterior portion of the thigh at the junction of the middle and lower thirds, and, passing horizontally backward, fractured the femur and made its exit posteriorly. The constitutional disturbance resulting from the injury was very slight, the discharge of pus from the wound amounting to only about half an ounce in twenty-four hours. The limb was shortened two inches. It was placed on a mattrass, between two sand bags, and extension was applied with a sixteen pound weight. Muriated tincture of iron was ordered; but no stimulants were given. By April 15th, the discharge amounted to only one drachm daily, and the limb was shortened only one and a quarter inches. On May 11th, believing the fragments to be firmly united, I allowed the extension to be removed and the patient to ride on the invalid chair, and, on measuring the limb, I found that it was still shortened three-quarters of an inch. I reapplied the weight; but this contraction could not be overcome by any amount of extension that the patient could bear. He was now kept in bed until June 9th, at which time the fragments had firmly united and he commenced walking on crutches. No fragments of bone were ever removed from the limb." The patient was transferred to the Readville Hospital July 5th, and subsequently to Dale Hospital, Worcester, where he was discharged and pensioned August 28, 1865, Surgeon C. N. Chamberlain, U. S. V., certifying to "fracture of femur, with moderate deformity and shortening and slight contraction of the flexors of the thigh." The pensioner enlisted in the 43d Infantry on August 21, 1867, and was again discharged June 10, 1869. Examiner I. F. Galloupe, of Lynn, Massachusetts, certified, in 1869: "A musket ball passed through the left thigh, fracturing the femur. The wound is healed and the bone appears to be sound. The limb is shortened and he walks slow and with difficulty," etc. In June, 1874, the same Examiner reported: "In walking he does not touch the heel, but rests on the forward part of the foot, thus making locomotion slow and fatiguing. The limb is painful when much used and in cold weather. The femur is enlarged and the foot is swollen." The pensioner was paid June 4, 1879. FIG. 2 of PLATE LXIII, opp. p. 196, represents a copy of a photograph of the patient taken at the Army Medical Museum on June 25, 1865 (*Surg. Phot. Series*, No. 47, A. M. M.).

CASE 401.—Corporal L. Tenney, Co. F, 82d New York, aged 20 years, received a comminuted fracture of the lower third of the right femur, at Gettysburg, July 2, 1863. The following history of the case and its result was obtained from reports of Surgeon Z. E. Bliss, U. S. V., in charge of Camden Street Hospital, Baltimore, and Assistant Surgeon W. Webster, U. S. A., in charge of DeCamp Hospital, David's Island, New York Harbor: "The ball, believed to be cylindro-conoidal, struck the anterior surface of the bone external to the median line, and passed directly backward through the posterior surface of the thigh. The patient stated that the limb bent beneath him, at the point of the fracture, directly the injury was received. Soon afterwards he was borne from the field on a blanket, and was deposited temporarily in a neighboring barn. The following day he was removed in an ambulance about the distance of a mile to a temporary hospital. There he first received professional attendance, and was placed under the influence of chloroform preparatory to amputation of the thigh. The examination, however, to which he was submitted, appears to have decided the attending surgeon in favor of endeavors to preserve the limb. A rough fracture-box was accordingly adopted, in which the limb remained subjected to cold-water dressings for six days, when the disclosure to the surgeon of three inches contraction of the femur induced him to substitute a double-inclined plane. The patient alleged that by this new apparatus the limb was restored to its normal length. About three weeks after the reception of the injury the double-inclined plane gave place to Smith's wire splint, which was employed during a space of five weeks. In the mean time the patient was transferred to the Corps Hospital at Gettysburg, where he remained until October 21st. The fracture appears to have been

thought sufficiently consolidated on August 20th to warrant the removal of all mechanical support from the limb on that date. Tenney stated that the limb was at that time of primitive length, and that he could raise the heel from the bed by the unaided muscular power of the leg. The posterior aperture gave constant exit to pus of a healthy character throughout the treatment. The perpendicular direction of the wound, in the recumbent posture of the patient, is believed to have had a beneficial influence in this instance, as it has in several other successful cases whose treatment has come under observation, in protecting the patient from accumulations of pus and securing an otherwise happy result. It will be observed that the fracture of the femur suffered by this patient was one of those typically favorable cases described by Stromeyer, where the femur is struck by the bullet on the outer side, remote from the great vessels, and the limb traversed in an antero-posterior direction, affording free escape to the secretion of the wound during treatment. About the middle of October the patient was able to move about on crutches, and on the 20th of that month he was removed from Gettysburg to Baltimore. On January 1, 1864, he walked a distance of three miles without the aid of cane or crutch. One week afterwards an exploration of the wounds discovered small necrosed portions of the shaft, which were removed by Surgeon Bliss, under chloroform, by making an incision two and a half inches in length anteriorly, and another internally three and a half inches long. On April 26th the patient was transferred to DeCamp Hospital, at which time he was able to walk about freely without cane or crutch. The osseous case of new bone which surrounded the fracture was very large, and an operation performed by Acting Assistant Surgeon E. DeWitt, on February 18, 1864, for the further removal of necrosed bone, necessitated the penetration of the involucrum by the trephine to a depth of two inches and a half. Nine spiculæ of old bone were removed during the operation, the largest of which was one inch long, a half inch wide, and one-fourth of an inch in thickness. About three weeks afterwards a thin fragment of sequestrum, two inches long and a half inch wide, was removed by the same channel. The patient received his discharge from service October 1, 1864, after which he was employed for nearly two years, in the capacity of a wardmaster, at DeCamp Hospital. At the date of the report, March 5, 1866, he was one of the most accomplished and indefatigable skaters at the hospital, and suffered no inconvenience from the injured limb, although the two wounds had not yet permanently cicatrized." Examining Surgeon T. F. Smith, of New York City, September 17, 1873, certified to the injury, and stated: "There are eight adherent cicatrices, with great loss of bone and muscular substance; movements of knee joint limited one-half," etc. The New York City Examining Board, two years later, reported that "the bone united with great thickening," etc.; also that "the cicatrices on the anterior, outer, and posterior surfaces of the limb are attached to the bone and at times take on ulceration." Substantially the same was reported at an examination in September, 1878. The pensioner was paid June 4, 1879.

CASE 402.—Private R. Hanlon, Co. C, 5th Cavalry, aged 21 years, was wounded at Beverly Ford, June 9, 1863. On the following day he was admitted to Lincoln Hospital, Washington, subsequently to Judiciary Square, and lastly to Carlisle Barracks, whence he was discharged May 16, 1864, and pensioned. Acting Assistant Surgeon G. K. Smith contributed the following history: "He was wounded by a minié ball, which entered the external aspect of the left thigh near its middle, comminuting the greater portion of the middle third of the femur, and splitting the lower third longitudinally nearly down to the knee joint. The missile lodged and could not be found. Ether was administered and the wound enlarged, and seventeen fragments of bone, comprising three inches of the continuity of the shaft, were removed. On June 23d, an abscess opened on the inner aspect of the thigh, near the perinæum, through which the ball was extracted. The limb was bandaged in its whole length, placed on a mattrass, and kept in position by a sand bag on either side. Owing to the loss of bone no extension was resorted to until October 1st, at which time the patient was able to roll his injured limb on the mattrass, the fragments having united, though the callus had not yet become firm and hard. I then applied a ten pound weight, suspended by a cord and pulley, and succeeded in reducing the shortening one-half inch. This amount of extension was continued until I left Lincoln Hospital, on November 8th, but was removed soon afterwards. On December 16th, while moving about on crutches, the patient fell and refractured the bone. The surgeon in charge then applied a long splint to the posterior aspect of the limb, retaining it in that position and preventing any motion of the knee joint until the fragments had reunited. The wound healed in the beginning of March, 1864, but broke open again in the middle of June, and continued to discharge slightly until March, 1865, during which time, however, the man was able to walk about and to serve as a watchman at the Government Repair Shops in Washington. On June 20th, 1865, the limb appeared perfectly sound, and at this period the man could walk all day without feeling tired, though there was fibrous anchylosis of the knee joint." Various pension examiners have certified at different dates to "anchylosis of the knee and about three inches shortening of the limb." The pensioner was paid June 4, 1879. PLATE LXIV, FIG. 1, opp. p. 198, represents his photograph, taken at the Army Medical Museum in June, 1865.—(*Surg. Phot. Series*, No. 55, A. M. M.)

CASE 403.—Private J. O'Conner, Co. F, 16th Michigan, aged 16 years, was wounded at Cold Harbor, June 2, 1864. He reached the Fifth Corps Hospital at White House three days after the injury, and was thence conveyed to Washington, where he entered the Armory Square Hospital June 10th. Acting Assistant Surgeon G. K. Smith made the following report of the case: "A minié ball entered the external aspect of the left thigh three inches above the patella, and, passing obliquely inward and upward, fractured the shaft of the femur through the upper end of the lower third, making its exit posteriorly. The patient was treated by Acting Assistant Surgeon T. O. Banister. Hodgen's splint was used, and no extension was applied other than the tying of the foot to the foot-board with a bandage. During the treatment eight small fragments of bone were removed. On December 27th the patient, though his wound had not entirely healed, was transferred to the Veteran Reserve Corps and placed on guard duty; but being unable to perform it, he was readmitted to the hospital for treatment several weeks afterwards. He came under my care on June 22, 1865, at which time he was in good health, but slightly lame and able to walk without a cane. There was still a slight discharge of sero-purulent fluid from the wound. The limb was shortened one and one-fourth inches, and, at the seat of the fracture, it was a little larger than normal but not otherwise deformed. On July 18, 1865, the patient was mustered out of service, with his wound still open." Examiner W. G. Wilkinson, of Farwell, Michigan, May 16, 1876, certified to the wound, and stated: "The fracture has been followed by necrosis of bone, several pieces having been removed during the year 1875. The sciatic nerve was injured, and the veins are in a varicose condition. The wound has continued open." The pensioner was paid June 4, 1879. His photograph, taken at the Army Medical Museum in June, 1865 (*Surg. Phot. Series*, No. 49, A. M. M.), is copied in PLATE LXIV, FIG. 2, opp. p. 198.

PLATE LXIII. — CONSOLIDATED GUNSHOT FRACTURES OF THE FEMUR

Fig 1. Case of Private J. Durst
69 th New York.

Fig 2. Case of Private M. Burns
28 th Massachusetts

The records of the Pension Office show that, of the three hundred and four Union soldiers who recovered after shot fracture of the lower third of the femur under conservative treatment, twenty-five have died since the termination of the War. In the following instance the patient survived the injury fourteen and a half years:

CASE 404.—Assistant Surgeon T. S. Stanway, 102d Illinois, aged 33 years, was wounded during a fight with Guerrillas, between Lavergne and Nashville, December 21, 1863, a pistol ball entering the left thigh about four inches above the knee joint, passing downward and out about two inches above the knee, fracturing the femur in two places. The limb was treated with simple dressings and kept upon a double-inclined plane. About two weeks after the injury an abscess formed, which was evacuated through the lower wound. The wound healed rapidly, without loss of bone, and union took place between the fractured ends. About two months after the reception of the wound the patient obtained a leave of absence and went to his home, and on April 29, 1864, he returned to his regiment with a good limb of proper length. Soon afterwards he started with his command on the Atlanta campaign. In the course of six weeks, however,—owing to the want of sufficient nutrition,—scurvy set in, and the newly formed callus was gradually absorbed. Although keeping the limb supported by starch bandages, he became almost unable to step upon it, in consequence of which he resigned August 13, 1864. Some months after reaching his home partial union again took place, but the limb remained shortened to the extent of three inches. Dr. Stanway became a pensioner, and was examined on April 17, 1865, by Examiner J. A. Young, of Monmouth, Illinois, who described his condition as follows: "There is displacement of the upper portion of the femur downward and outward, with consequent shortening of nearly two inches. At present he suffers from pain, particularly during locomotion, owing to the slipping of the tendon of the vastus externus over the projecting end of the femur." The San Francisco Examining Board, in September, 1873, reported "an apparent movement in the bone at the point of the fracture," and several years later, "slight overlapping of the extremities, occasioning deformity, also lameness," etc., was alleged. The pensioner died at Los Angelos, California, prior to May, 1878.

Fatal Instances of Shot Fracture of the Lower Third of the Femur treated by Conservation.—Two hundred and thirty-two such cases are reported:

CASE 405.—Sergeant Sewell T. Douglas, Co. G, 1st Maine Heavy Artillery, aged 28 years, was wounded at the battle of Spottsylvania, May 19, 1864, and was admitted to Emory Hospital, at Washington, May 22, 1864. A musket ball entering posteriorly, had fractured the lower third of the left femur and lodged in the medullary cavity. The injured limb was placed on a double-inclined plane and moderate extension was used. Internally, stimulants and tonics were employed. In August, 1864, the patient suffered from severe diarrhœa. There was a copious ill-conditioned discharge from the wound. The patient died September 26, 1864, from exhaustion, and, at the autopsy, a deposition of callus was found at the seat of injury, enclosing several necrosed splinters and a battered musket-ball. The specimen (FIG. 159) was contributed to the Army Medical Museum by Acting Assistant Surgeon J. M. Downs.

FIG. 159.—Partially consolidated gunshot fracture of left femur. *Spec.* 3267.

CASE 406.—Private E. A. Dickerson, Co. C, 5th New Hampshire, was wounded in the right thigh, at Fair Oaks, June 1, 1862, and was admitted to the Fifth and Buttonwood Streets Hospital, Philadelphia, ten days afterwards. Acting Assistant Surgeon A. C. Bournonville reported the nature of the injury and its result as follows: "A compound comminuted fracture of the femur at the junction of the middle and lower thirds. At date of admission the wound was suppurating freely, with no effort at repair, though the patient was doing well. The treatment was by weights and sand bags. Death occurred on September 5, 1862." The specimen represented in the cut (FIG. 160) consists of a portion of the femur, obliquely fractured in the lower third, showing considerable but irregular effusion of callus without union, and the formation of a sequestrum in the upper fragment. It was contributed by Acting Assistant Surgeon W. Hunt.

FIG. 160.—Oblique fracture of lower third of right femur. *Spec.* 240.

CASE 407.—Private *O. Hales*, Co. F, 61st Georgia, aged 34 years, was wounded at Monocacy, July 9, 1864, and entered the General Hospital, at Frederick, three days afterwards. Acting Assistant Surgeon T. E. Mitchell contributed the pathological specimen (*Cat. Surg. Sect.*, 1866, p. 468, *Spec.* 3934) and the following history: "The patient was admitted into this hospital with gunshot fracture of the left femur, lower third. He came under my care on August 29th, Smith's anterior splints having been applied to the injured limb. He complained very much of pain in his leg, which was swollen and discharging freely from the wound. His appetite was good, but his appearance was quite anæmic. I prescribed tincture of iron and quinine, with milk punch three times a day. On September 10th, I removed the splint and substituted Buck's apparatus with sand bags to the outside of the leg. Under this treatment his condition remained much the same as when I first saw him. By October 1st, suppuration was still continuous, and the patient was very much reduced in strength. On November 1st, his appetite was better and his general condition slightly improved, though as yet there was no union of bones. On November 12th, I made counter-openings into the thigh and found sinuses extending nearly to the hip. On November 19th hæmorrhage, amounting to about four pints, took place from the femoral artery, from the effects of which he died. The *post-mortem* examination proved that non-union of the bones was due to a small spicula of loose bone between the broken ends of the femur. The hæmorrhage was the result of sloughing of the femoral artery, which, in all probability, was wounded in making the counter-opening." The specimen consists of a wet preparation of portion of the femoral and popliteal arteries, injected with wax, and shows the accidental wound of the vessel, enlarged by ulceration, from which the secondary hæmorrhage occurred.

Shot Fractures of the Femur without Indication of the Seat of Injury treated by Conservation.—Besides the shot fractures in the upper, middle, and lower thirds of the femur treated by conservation, considered in the preceding pages, there were seven hundred and thirty-eight cases in which the precise seat of injury was not indicated. In fifty-five of these cases the result as to fatality is undetermined. Of the six hundred and eighty-three determined cases, five hundred and thirty-eight died principally in the field hospitals a few days after the reception of the injury, giving the large death rate of 78.7 per cent. The histories of these cases are brief, and give little information beyond the mere fact that the femur had been fractured; it is, therefore, not considered necessary to detail examples of this group. In two hundred and eighty-three cases the right femur was involved; in two hundred and eighty-two, the left; and in one hundred and seventy-three the side was not specified. Six hundred and two of the patients were Union and one hundred and thirty-six were Confederate soldiers.

Pseudarthrosis after shot fractures of the femur was not frequent. Sixteen instances are reported among the three thousand four hundred and sixty-seven shot fractures of the femur treated by expectant measures. In seven cases the fracture was in the upper third, in three in the middle third, and in six in the lower third. Two examples[1] will be cited:

CASE 408.—Corporal E. G. Abbott, 4th Indiana Battery, aged 21 years, was wounded at Stone River, December 31, 1862. He remained at a field hospital of the Fourteenth Corps for nine days, when he was conveyed to Murfreesboro'. Two months later he was transferred to hospital at Nashville, and subsequently to Louisville, at all of which places his injury was recorded as a "shot wound of left thigh." On April 14, 1863, the patient was discharged from Camp Chase, Acting Assistant Surgeon J. S. Bailey certifying to "Shot fracture of left femur, resulting in nearly two inches shortening." In January, 1871, Dr. A. L. Lowell, Special Examiner of the Pension Office, who saw the man several years previously, furnished the following description of the injury and its result, which he obtained partly from his own observations and partly from a personal communication of Examiner L. T. Ballou, of Newark, Ohio: "A conoidal ball struck the left thigh anteriorly, about four inches below the great trochanter, and, fracturing the femur, passed backward and made its exit about one inch below the gluteal fold. He states that neither splints nor extension were ever applied to the limb. About September 1, 1863, the external wound had healed, but there was still some tenderness about the seat of the fracture, and as he further improved and began to use the limb with less care, he observed that it would rotate. At present he is able to shorten the distance between the knee and trochanter six inches by a sudden swinging and extending motion of the limb, which appears to throw the lower fragment to one side and is followed by voluntary contraction of the muscles. While in this position he is able to support his weight (140 pounds) on the limb, and he can then extend the same again to its former position by a little shaking, or, as he describes it, by a 'wiggle,' the thigh in either attitude being firm and inflexible. He can evert the left foot so as to place its heel to the toes of the right foot, thus placing the outer margin of the left foot in apposition with the inner margin of its fellow. These malpositions are completed without eversion of the trochanter. The lower part of the shaft of the femur appears to slide up on the anterior and internal surface of the upper fragment. The upper and middle thirds of the injured thigh exceed the corresponding portions of its fellow one inch in circumference. This increased size is doubtless due to a large ensheathing callus which surrounds the lower portion of the upper third of the femur, and which is distinctly perceptible by digital compression. Sometimes, though only with great care, the man is able to walk well, his gait showing only a slight irregularity of step. The limb is often pain-

[1] The remaining 14 instances of pseudarthrosis in the femur after fracture treated by conservation are: 1. Pt. J. Kissee, 1st Arkansas Cavalry, aged 29; fracture of upper third of right femur; Arkansas River, May 16, 1864; discharged March 20, 1865; recovery, with 1½ inches shortening and a false joint.—2. Pt. Joseph Patterson, G, 40th Indiana, aged 20; shell fracture of upper third of left femur; Stone River, Tennessee, December 31, 1862; discharged April 21, 1863; there is 3 inches shortening, and the ligamentous union or false joint renders locomotion uncertain.—3. Pt. Franklin Rosenbery, A, 148th Pennsylvania, aged 36; shot fracture of upper third of right femur; Spottsylvania, May 12, 1864; discharged May 15, 1865; 1 inch shortening: there is cartilaginous union—the limb can be rotated on the thigh, and the foot is entirely reversed.—4. Pt. H. Meyers, B, 157th New York, aged 30; shot fracture of upper third of left femur; Gettysburg, July 1, 1863; discharged December 3, 1863; shortening about 2½ inches, with false joint at point of fracture.—5. Lieut. B. Button, B, 76th New York, aged 46; shot fracture of upper third of left femur; Gettysburg, July 1, 1863; discharged November 9, 1863; nearly 3 inches shortening and false joint.—6. Corp'l Franklin Cusick, H, 108th New York, aged 21; shot fracture of upper third of right femur; Wilderness, May 5, 1864; discharged March 31, 1865; shortening of 1½ inches, leaving a false joint with eversion of toes.—7. Pt. J. F. Hutchinson, B, 7th Maine, aged 24; shot fracture of right femur at middle third; Wilderness, May 5, 1864; discharged July 7, 1865; false joint and 2 inches shortening.—8. Pt. P. S. Chase, I, 2d Vermont, aged 20; shot fracture left thigh, middle third; Wilderness, May 5, 1864; discharged May 16, 1865; false joint and shortening of the thigh 2 inches.—9. Pt. J. L. Hanna, D, 95th Pennsylvania, aged 42; compound fracture of left femur at middle; West Point, Virginia, May 10, 1862; discharged August 29, 1862; false joint at point of fracture, and 3½ inches shortening; muscles atrophied.—10. Pt. L. Paul, C, 12th Wisconsin, aged 24; shot fracture of lower third of femur; Kenesaw Mountain, June 15, 1864; discharged September 1, 1865; false joint and 2 inches shortening; varicose veins covering all the leg and lower thigh.—11. Pt. L. D. Boyd, K, 85th Pennsylvania, aged 24; shot fracture left thigh just above the condyles; Ware Bottom Church, May 20, 1864; discharged November 22, 1864; artificial joint and about 3 inches shortening.—12. Corp'l E. H. Morrison, F, 35th Illinois, aged 20; shot fracture right thigh about 2½ inches above knee joint; Chickamauga, September 19, 1863; discharged January 19, 1864; false joint and about 2½ inches shortening.—13. Pt. H. P. Mayer, A, 1st West Virginia, aged 22; shot fracture left femur, lower third; New Market, May 15, 1864; discharged October 10, 1864; weak cartilaginous union; can bring the bottom of his foot against his face.—14. Pt. B. Whiting, C, 9th New York Heavy Artillery, aged 27; shot fracture right femur about 4 inches above knee; Cold Harbor, June 3, 1864; false joint above knee; limb shortened about three inches.

ful, and frequently he is obliged to suspend his occupation as a laborer. During the winter of 1869 he could not walk without pain, and was unable to put on his boot." Subsequent examiners report no changes in the condition of the limb. The pensioner was paid June 4, 1877.

CASE 409.—Private E. Gilroy, Co. F, 6th Vermont, aged 22 years, was wounded and captured at Savage Station, June 29, 1862. After remaining in the hands of the enemy for one month, he was exchanged and conveyed to Philadelphia. Acting Assistant Surgeon J. Neill, in charge of Broad and Cherry Streets Hospital, reported the following description of the injury: "A musket ball entered the right thigh anteriorly, three inches above the knee joint, passed backward and fractured the femur, and was removed by a surgeon on the field. The wounded man was admitted to this hospital on July 30th, at which time there was considerable swelling and inflammation of the thigh, also slight sloughing of the edges of the wound, which discharged healthy pus. The foot was everted and there was two inches shortening of the limb. The patient's health was good. A stimulating poultice was applied to the part and the limb kept in a Dessault apparatus, with side-extension and counter-extension, for six weeks. At the end of this time the wounds had healed, but there was very little, if any, union at the seat of the fracture. Two moulded splints of binder's board, with bandage, were then applied to the thigh, and Dessault's apparatus continued." Subsequently, on November 18th, "union of bone, with one inch shortening and fair indication of a good cure," was noted in the case; but at the date of the patient's discharge from service, February 23, 1863, the fracture was reported as remaining ununited. Examiner T. B. Nichols, of Plattsburgh, New York, reported April 15, 1858: "The leg is five inches shorter than its fellow and swings loosely, except when he lets his weight down upon it. In this position it supports him, but in no other is it of any use." In September, 1873, the same examiner described the injured limb as being shortened six inches, and stated that the man "can lift his right foot with his hand up against his breast." The pensioner was paid June 4, 1879.

Comments on the various complications of shot fractures of the femur treated by conservation—pyæmia, tetanus, gangrene, erysipelas, and hæmorrhage—and on the different modes of treatment, will be reserved for the concluding pages of this section of Chapter X.

EXCISIONS IN THE CONTINUITY OF THE FEMUR FOR SHOT INJURY.

The results of excisions in the continuity of the femur performed during the American civil war have been discouraging, and justify the disfavor with which this operation is regarded among American[1] as well as European[2] surgeons. One hundred and seventy-five cases have been reported.[3] In eight instances the terminations could not be ascertained.

[1] HAMILTON (F. H.) (*A Treatise on Military Surgery and Hygiene*, New York, 1865, p. 517) remarks that he has never seen a case of shot fracture of the femur that would justify excision. "The great depth of the bone and the attachment of the muscles to almost every point of the surface of the bone are, perhaps, the chief circumstances which render these operations so unsuccessful." GROSS (S. W.) (*Military Surgery*, in *Am. Jour. Med. Sci.*, 1867, Vol. LIV, p. 478): "Resection of the femur in its continuity has proved to be a more fatal procedure than amputation at the hip, and should, therefore, not be repeated." ASHHURST (JOHN, jr.,) (*The Principles and Practice of Surgery*, Philadelphia, 1878, p. 167) asserts that "excision in the continuity of the femur is a bad operation and should be definitely rejected from military practice."

[2] SCHWARTZ (H.) (*Beiträge zur Lehre von den Schusswunden, etc.*, Schleswig, 1854, p. 166): "The resection of the splintered ends of the fracture for the purpose of converting the comminuted fracture into a simple fracture, as well as any resection in the continuity, is to be rejected in the femur." DEMME (H.) (*Militär-Chirurgische Studien, etc.*, Würzburg, 1861, B. II, p. 285): "The facts hitherto known justify the total rejection of resection in the continuity of the femur, even more so than the resection in the shaft of the humerus." NEUDÖRFER (J.) (*Handbuch der Kriegschirurgie, etc.*, Leipzig, 1872, B. II, Zweite Hälfte, p. 1521): "Even as an advocate of resection in the continuity of bone, one cannot defend resection in the continuity of the femur, as, in this bone, the indication for the resection is relatively rarely found, and as the risks attending its execution are very great. It is possible that a resection in the continuity for total caries of the injured bone at the point of fracture may prove successful; but, as yet, no such cases have been observed. It is also probable that, even in the most favorable case of recovery after resection for caries, the resected ends of bone would not unite, and that pseudarthrosis would be the result of the resection."

[3] Instances of excision in the shaft of the femur for shot fracture are not frequent in military surgery: 1. ROSS (G.) (*Militairärztliches aus dem Ersten Schleswigschen Feldzuge im Sommer*, 1848, Altona, 1850, p. 54) excised 1½ inches of the shaft of the left femur in a Prussian soldier, wounded at Düppel, June 5, 1848; death from gangrene.—2. SCHWARTZ (H.) (*Beiträge zur Lehre von den Schusswunden*, Schleswig, 1854, p. 167) relates the case of a Danish volunteer, wounded at Kolding, April 23, 1849; fracture at junction of upper and middle thirds of the right femur; excision April 26; death April 28, 1849.—3. STROMEYER (L.) (*Maximen, etc.*, Hannover, 1855, p. 757) tabulates a third fatal instance of excision in the shaft of the femur from the Schleswig-Holstein War, 1848-50.—4-14. CHENU (J. C.) (*Stat. Med. Chir. de la Camp. d'Italie en* 1859 *et* 1860, Paris, 1869, T. II, p. 763) tabulates 6 cases of excisions in the shaft of the femur, with 5 deaths, and, on page 762, gives an extract from a report of Dr. BIMA, of the Sardinian army, who states that of 5 excisions in the shaft of the femur by the subperiosteal method, performed at the hospital at Vercelli, 4 proved fatal: A. Paschit, Regiment Archduke Leopold, admitted into hospital May 31, 1859; shot comminution of femur; excision June 5, after extraction of missile; sent to Verona, Aug. 4, 1859; able to walk with the aid of a cane. E. Rigovich, Regiment Archduke Leopold, admitted into hospital May 31, 1859; shot comminution of lower third of femur; excision June 18; death September 13, 1859. E. Opodopic, Regiment Archduke Leopold, admitted May 31, 1859; comminuted fracture lower third of femur; excision of three centimeters of bone June 22; death July 6, 1859. L. Gerbitz, Austrian, admitted into hospital May 31, 1859; comminuted fracture lower third of femur; excision June 23; death July 23, 1859. M. Geldschmitt, Regiment Wimpfen, admitted May 31; comminuted fracture middle third of femur; excision June 4; death July 17, 1859.—15-16. HEINE (B.) (*Die Schussverletzungen der Unteren Extremitäten*, Berlin, 1866, p. 293) reports that in the Schleswig-Holstein War of 1864, excision in the shaft of the femur was only performed twice by Dr. NEUDÖRFER; the result is not indicated.—17. LOTZBECK (*Zur Resection des Trochanter major*, in *Aerztliches Intelligenz Blatt*, München, 1870, B. XVII, p. 438) cites the case of Sergeant W. S——, 9th Infantry; fracture of left trochanter major, July 4, 1866; excision of trochanter in September; death November 9, 1866.—18-21. BECK (B.) (*Chirurgie der Schussverletzungen Freiburg*, 1872, p. 912) tabulates 4 cases of excision of the shaft of the femur in the Austro-Prussian War of 1866; only one patient survived.—22-37. CHENU (J. C.) (*Aperçu Hist. Stat. et Clin., etc., pendant la guerre de* 1870-71, Paris, 1874, p. 493) tabulates 16 cases of excision of the shaft of the femur, with 14 deaths, from the Franco-Prussian War, 1870-71; four cases reported by FELTZ and GROLLEMUND, and two by ROALDES, seem not to be included in M. CHENU'S *Statistics*.—38-41. FELTZ et GROLLEMUND (*Relation Chir. sur les Ambulances de Haguenau*, in *Gaz. Méd. de Strasbourg*, 1871, No. 11, pp. 131-134) relate 4 cases: J. Debat, 47th Line, aged 22, fracture of upper third of left femur, in August, 1870; secondary excision September 26; death October 2, 1870. Beschia Mohammed, 3d Tirailleurs; fracture of middle third of right femur; excision September 26; death October 2, 1870. Thomas Ferray, aged 20, 1st Algerian Tirailleurs; shot fracture of middle third of femur, prior to August 8, 1870; excision August 28; recovery. E. Plichon, 3d Zouaves, aged 22; fracture of middle third of right femur, prior to August 9, 1870;

Fifty-one cases had a successful, and one hundred and sixteen a fatal issue, giving a mortality of 69.4 per cent.

Primary Excisions in the Shaft of the Femur.—Ninety-one, or more than one-half of the total number of cases of excision in the shaft of the femur, belong to the primary group. In six instances the result remains undetermined; twenty proved successful, and sixty-five were fatal, giving a mortality rate of 76.4 per cent.

Cases of Recovery after Primary Excision in the Shaft of the Femur.—Of the twenty patients who survived this operation, four were Confederate and sixteen were Union soldiers. The point of excision was in the upper third in twelve instances, in the upper and middle thirds in one, in the middle third in five, in the middle and lower thirds in one, and in one instance the point of excision was not indicated. Thirteen of the sixteen Union soldiers were pensioned and were living in 1879. In the following case four inches of the upper and middle thirds of the shaft of the femur were excised:[1]

FIG. 161.—4¾ inches of right femur excised for oblique fracture. *Spec.*2159.

CASE 410.—Lieutenant W. M. Tirtlot, Co. F, 105th Illinois, aged 24 years, was wounded at Resaca, May 15, 1864, by a shell, which fractured the right femur. He was admitted to the field hospital of the 3d division, Twentieth Corps, where excision was performed but not recorded. On June 22d he was transferred to hospital No. 2, Chattanooga, and several days afterwards to the Officers' Hospital at Nashville. Surgeon J. E. Herbst, U. S. V., in charge of the latter, reported: "Shot fracture of femur, middle third. Primary excision of about four inches of the shaft at the middle third was performed on the field by Surgeon A. W. Reagan, 70th Indiana. The limb was treated in straight splints, and simple dressings were applied. Tonics and a generous diet were prescribed." The patient went on leave of absence July 21st, and on November 28, 1864, he was mustered out and pensioned. The excised portion of the femur was contributed by Surgeon G. W. McMillin, 5th Tennessee, and is represented in the cut (FIG. 161). Examiner A. Steele, of Oberlin, Ohio, certified, March 21, 1867: "Part of the femur is gone and the leg is short in proportion. There is exostosis of the femur, and suppuration is nearly constant; also anchylosis of what is left of the knee joint; unimpaired health," etc. Examiner A. H. Steele, of Olympia, W. T., certified, October 4, 1873: * * "There is lateral motion of the knee joint, caused by the proximity of the injury destroying the lateral

secondary excision October 25; recovery.—42-43. ROALDES (A. W.) (*Des fractures compliquées de la cuisse par armes de guerre*, Paris, 1871, p. 58, etc.) details 2 cases of excision in the shaft of the femur: Ch. Huart, Adjutant 193d Batt. Nat. Guards, nged 32; fracture of right femur at union of upper and middle thirds, May 21, 1871; excision June 2; death January 15, 1871. A. Cavarré, Lieutenant of Marines; shot fracture of upper third of right femur, May 21, 1871; excision June 10; recovery.—44-46. SOCIN (A.) (*Kriegschirurgische Erfahrungen*, Leipzig, 1872, pp. 135, 136) cites 3 cases of excision in the shaft of the femur: A. Leonhardt, shot fracture of left femur at juncture of middle and upper thirds, Gravelotte, August 18, 1870; excision of 7 centimeters of lower fragment; recovery. A. Leroy, shot fracture of right femur near trochanter, at Noisseville, August 31, 1870; excision September 24; death September 27, 1870. A. Primault, shot fracture of middle third of right femur, Wörth, August 6, 1870; excision October 26; recovery, with 12 centimeters shortening.—47. FISCHER (G.) (*Dorf Floing und Schloss Versailles*, in *Deutsche Zeitschrift für Chirurgie*, Leipzig, 1872, B. 1, p. 187) tabulates a fatal instance of secondary excision in the shaft of the femur.—48-50. BECK (B.) (*Chir. der Schussverletzungen*, Freiburg, 1872, p. 900) reports 3 cases of excision of shaft of the femur in the 14th Corps during the Franco-Prussian War, 1870-71. One recovered, one died; the result in the third instance is not recorded.—51. TRITTON (W. P.) (*Excision of a Large Portion of the Femur after Gunshot Wound*, in *The Lancet*, London, 1879, Vol. I, p. 117) resected the shaft of the femur on an Arab of the Turkish army, in December, 1877. The patient recovered, with 1½ inches shortening of the limb. Of the 51 cases here cited, the results could not be ascertained in 3 instances; 12 patients recovered, and 36 died, a mortality rate of 75.0 per cent.

[1] The extent of bone excised in the remaining cases was: One inch in 2 cases; two inches in 1; two and a half inches in 1; three inches in 2; three and a half inches in 2; four inches in 1; four and a half inches in 3; five inches in 1; six and a half inches in 1; trochanter major or a portion thereof in 3; and in 2 cases this point was not defined.

ligaments. There are also extensive cicatrices which are tender and painful. The limb at this time is more of an impediment than an advantage." The pensioner was paid March 4, 1879. In January, 1870, he was furnished with an apparatus for his injured limb by the firm of Marsh & Corliss, of Cincinnati.

CASE 411.—Lieutenant Dwight Beebe,[1] Adjutant 3d New York Veteran Vols., was wounded on October 27, 1864, while in command of a skirmish line on the Darbytown Road, near Richmond. He was, on the same day, admitted into the Flying Hospital of the Tenth Corps, near Chapin's Farm. Dr. C. M. Clark, late Surgeon 39th Illinois, under date of September 17, 1869, gives the following description of the case: "The wound was made with a conoidal ball, which entered the right thigh, outer surface, at the junction of middle with upper third, passing upward and inward, and making its exit at the upper and inner angle of Scarpa's triangle, slightly abrading the scrotum in its passage. On examination of the wound I found an extensive comminution of the femur, and removed sixteen (16) fragments before the operation was decided upon. * * I made a longitudinal incision from the great trochanter down, to the extent of five inches, and took away the upper fragment with a chain saw at its junction with the capsule (the bone above being sound). I then removed all the spiculæ attaching to the periosteum (which was preserved) and muscle, cleansing the wound thoroughly; then turned out the lower portion and removed it smoothly with the common amputating saw. Dr. N. Y. Leet assisted me in the operation." On October 28th, Lieutenant Beebe was taken to the landing near Deep Bottom, and placed on board a hospital transport and conveyed to Fortress Monroe, and admitted into the Chesapeake Hospital on the evening of November 1st. He was placed upon a fracture bed and received the best attention. There was a profuse discharge and the patient soon became exhausted. The upper extremity of the lower fragment necrosed, and a ring of bone seven-eighths of an inch in length exfoliated. This occurred in the middle of January, 1865. After the dead bone was eliminated, Lieutenant Beebe rallied. On May 17, 1865, he was able to be moved comfortably, and obtained a leave of absence and went to his home in New York. He returned to the hospital July 9th, and, in September, 1865, again went to the north with his regiment to be mustered out at the expiration of its term of service (*Circular* 2, p. 33). In a letter dated Havana, October 27, 1868, Mr. Beebe says: "I continued to improve until I was able to get around with a cane and supposed I was as well as I would ever be, until August, 1867, when my wound broke out and discharged terribly for about three weeks. The medical men here thought it was brought on by irritation, being on it too much. Now, with the exception of the limb being quite weak, it only troubles me in damp weather, when it has a dull heavy ache. It has all healed. The flesh on the outside of the thigh is quite numb. My knee is stiff. My general health is not good, and my physician cautions me to be very careful of myself. The limb measures 3⅛ inches short. Resection, 2¼ inches; necrosis of the bone, ⅞ inch." Pension Surgeon G. D Baley, of Havana, N. Y., examined Lieutenant Beebe in November, 1867, and reported: "Right leg is three inches shorter and three inches smaller in circumference than the other. There is anchylosis of the knee joint. The patient has repeatedly been confined to his room six weeks at a time. The wound is now discharging, the limb is weak and painful. He is constantly liable to fall in walking." In a letter to the editor, dated April 30, 1869, Dr. Baley describes the portion of the femur shown to him by Lieutenant Beebe's father, the upper division of the bone being "just below the greater trochanter obliquely downward from the outer side of the bone, to the middle of the lesser trochanter on the inner side; the lower division being a transverse cut embracing 1¼ or 1½ inches of the upper section of the bone. I think the head of the bone could not have been removed, as there is now, and was at the time of my first examination, the full development of the greater trochanter and neck of the femur. There is at this time great tenderness and pain both above and below the section of excision, with frequent suppurations. There is also evidence of a loss of portion of bone two or three inches below the lower section of the operation." Pension Surgeon F. J. Bancroft, of Denver, Colorado, reported, in September, 1875: "Ball entered anterior portion of thigh, fracturing upper third, and made its exit near the anus. Resection of two inches of the upper third of the femur was performed, causing shortening of three inches. The muscles are softer and smaller in this limb." Since that time the pensioner has been exempted from biennial examination, his disability being considered permanent. A copy of the photograph, furnished by the patient (*Contributed Photographs*, Vol. XII, p. 17), is represented in FIG. 162. He was paid March 4, 1879.

FIG. 162.—Result of excision in the upper third of the femur. [From a photograph.]

[1] The case of Lieutenant D. Beebe, Adjutant 3d New York, has been cited on page 32 of *Circular* 2, War Department, S. G. O., 1869, as an example of excision of the head of the femur. It had been stated by Lieutenant Beebe, in a communication to the editor, dated Havana, N. Y., November 2, 1868, shortly before the publication of *Circular* 2, that "the head of the bone was not taken out." A letter of inquiry was thereupon addressed to Dr. N. Y. LEET, late Surgeon 76th Pennsylvania, who had been officially reported as the operator on the register of the Tenth Corps field hospital, requesting information in the case of Lieutenant Beebe, and, in an answer dated Scranton, Penn., March 9, 1869, Dr. LEET stated that "about four inches of the femur, including the head, was removed," and, in a second communication, dated April 20, 1869, Dr. LEET asserted that "the style of the operation was first a longitudinal incision, cutting directly in the direction the ball took until I opened the capsule, thus exposing the head of the bone; by carrying the limb over the opposite thigh and pushing the limb upward I removed the head of the bone by sawing through the trochanter with a chain saw." These positive assertions of Dr. LEET led the editor to accept, in such a matter of anatomical detail, the statement of the surgeon rather than the impression of the patient. However, in September, 1869, after the publication of *Circular* 2, a letter dated Chicago, September 17, 1869, was received from Dr. CHARLES M. CLARK, late Surgeon 39th Illinois. In this communication Dr. CLARK gave the account of Lieutenant Beebe's case as detailed in CASE 411, above, and added that Dr. N. Y. LEET assisted him in the operation. Immediately upon receipt of this communication, on September 20, 1869, a copy of Dr. CLARK'S letter was forwarded to Dr. N. Y. LEET, at Scranton, for comment on the issue as to matter of fact between Dr. CLARK and himself; but no answer was ever received. In the meantime a letter had been sent by the editor to Dr. G. D. BALEY, Pension Examining Surgeon, of Havana, where Mr. Beebe then resided, asking whether, in his opinion, the head of the femur in the case of Lieut. Beebe had been removed. Dr. BALEY'S answer, dated April 30th, is included in the history (CASE 411), and corresponds with the statements of Dr. CLARK in regard to the extent of the operation. A letter from Lieut. Beebe, dated September 25, 1869, corroborated Dr. CLARK'S statement, and gave a description of the excised portion of the femur, then in the possession of his father. In addition to these facts, a letter was received from Dr. D. R. BROWER, late Assistant Surgeon U. S. V., dated Chicago, Decem-

In the next case six and one-half inches of the shaft of the femur, from the great trochanter downwards, were excised. By means of a prothetic apparatus and with the aid of a small cane the patient is enabled to make good use of his limb, although it is shortened six and one-half inches:

CASE 412.—Private J. W. Joslin, Co. I, 7th New York Heavy Artillery, aged 20 years, received a shot fracture of the right thigh at Cold Harbor, June 3, 1864. He was captured, and while in the hands of the enemy underwent the operation of excision of the femur. After being a prisoner for more than two months he was paroled and conveyed by steamer to hospital at Annapolis, where Surgeon B. A. Vanderkieft, U. S. V., recorded his admission, August 26th, with "shot wound of right femur." On November 28th the patient was transferred to Jarvis Hospital, Baltimore, whence Assistant Surgeon D. C. Peters, U. S. A., reported that "the parts were nearly healed on admission, and entirely so on December 31st, when the patient was furloughed, at which time the limb was shortened six inches and could be swung backward and forward, but could not be exercised in lateral or rotary motion." One month afterwards the man entered Dale Hospital at Worcester, whence Surgeon C. N. Chamberlain, U. S. V., reported his condition as follows: "He is in perfect health; the parts are free from tenderness, and the limb is movable in every direction and perfectly under the control of the muscles. The upper end of the femur is enlarged, apparently by new osseous growth, to almost twice its normal diameter, and it has a good false joint." On August 29th the patient was finally transferred to DeCamp Hospital, David's Island, whence Assistant Surgeon W. Webster, U. S. A., contributed the following history: "The wound was inflicted by a minié ball, which entered the gluteal region about four inches external to the os coccygis, passed downward, and struck the femur a little below the trochanter major, producing a compound comminuted fracture of the upper half of the shaft of the bone. Excision of six and a half inches of the femur, extending downward from a point immediately below the great trochanter, was performed by a surgeon of the Confederate army. This operation was done fifty-four hours after the injury, by a linear incision seven and a half inches long in the axis of the limb, beginning from a point opposite the superior portion of the trochanter major, and on the same day the patient was transferred thirteen miles in an ambulance to Richmond, where he was placed in hospital No. 21. He stated that he was in a very weak and exhausted condition when he reached Richmond. His limb was then placed in a fracture-box, and whiskey was administered twice daily, his diet consisting of corn and wheat bread and inferior soup. Extensive sloughing of the soft parts of the thigh occurred in the third week. On October 26, 1865, the patient was discharged from service, at which time a careful examination of the injured thigh revealed union of the trochanter major with the upper extremity of the lower fragment of the resected femur. There was also extensive deposit of new bone, and the degree of shortening amounted to six and a half inches. He could bear his entire weight upon the injured limb without producing any apparent yielding of the united bone. The flexion of the thigh was natural, and when it was rotated the trochanter major performed its entire and natural circuit. The thigh and leg were very much atrophied, but the knee joint flexed freely, and the cicatrix, though extensive on account of the sloughing of the parts, was firm and healthy. The gastrocnemius and extensor muscles of the foot were rigidly contracted, and the foot was extended to its utmost capacity." One week before receiving his discharge the patient was furnished by Dr. E. D. Hudson, of New York City, with a prothetic apparatus,[1] consisting of a case of raw hides, laced upon the thigh and leg, and terminating in an artificial foot with ginglymoid articulations at the ankle and toes. By means of this appliance he was enabled to walk with ease, requiring only the aid of a light cane. In a communication from the pensioner in March, 1868, he stated that "the apparatus works very well," considering the condition of the limb, and added that he had not had any abscesses about the hip or any part of the injured leg. Various examining surgeons at successive dates certified to the injury and operation resulting in shortening, etc., and the San Francisco Board added, in 1877: "The result is good, and

FIG. 163.—Result of primary excision in the shaft of the femur. [From a photograph.]

ber 24,1877, in which the following occurs: "CASE XXX, of the same *Circular*, in my opinion, is not correctly reported. I treated Lieut. Beebe from his admission into the Chesapeake Hospital until he was considered well enough to be sent north. This case, in my judgment, was not of the magnitude the report represents it. The fractured portions of the femur were removed, and the ends of the bone smoothed off; the head of the femur was not removed from the cotyloid cavity. In this opinion, I am pleased to say, I am sustained by Surgeon D. G. RUSH of this city, who was one of the staff of the Chesapeake Hospital at the time the patient was under my treatment, and who repeatedly saw the case with me. He recollects distinctly to have felt, at the time the man was admitted, the head of the femur in its proper position. Surgeon CLARK, of the 39th Illinois regiment, told me, a year or two afterwards, that *he* performed the operation, and described it just as I have done above." From a careful examination of all the correspondence and records on file in this Office, it is evident that the head of the femur was not removed from the cotyloid cavity, that an excision in the upper third of the shaft of the femur was performed by Dr. C. M. CLARK, and not by Dr. N. Y. LEET, and that the account of the injury and of the operation as published on page 32 of *Circular* 2, on the authority of Dr. N. Y. LEET, is erroneous. On July 17, 1879, another letter was addressed to Dr. N. Y. LEET, asking him whether he would deny the correctness of the account of the case as furnished by Dr. C. M. CLARK and the pensioner, Mr. D. Beebe. To this, as well as to a prior letter of similar tenor, no answer has been received at the date of this writing (September 8, 1879). This case has been published as an excision of the hip joint by Dr. H. CULBERTSON (*Excision of the Larger Joints of the Extremities*, Philadelphia, 1876, p. 64), and as a resection of the hip joint by Professor E. GURLT (*Die Gelenk-Resectionen nach Schussverletzungen*, Berlin, 1879, p. 203), and it is to be regretted that the erroneous version of the operation has misled these reliable authorities on excisions.

[1] The apparatus is figured on page 33 of E. D. HUDSON'S *Mechanical Surgery, Prothetic Appliances and Apparatus for Amputations, Resections, Ununited Fractures, Diseases of Joints, Deformities, Curvatures of Spine and Paralysis*, New York, 1878.

the leg, by the use of a mechanical apparatus, is of use to the man." The pensioner was paid March 4, 1879. Photographs of the patient, taken in 1865, and showing his appearance without and with the apparatus, were contributed by Dr. Webster (*Contr. Photo's*, A. M. M., Vols. 9 and 10, pp. 31, 32, and 33) and copied at the Army Medical Museum (*Surg. Phot. Series*, Nos. 106 and 107). The former is represented in the wood-cut (FIG. 163).

CASE 413.—Captain S. V. Shipman, Co. E, 1st Wisconsin Cavalry, aged 38 years, was wounded in the right thigh during the engagement at Whitewater River, April 24, 1863. Two days after the reception of the injury he was admitted to the Post Hospital at Cape Girardeau, whence Surgeon W. McClellan, 1st Nebraska, reported the wound as "a fracture of the femur, caused by gunshot, for which primary resection of three and a half inches at the upper third was performed, the ends of the bone being clipped off. Patient left the hospital on leave of absence July 17th." Captain Shipman was subsequently promoted to Major, and ultimately mustered out as Brevet Colonel on July 19, 1865. In his application for pension he alleged that the ball was not found nor removed from his thigh until eight months after the reception of the wound. Examiner A. J. Ward, of Madison, Wisconsin, October 23, 1866, certified to the injury and operation resulting in contraction of the leg and stiffness of the knee, and added: "The pensioner has had an abscess form three different times; the last time it laid him on his back some six weeks. It may recur any time, as there is evidently diseased bone in the femur." Dr. H. A. Martin, late Surgeon, U. S. V., in a letter, dated Boston, April 24, 1869, makes reference to this case as follows: "When I was stationed at Cape Girardeau a most interesting case, that of Captain Shipman, was under my care to a perfect successful issue. He lost nearly four inches of the whole shaft of the femur, including portion of the trochanters, and is now living, with a limb shortened some two and a half inches." This pensioner was paid June 4, 1879.

TABLE XXII.

Summary of Twenty Cases of Recovery after Primary Excision of the Shaft of the Femur for Shot Injury.

No.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	INJURY, OPERATION, AND RESULT.
1	Beebe, D., Adjutant, 3d New York, age 25.	Oct. 27, 27, '64.	Right; three and a half ins. from junct. with caps. to level of troc. minor, by Surg. C. M. Clark, 39th Ill. Mustered out Sept., 1865. *Surg. Phot.* 210; pens'd.
2	*Brewer, J. W.*, Pt., C, 4th Tenn. Cav., age 40.	Aug. 14, 14, '64.	Right; four and a half ins., including great trochanter, by Surg. — Sevenson, 4th Tenn. Cav'y. Released June 16, '65; two and a half ins. shortn'g. *Circular* 2, 1869, p. 58.
3	[1] Button, F. H., Musician, I, 14th Mich., age 18.	July 6, 6, '64.	Left; four ins. upper third, by Surg. E. Batwell, 14th Mich. Disch'd May 5, 1865; pens'd; ligamentous union; three inches shortening.
4	[2] B——, S., 7th Kentucky Mounted Inf'y, age —.	April 6, 6, '62.	——; two and a half inches from upper third, by Surgeon S. F. Clardy, C. S. A. Recovered; ends of bone united well; limb of great use.
5	*Calhoun, W. F.*, Serg't, F, 5th Virginia, age 25.	Mar. 25, 25, '65.	Right; mid. third, by Surg. G. R. Sullivan, 39th N. J. Erysipelas. Released June 11, 1865.
6	Conner, S., Colonel, 19th Maine, age 25.	May 6, 6, '64.	Right; two ins., fragment, middle third, by Surg. J. F. Dyer, 19th Mass.; June, hæms.; Sept., bone extracted. Disch'd April 7, '66, as Brig. General; pensioned; anchylosis of knee joint; leg entirely useless.
7	Gebhardt, J., Pt., B, 149th New York, age 22.	July 2, 3, 1863.	Left; about two ins. up. third, by Surg. J. V. Kendall, 149th N. Y. Disch'd March 1, 1865; pens'd; shortening, ulceration, and deformity. *Cont. Phot. Series*, Vol. 4, No. 8.
8	Harris, B. F., Lieut.-Col., 6th Maine, age 32.	Nov. 7, 7, '63.	Left; three ins., neck, trochanter, upper third. Discharged July 19, 1864; pensioned; shortened three inches.
9	Hartman, L., Pt., E, 24th Mich., age 16.	June 1, 1, '64.	Right; three ins., upper third, by Surg. J. H. Beech, 24th Mich.; gang. Disch'd Aug. 22, 1865; pens'd; four ins. shortening.
10	Hayes, W. J., Pt., L, 16th Penn. Cavalry, age 18.	June 11, 11, '64.	Right; five ins. middle third, by Surg. F. Le Moyne, 16th Penn. Cav.; necrosis. Disch'd June 20, 1865; pensioned; three inches shortening; fistulous opening.
11	Joslyn, J. W., Pt., I, 7th New York Heavy Artillery, age 20.	June 3, 5, '64.	Right; six and a half ins. from great troch. downward, by Conf. surg. Disch'd Oct. 26, 1865; pens'd; seven ins. shortening. *Surg. Phot. Ser.*, Nos. 106, 107. *Circ.* 6, 1865, p. 68.
12	Keyser, M., Pt., E, 9th Kansas Cav., age 40.	June 17, 20, '63.	Left; one inch middle third, by A. A. Surg. J. Thorne. Also exc. r't radius. Disch'd March 1, 1864; compl. union; two ins. shortening; not pensioned.
13	McLaughlin, G. H., Lt., H, 2d Infantry, age —.	July 2, 3, '63.	Left. Duty Oct. 9, 1864; retired Dec. 31, 1870.
14	[3] Reynolds, J. C., Pt., E, 5th N. Jersey, age 24.	May 5, 8, '62.	Left; portion of trochanter major. Disch'd Aug. 18, '64; not pens'd.
15	Shanley, J., Pt., A, 76th New York, age 24.	May 24, 26, '64.	Left; portion of trochanter major. Duty Nov. 15, 1864; pensioned; hip joint stiffened; necrosis.
16	[4] *Shelley, J. H.*, Pt., L, 3d Kentucky Cavalry, age 15.	June 10, 10, '64.	Four and a half ins. middle third, by Surg. S. F. Clardy, C. S. A. Disch'd Dec., 1864; union complete; four and a half ins. short'g.
17	Shipman, S. V., Capt., E, 1st Wisconsin Cav., age 38.	April 24, 24, '63.	Right; three and a half ins. upper third and portion of troch. maj. Promoted Maj. Disch'd July 19, 1865; pensioned; two and a half ins. shortening; aneh. knee.
18	Shock, A., Pt., A, 4th Penn. Reserves, age 23.	Mar. 11, 12, '62.	Right; four and a half ins., fragments, up. third, by Ass't Surg. J. S. Billings, U. S. A. Disch'd Oct. 10, 62; pensioned; five ins. short'g. *Med. and Surg. Hist.*, Pt. II, Vol. II, p. 367.
19	Thibaut, F. W., Capt., A, 7th New York, age 28.	Dec. 13, 13, '62.	Left; trochanter major, by Surg. C. Gray, 7th N. Y. Also amp. left ring finger. Disch'd May 8, 1863; pensioned.
20	Tirtlot, W. M., Lieut., F, 105th Ill., age 24.	May 15, 15, '64.	Right; four ins. middle third, by Surg. A. W. Reagan, 70th Ind. Disch'd Nov. 28, 1864; pens'd; limb an impediment. *Spec.* 2159.

The injuries are reported to have been inflicted by shell fragments in two instances, by a fuse plug in one, and by small projectiles in seventeen cases. Sixteen of the twenty operations were performed by Union and four by Confederate surgeons.

Fatal Cases of Primary Excision in the Shaft of the Femur.—Of the sixty-five cases of this group, the operation was performed on Union soldiers in fifty-three and on Confederate soldiers in twelve instances. The right femur was involved in thirty, the left in twenty-six cases; in nine the side of the injury was not indicated.

CASE 414.—Private A. A. Shaw, Co. C, 9th Missouri State Militia Cavalry, was accidentally wounded in the left thigh by a conical ball, April 1, 1863. He was admitted to the general hospital at Rolla, and operated on by Surgeon H. Culbertson, U. S. V., who described the case as follows: "A compound comminuted fracture of the femur at the lower third, the bone being broken into small fragments, and small spiculæ being thrown over the internal surface of the wound; orifice of exit two and a half inches in diameter, and located on inner side of thigh. The vasti, biceps, semi-membranosis, and tendinosis, rectus, and adductors (below) were lacerated as high as the middle third and down to the knee joint, which was not involved. The large vessels were uninjured. The patient was vomiting, being cold and prostrated; pulse 140. Under these circumstances I determined, on consultation, to stimulate and anæsthetize, then remove all loose portions of bone and resect the ends of the femur as far as they were denuded of periosteum, amputation being precluded by the great prostration. In three hours, the pulse having become somewhat fuller and slower and the general surface warmer, I performed the resection. Under the influence of chloroform the patient's pulse grew stronger, and after the operation he seemed better. He recovered from the effects of the anæsthetic in due time, but never rallied fully from the shock of the injury, and his system gradually failed, though supported by full doses of morphia and brandy. He died eighteen hours after the reception of the injury, being conscious of his approaching end."

CASE 415.—Private *Jonathan Wallace*, Co. F, 21st Georgia, aged 38 years, was wounded by a conoidal ball, in the charge on Fort Steadman, March 25, 1865. The missile entered on the external surface of the left thigh at the lower portion of the middle third, passed obliquely upward and inward, fractured the femur through the middle third, and emerged on the internal surface an inch above the wound of entrance. He was taken to the field hospital of the 2d division, Ninth Corps, where Surgeon G. W. Snow, 35th Massachusetts, reports that "resection at the middle third of the femur was performed by Surgeon G. R. Sullivan, 39th New Jersey, and anterior splints applied." On April 10th, he was admitted into the Armory Square Hospital, Washington. Acting Assistant Surgeon George K. Smith reports "that the injured limb was shortened one inch; extension was applied (Buck's method) with a weight of eleven pounds, after which there was no shortening. Patient did remarkably well until June 8th, when he was attacked with diarrhœa, which was arrested at the end of three days. On June 23d, the bone appeared to be firmly united with half an inch shortening, and, on July 2d, extension was removed, and the patient rode about the ward in an invalid chair. July 28th, it was discovered that the limb had shortened two and one-fourth inches; extension was reapplied with a weight of sixteen pounds, and, on August 5th, it measured three-fourths of an inch shorter than its fellow. On August 15th, a photograph of the patient was taken [No. 92 of the *Surgical Photograph Series* of the Army Medical Museum, a reduced copy of which is represented in the wood-cut, FIG. 164]. On August 17th, the wound had nearly healed, his condition was remarkably good, and the bone had apparently united." On this date he was transferred to the Douglas Hospital, Washington, to the care of Assistant Surgeon W. F. Norris, U. S. A., who reports: "The wound was still open and discharging a small quantity of matter, but there was firm union of the broken femur, and the patient could without assistance raise his leg from the bed. His general health seemed to be improving, and he daily rode about the ward in a wheeled chair, the limb being supported in an extended position. August 26th, several small loose fragments of bone were removed. August 28th, had a severe chill; on the 29th, had an attack of erysipelas in the thigh, and, on the following day, a loose piece of necrosed bone, one and a half inches in length, was removed. On September 2d, erysipelas had spread down to ankle joint. 11th, erysipelas had disappeared; another small sequestrum was removed from the posterior wound. 16th, had two chills, diarrhœal passages, and vomiting. 21st, he steadily grew weaker; the wound had almost ceased to discharge. There was slight icterus; the countenance was pinched and anxious and the breathing labored. 22d, he had pain in chest and abdomen, and was unable to pass his urine. These symptoms continued until the evening of the 23d, when death ensued from pyæmia. At the autopsy, fifteen hours after death, the brain appeared healthy; but there was a large amount of serous subarachnoid effusion. Both lungs were adherent and thickly studded with pyæmic patches, most of which were dark colored and hardened, a few only having softened, and containing pus. There was considerable serous effusion in the left pleural sac. The spleen was enlarged but not softened; the other thoracic and abdominal viscera appeared healthy. The fractured femur [which is represented in the adjoining wood-cut, FIG. 165] was removed and sawn longitudinally; above the fracture the marrow and interspaces between the cancelli presented a reddish chocolate hue, below, it appeared reddened and inflamed; it had not, in either locality, any gangrenous odor. The femoral vein [represented in PLATE XXX, opposite] was found to contain old and partially disintegrated blood clots, and in some portions also a quantity of healthy looking creamy pus; its walls were much thickened. It continued to present the same appearance up to about two inches below its

FIG. 164.—Appearance five months after excision in middle third of femur. [From a photograph.]

FIG. 165.—Ends of fractured left femur united six months after shot injury. *Spec.* 1354.

PLATE XXX. OBSTRUCTED FEMORAL VEIN

junction with the internal iliac vein; here the clots ceased, and the coats of the vein, although of reddish hue, did not appear much thickened. The pus was carefully examined with the microscope and presented its usual round corpuscles, which under the application of acetic acid exhibited distinctly their characteristic double and triple nuclei. The femoral artery appeared to be healthy."

CASE 416.—Private W. J. Beck, Co. D, 2d Pennsylvania Heavy Artillery, aged 18 years, was wounded at Petersburg, June 18, 1864. Surgeon M. K. Hogan, U. S. V., recorded his admission to the field hospital of the 1st division, Ninth Corps, with "shot wound of left thigh." Surgeon N. R. Moseley, U. S. V., reported the following: "The patient was admitted to Emory Hospital, Washington, June 24th, with fracture of the middle of the upper third of the left femur, caused by a minié ball, and resulting in resection, which operation was performed on the field on June 19th. The treatment consisted of cold-water dressings, and stimulants and nutritious diet. Death occurred July 8, 1864." The upper third of the injured femur was contributed to the Museum by Acting Assistant Surgeon W. H. Ensign, and is represented in the cut (FIG. 167). The specimen shows no bony deposit, and the shaft is stripped of periosteum for some distance below the seat of the injury.

FIG. 166.—Upper portion of right femur, showing excision. *Spec.* 2947.

FIG. 167.—Upper third of left femur, showing excision. *Spec.* 2816.

CASE 417.—Private J. Fearing, Co. G, 21st Massachusetts, aged 23 years, received a gunshot fracture of the right thigh at Cold Harbor, June 3, 1864. He was admitted to the field hospital of the 1st division, Ninth Corps, where the operation of resection was performed but not recorded, and several days afterwards he was conveyed to Washington. Acting Assistant Surgeon P. O. Williams described the injury and its result, as follows: "The patient was admitted to Emory Hospital, June 7th, with compound comminuted fracture of the femur at the upper third, caused by a minié ball, which entered anterior to the femoral artery, passed backward and outward, and emerged on the opposite side. Two and a half inches of the bone had been excised the day after the injury, through an incision four inches in length. The general treatment consisted of tonics, stimulants, astringents, and generous diet. Pulley extension, sand bags, and bandages were applied to the limb and cold-water dressings to the wound. Small spiculæ of bone and a small piece of lead about the size of a pea were removed on June 30th. The patient died August 3, 1864, of exhaustion resulting from the excessive discharge of the wound and from severe diarrhœa, which had troubled him the last two weeks. The *post-mortem* revealed necrosis of both excised extremities, extending from one to one and a half inches. There was abundant deposit of osseous matter on the upper portion, but upon the lower part only a little was found on the posterior aspect." The upper half of the injured femur was contributed by Surgeon N. R. Moseley, U. S. V., and is shown in the cut (FIG. 166).

In the following case severe hæmorrhage occurred on the twentieth day after the injury, and amputation in the upper third of the thigh was performed:

CASE 418.—Corporal J. W. Soule, Co. D, 6th Michigan Cavalry, aged 27 years, was wounded in the right thigh at Boonesboro', July 8, 1863. Surgeon S. B. W. Mitchell, 8th Pennsylvania Cavalry, recorded his admission to the Cavalry Corps field hospital, and noted that a resection was performed. On July 21st the wounded man was transferred to the Frederick Hospital, whence Acting Assistant Surgeon J. H. Bartholf contributed the specimen (FIG. 168), with the following history: "The wound was caused by a rifle ball, which entered below the nates and fractured the femur at the lower part of the upper third. A portion of the bone was removed on the evening following the injury, and sand bags were kept to the sides of the limb until the day before the patient was removed to this hospital, when a long outer splint was applied. On admission the limb was in very good condition and shortened only one and three-quarter inches. On July 23d the long splint had become displaced and was doing harm, when I removed it and substituted Buck's extension (pulley, weight, and sand bags). On the following day the patient felt comfortable and the wound looked well; the shortening now amounted to two and three-quarter inches. On the next day the extension was increased by additional weight. A moderate flow of hæmorrhage from the wound took place on July 26th, which could not be controlled by pressure on the common femoral artery, and did not cease until after five minutes' continuance of the pressure. The amount of blood lost was estimated at six ounces. Exploration showed the sawn end of the upper fragment to be denuded a finger's breadth; but the upper end of the lower fragment could not be felt nor reached. On the 28th a collection of pus was detected, by examination with the finger, in a cavity at the inner side of the upper fragment, and at 8.30 P. M. of this day another hæmorrhage, uncontrollable by pressure on the femoral artery, to the amount of eight ounces took place. Stimulants and opiates were then given to procure sleep and time in order to enable the patient to recover, in part at least, from the effects of the hæmorrhage and undergo an operation, for which, with a view of having the further advantage of daylight, the following morning was determined upon. At 4 o'clock A. M. the next day there was another hæmorrhage, estimated at six ounces, and when the patient had pretty well recovered, amputation was performed by transfixion through the site of the wound, making antero-posterior flaps. The patient did not rally well. He died two hours after the operation. At the *post-mortem* examination, the thoracic and abdominal organs were found to be healthy. The hæmorrhages were discovered to have occurred from a large orifice plainly to be seen in the upper end of the lower portion of the severed sciatic artery, the ball having evidently found the vessel lying in its course and disrupted it. The blood not coming from any branch of the femoral explains the non-control of the flow by pressure thereon, as was believed at the time. The bleeding and stopping was probably due to the closing of the orifice by the end of the bone, and to its shifting, and perhaps to other causes. The two sawn ends of the bone were necrosed for the space of one-quarter inch to an inch, beyond which a good amount of callus was thrown out."

FIG. 168.—Upper half of right femur. *Spec.* 3854.

TABLE XXIII.

Summary of Sixty-five Fatal Cases after Primary Excision of the Shaft of the Femur for Shot Injury.

NO.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	INJURY, OPERATION, AND RESULT.
1	*Austin, M. G.*, Pt., D, 21st Virginia, age 24.	July 2, 3, '63.	Right; up. third; Sept. 26, bony union. with lateral curvature. Died Dec. 2, 1863, of wounds.
2	*Ball, C. H.*, Capt., K, 6th Va. Cav., age 29.	May 7, 9, '64.	Left. Died May 14, 1864.
3	Becht, J., Pt., B, 7th Maryland, age 38.	Mar. 31, 31, '65.	Right; mid. third, by Surg. R. K. Robinson, 7th Md.; April 12, amp. up. third. Died April 12, 1865, shock.
4	Beck, W. J., Pt., D, 2d Penn. Heavy Art'ry, age 18.	June 19, 19, '64.	Left; upper third; no attempt at union. Died July 8, 1864. Autopsy. *Spec.* 2816.
5	Bittle, M., Pt., K, 36th Wisconsin.	Je. 18,'64, Primary.	Right; mid. third, by Surg. S. H. Plumb. 59th N. Y. Died June 21, 1864.
6	*Boss, D. W.*, Pt., K, 64th Georgia, age 20.	Feb. 6, 7, '65.	Right; three inches upper third. Died February 9, 1865.
7	Brown, J. E., Corp'l, F, 86th New York.	July 2, 2, '63.	Middle third. Died July 11, 1863.
8	Brozier, N. P., Pt., I, 101st Ohio, age 27.	June 27, 27, '64.	Right; neck, by Surg. S. H. Kersey, 36th Ind. Died July 6, '64.
9	Burch, O., Pt., G, 111th New York, age 17.	April 2, 5, '65.	Left; three ins. mid. and upper thirds, by Act. Staff Surg. W. J. Burr, U. S. A.; sloughing. Died July 18, '65, exhaustion. Autop.
10	Burt, E. E., Pt., C, 8th New York Heavy Art.	June 17, 17, '64.	Right; four ins. lower third, by Surg. N. Hayward, 20th Mass. Died June 20, 1864.
11	Carroll, L., Serg't, H, 1st Delaware, age 22.	Oct. 22, 22, '64.	Right; mid. third; Nov. 11, hæm.; lig.; amp. hip. joint. Died Nov. 19,'64; pyæm. *Spec.* 1020. *Circ.* 6, '65, p. 50. *Circ.* 7, '67, pp. 38, 62. See CASE 298, p. 139, *ante*.
12	Clark, R., Pt., B, 55th Illinois.	May 17, 18, '62.	Left. Died May 20, 1862.
13	Conner, S. L., Pt., E, 82d Ohio.	July 1, 1, '63.	Right; middle third. Died July 16, 1863.
14	*Cox, R.*, Serg't, L, 1st S. Carolina Sharpshoot'rs.	June 30, J'y 3, '62.	——; up. third; bones of pelvis also fractured. Died July 11, '62.
15	Dawson, J., Pt., G, 48th New York, age 32.	Aug. 16, 16, '64.	August 18th, gangrene. Died August 19, 1864.
16	Daniel, R., Pt., F, 13th West Virginia, age 37.	Oct. 19, 19, '64.	Left; six inches upper and middle thirds. Died Nov. 7, '64; pyæm. Autopsy.
17	Delinger, C., Pt., D, 200th Pennsylvania.	Mar. 25, 25, '65.	Left; upper third. Died March 29, 1865.
18	Engle, J., Government employé, age 19.	Mar. 16, 18, '64.	Right; middle third, by Surg. B. Woodward, 22d Ill. Died Mar. 24, 1864.
19	Evans, J., Pt., I, 57th Indiana.	June 15, 15, '64.	Right; upper third, by Surg. E. B. Glick, 40th Ind. Died June 29, 1864.
20	Fearing, J., Pt., G, 21st Mass., age 23.	June 3, 4, '64.	Right; two and a half ins. upper third; June 31, spic. removed; nec. Died Aug. 3, '64. *Spec.* 2947.
21	Foster, F., Serg't, F, 1st New York Dragoons.	April 2, 2, '65.	Left; middle third. Died May 5, 1865.
22	*Gillis, G.*, Serg't, G, 61st Georgia, age 24.	June 2, 2, '64.	Upper and middle thirds. Died June 10, 1864
23	Harris, L. W., Pt., I, 84th Indiana.	Aug. 8, 8, '64.	Middle third, by Ass't Surg. W. H. Matchett, 40th Ohio. Died Sept. 5, 1864.
24	*Hill, J. M.*, Pt., C, 11th Alabama, age 21.	May 24, 24, '64.	Right; three ins. middle third. Died June 9, 1864.
25	Holmes, J., Lieutenant, E, 40th Indiana.	June 17, 17, '64.	Right; upper third, by Surg. E. B. Glick, 40th Ind. Died June 25, 1864.
26	*Hood, S.*, Pt., D, 6th South Carolina.	Dec. 10, 10, '64.	Eight ins. from lesser trochanter down. Died Dec. 11, 1864.
27	Hyatt, J., Pt., F, 57th Indiana.	May 27, 27, '64.	Left; middle third, by Surg. E. B. Glick, 40th Ind. Died June 24, 1864.
28	Lambert, J. S., Pt., I, 30th Wisconsin, age 36.	Sept 14, 14, '64.	Left; entire middle third, by A. A. Surg. A. Kelly. Died Sept. 14, 1864, shock.
29	*Ledwell, J.*, Pt., B, 52d North Carolina.	July 14, —, '63.	Right; three inches up. third, including troc. maj., by Surg. R. W. Pease, U. S. V. Died on the eighth day. *Spec.* 1476.
30	Lewis, W. H., Pt., F, 11th New Jersey.	June 18, 18, '64.	Left; middle third, by Surg. N. Hayward, 20th Mass. Died June 24, 1864.
31	[1]Libby, J. C., Serg't, I, 17th Maine.	Dec. 13, 13, '62.	Left; middle third. Died Jan. 2, 1863.
32	Matthews, J. S., Pt., B, 3d Iowa Cavalry.	May 25, 25, '63.	Right; upper third. Died May 30, 1863.
33	Mayer, J. B., Pt., C, 9th Indiana.	Sept. 3, 3, '64.	Middle third, by Ass't Surg. W. H. Matchett, 40th Ohio. Died Sept. 3, 1864, of wounds.
34	McIlhany, P., Pt., C, 88th New York.	May 5, 5, '64.	Left; three inches mid. third, by Surg. W. O'Meagher, 69th N. York. Died May 5, 1864.
35	Meeks, W. A., Pt., F, 125th Ohio.	Sept. 19, 19, '63.	Right; upper third, by Surg. H. McHenry, 125th Ohio. Died Nov. 3, 1863, exhaustion.
36	Mehwaldt, H., Pt., B, 8th New York Heavy Artillery.	June 18, 18, '64.	Right; six inches mid. third, by Surg. N. Hayward, 20th Mass. Died June 21, 1864.
37	Messenger, I., Pt., F, 112th Illinois, age 25.	Aug. 6, 6, '64.	Right; three inches upper third, by Surg. C. S. Frink, U. S. V. Died, Sept 2, 1864, of wounds.
38	Milkie, W., Pt., D, 26th Wisconsin.	July 20, 20, '64.	Left. Died August 7, 1864.
39	Mock, A., Pt., K, 55th Pennsylvania.	Mar. 30, 30, '65.	Left; four inches mid. third, by Surg. C. M. Clark, 39th Illinois. Died March 31, 1865.
40	*Moore, H.*, Pt., H, 36th Alabama.	Nov. 27, 28, '63.	Left; lower third, by Surg. J. C. Morgan, 29th Mo. (gang. of foot, amp. foot). Died Dec. 6, 1863.
41	Personius, S. W., Pt., G, 109th N. Y., age 21.	May 6, 6, '64.	Left; upper third. Died May 20, 1864.
42	Peterson, C. M., Pt., I, 6th Iowa.	June 27, 27, '64.	Right; four ins. lower third, by Surgs. W. Graham, 40th Ill., and W. Lomax, 12th Ind. Died July 20, 1864.
43	Phinney, J. A., Corp'l, B, 31st Maine, age 22.	April 2, 2, '65.	Right; upper third, by Surg. J. A. Hayes, 11th New Hampshire. Died April 16, 1865.
44	Potter, R. E., Serg't, H, 1st N. York Dragoons, age 26.	May 12, 12, '64.	Right; two ins. middle third, by Surg. B. T. Kneeland, 1st N. Y. Drag's. Died June 18, '64; pyæm.
45	Pugh, J. M., Corp'l, F, 38th Ohio.	Sept. 1, 1, '64.	Upper third. Died Sept. 14, 1864.
46	Ramage, E., Pt., I, 15th Ohio.	June 25, 25, '63.	Left; three inches. Died June 28, 1863. *Spec.* 1752.
47	Ruckel, D., Pt., I, 14th Ohio.	June 16, 16, '64	Right; upper third, by Surg. C. N. Fowler, 105th Ohio. Died June 27, 1864.
48	Shaw, A. A., Pt., C, 9th Missouri S. M. Cav.	April 1, 1, '63.	Left; lower third, by Surg. H. Culbertson, U. S. V. Died April 2, 1863. Autopsy.
49	Small, E., Pt., E, 69th New York.	Sept. 17, 17, '62.	Left. Died October 2, 1862.
50	Smith, C., Serg't, K, 3d Ohio Cavalry.	May 21, 21, '63.	Right; middle third. Died May 25, 1863.
51	Soule, J. W., Corp'l, D, 6th Mich. Cav., age 27.	July 8, 8, '63.	Right; upper third; hæms.; 29th, amputat'n up. third. Died July 29, 1863, of hæm. *Spec.* 3854.
52	Sullivan, J., Pt., F, 57th Indiana.	May 27, 27, '64.	Left; middle third. Died June 17, 1864, of wounds.
53	Thomas, R. M., Serg't, E, 129th Ind., age 28.	Mar. 10, 10, '65.	Left; four inches, by Surg. G. W. Carr, 129th Ind. Died March 20, 1865, exhaustion.
54	[2]—— ——, Lieut., 118th or 115th Penn., age 30.	Sept. 17, 17, '62.	Four inches middle third, by Surg. H. W. Rivers, 4th Rhode Island. Died Sept. 19, 1862.
55	Vining, M. R., Lieut., A, 7th Maine.	May 12, 12, '64.	Right; four inches upper third, by Surg. F. M. Eveleth, 7th Maine. Died May 19, 1864.
56	*Wallace, J.*, Pt., C, 21st Georgia, age 37.	Mar. 25, 25, '65.	Left; mid. third, by Surg. G. R. Sullivan, 39th N. J.; Aug. 26th and Sept. 11, rem. frags. Died Sept. 23, 1865; pyæmia. *Spec.* 1354. *Photo. Series*, No. 92.
57	Washburne, E. A. B., Pt., D, 10th New York Cavalry, age 23.	April 6, 6, '65.	Right; upper third. Died April 19, 1865, exhaustion from hæm.
58	White, J., Lieut., G, 1st Penn. Reserves, age 30.	May 12, 12, '64.	Right; troch. minor, and frag. upper third, by Surg. L. W. Reed, U. S. V. Died May 18, 1864; pyæmia.
59	Williams, P. I., Lieut., E, 76th Illinois.	June 21, 21, '63.	Upper third, by Surgs. C. Carle, 41st Ill., and B. F. Stephenson, 14th Ill. Died in three-quarters of an hour.
60	Williams, B., Pt., C, 76th Colored Troops.	April 9, 9, '65.	Left. Died April 12, 1865.
61	Wishmire, C. E., Pt., A, 27th Indiana, age 33.	July 3, 5, '63.	Left; by Surg. W. H. Twiford, 27th Ind.; 12th, hæm. Died July 15, 1863.
62	Wolf, M. B., Serg't, E, 11th Ohio.	Nov. 24, 25, '64.	Right; three inches. Died Dec. 9, 1863.
63	Wool. C., Pt., M, 9th New York Cavalry.	June 11, 11, '64.	Right; upper third. Died June 13, 1864.
64	*Wright, H. A.*, Lieut., G, 6th Virginia, age 23.	July 30, Au. 1, '64.	Right; upper and middle thirds. Died Aug. 5, 1864.
65	*Yancey, T. H.*, Serg't. B, 48th Alabama, age 33.	Oct. 7, 7, '64.	Left; four inches upper third. Died Oct. 25, 1864.

[1] O'MEAGHER (W.), *Casualties of the Battle of Fredericksburg*, in *Am. Med. Times*, 1863, Vol. VI, p. 179.

[2] Supposed to be Lieutenant R. M. Johnston, Adjutant 125th Pennsylvania.

In ten of the sixty-five fatal cases of primary excision[1] in the shaft of the femur the point of resection was not indicated; in twenty-five instances the excision was in the upper third; in five, in the upper and middle thirds; in twenty-one, in the middle third, and in four, in the lower third.

Undetermined Cases of Primary Excision in the Shaft of the Femur.—There are six cases of this group; the data are very meagre, and in five of the six cases not even the names of the patients are recorded:

TABLE XXIV.

Summary of Six Cases of Primary Excision in the Shaft of the Femur with Unknown Results.

No.	Name, Military Description, and Age.	Dates.	Operations, Operators, Result.	No.	Name, Military Description, and Age.	Dates.	Operations, Operators, Result.
1	*Gosa, J. A.*, Pt., K, 36th Alabama.	Nov. 27, 28, '63.	Right; lower third. Surg. J. C. Morgan, 29th Mo.	4	Unknown.	July 3, 3, '63.	Left; middle third; nine inches. *Spec.* 1552.
2	Unknown.	May 6, 6, '64.	Left; five and a half inches excised. *Spec.* 2671.	5	Unknown.	May —, —, '64.	Left; six and a half inches lower third. *Spec.* 2410.
3	Unknown.	May 6, 6, '64.	Left; eight and a half inches. *Spec.* 2644.	6	Unknown.	May 3, 3, '63.	L't; seven and a half ins. Surg. J. Y. Cantwell, 82d Ohio, and A. A. Surg. A. D. Kibbee. *Spec.* 1374.

Intermediary Excisions in the Shaft of the Femur.—This category comprises forty-eight cases, with nine recoveries and thirty-nine deaths, a fatality of 81.2 per cent.

Recoveries after Intermediary Excision in the Femur.—Two examples are detailed:

CASE 419.—Private J. B. Kendall, Co. K, 5th Wisconsin, aged 34 years, was wounded in the right thigh during the assault on the heights of Fredericksburg, May 3, 1863, and entered Campbell Hospital, Washington, five days afterwards. Surgeon A. F. Sheldon, U. S. V., reported his discharge from service May 3, 1864, by reason of "shot fracture of right femur," and at an examination on July 2, 1866, Surgeon J. H. Baxter, U. S. V., described the man as "suffering from the effects of an excision of nearly five inches of the femur." On November 6, 1867, the pensioner, who then held the appointment of clerk in the Quartermaster General's Office, visited the Army Medical Museum, when the photograph, represented in the annexed cut (FIG. 169), was taken. The following information in regard to his case was elicited from his statements: "He was wounded by a musket ball, which split upon the shaft of the femur, a portion of the missile lodging in the cylinder of the bone and a portion traversing the thigh and making its exit posteriorly. He was conveyed on a stretcher to a house in Fredericksburg, and on the following morning to the Sixth Corps Hospital on Falmouth Heights. On May 10th, he was sent on the cars to Aquia Creek, and thence on a hospital transport to Washington. The injured limb was suspended by Smith's anterior splint. There was intense irritative fever, with copious suppuration. On May 21st, Acting Assistant Surgeon F. W. Kelly made a long incision on the posterior aspect of the thigh, removed a fragment of ball and numerous detached pieces of bone, and turned out and sawed off the sharp extremities of the fractured shaft. The limb was then supported in a wooden trough by cushions. The surgical fever and suppuration gradually abated, and ultimately firm union took place and the wound healed. Abscesses formed several times after his discharge from hospital, and bits of necrosed bone were eliminated. The sinuses did not close definitely until August, 1866." At the time of his visit to the Museum the cicatrices were in a sound condition, and the fracture appeared firmly consolidated, having resulted in two and a half inches shortening of the limb and false anchylosis of the knee. His general health was excellent, and, notwithstanding the stiffness of his knee, he walked briskly with only a slight limp. Owing to the permanent character of the results of the injury this pensioner has been exempted from examinations. The pensioner was paid December 4, 1878.

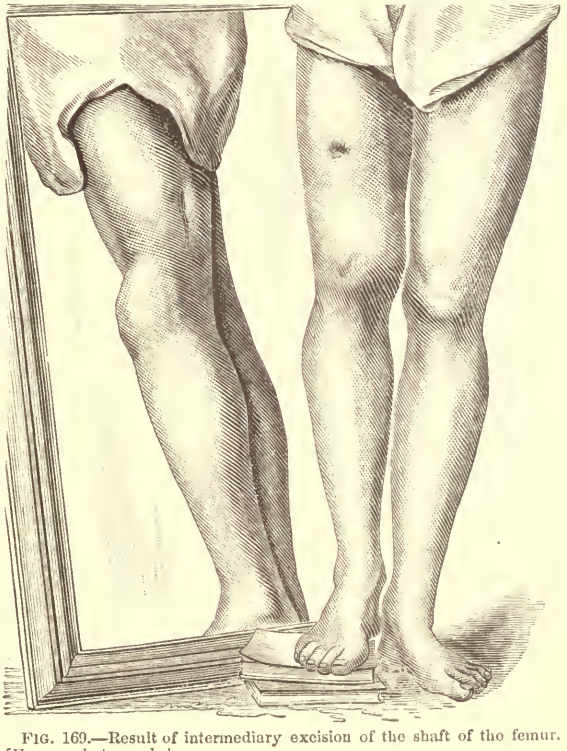

FIG. 169.—Result of intermediary excision of the shaft of the femur. [From a photograph.]

[1] The portion of bone excised amounted to eight inches in one instance (CASE No. 26 of TABLE XXIII); to six inches in two (CASES 16 and 36 of TABLE XXIII); to four inches in eight; to three inches in eight; to two and one-half and to two inches in one each; and in forty-four cases the length of bone excised was not precisely stated. The fractures were caused, in 62 instances, by small projectiles, twice by shell fragments, and once by a grapeshot.

CASE 420.—Private L. M. Baker, Co. B, 2d Wisconsin, aged 29 years, was wounded at Gettysburg, June 1, 1863, and admitted to the field hospital of the 1st division, First Corps. Surgeon G. M. Ramsey, 95th New York, recorded: "Gunshot fracture of right thigh. July 6th, resection." On September 5th, the patient was transferred to Camp Letterman, and subsequently to the General Hospital at York. A photograph, represented in the annexed cut (FIG. 170), was received from Surgeon H. Palmer, U. S. V., with the following description of the case: "A conical leaden ball entered the anterior aspect of the right thigh six inches below the middle of Poupart's ligament, thence passing backward and slightly upward, making its exit at the posterior aspect, an inch above the point of entrance, fracturing the femur. Two hours after the reception of the injury he was taken to a field hospital, and, he states, on the 3d of July he was placed under the influence of chloroform and fragments of bone to the extent of two inches of shaft were removed by cutting down upon them at the seat of the fracture. Water dressings were used for the first two weeks, when Smith's anterior splint was applied—the limb suppurating profusely, and the man's vital power being a good deal depressed. There was a constant tendency to sloughing in the posterior wound, rendering the frequent application of caustic necessary. The splint was removed on the 15th of November, partial bony union having taken place, suppuration still continuing and spiculæ of bone being discharged from time to time; patient, who was upon tonics and nutritious diet, gradually improving. On the 13th of January the posterior wound assumed a sloughing condition, which spread with rapidity, and was attended with considerable constitutional disturbance. It was checked by the free use of bromine, the patient being at the same time upon iron and quinia. Since that time the patient has continued slowly but steadily to improve. April 14th, the wounds have closed; the man is in excellent health and able to walk about on crutches, amount of shortening being two and a half inches. On June 30, 1864, he was discharged from service, although still using crutches, able to bear considerable weight upon the injured limb." Examiner C. D. Cameron, of LaCrosse, Wisconsin, reported, December 23, 1865: "Shot wound of right thigh, shattering the bone. Some four inches of the femur were removed. Limb much crooked and greatly atrophied; is five inches shorter than the other. Wound not yet healed." Examiner W. D. Flinn, of Redwood Falls, Minnesota, September 26, 1873, certified to "resection of about three inches of bone," and stated "the wound has been open and running during the last two and a half years." The pensioner was paid June 4, 1879.

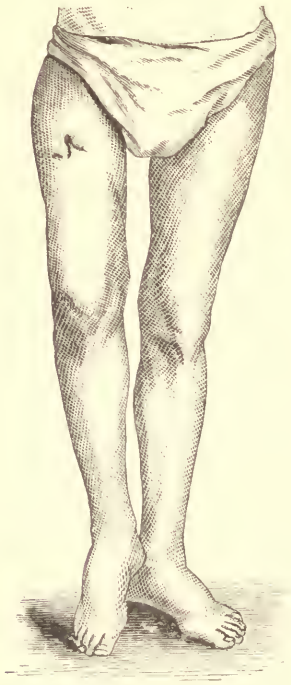

FIG. 170.—Result of intermediary excision in the shaft of the femur. [From a photograph.]

One of the nine survivors after intermediary excision in the shaft of the femur was a Confederate soldier, and eight were Union soldiers. Of the latter, one died nearly a year after the operation, six are pensioners in 1879, and one has not been heard from since 1870. The point of excision was in the upper third of the femur in one instance; in the middle third in five; in the middle and lower in one; and in the lower third in two cases.

TABLE XXV.

Summary of Nine Cases of Recovery after Intermediary Excision of the Shaft of the Femur for Shot Injury.

No.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	INJURY, OPERATION, AND RESULT.	No	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	INJURY, OPERATION, AND RESULT.
1	Anderson, L. C., Pt., A, 7th Kansas Cavalry, age 19.	Nov. 11, 20, '61.	Left; three ins. upper third, by A. A. Surg. J. Thorne; erysipelas. Disch'd March 1, 1864; pens'd; four ins. shortening; anchylosis knee joint.	6	*McFarland, R.*, Pt., K, 22d N. Carolina, age 19.	July 3, 23, '63.	Right; two and a half ins middle third, by A. A. Surg. J. L. Whitaker. Sept. 23, leg paralyzed and two ins. shorten'g. Exch'd April 25, 1864.
2	Baker, L. M., Pt., B, 2d Wisconsin, age 29.	July 1, 6, '63.	Right; two inches middle third; two and a half ins. short'g; Oct. 14, partial union. Disch'd June 30, 1864; pens'd; Sept., '73, w'd has been open two years. *Surg. Phot. Series*, Vol. 4, 1865.	7	Morrison, H. A., Pt., A, 1st Maine Heavy Art., age 20.	May 19, 23, '64.	Right; two and a half ins., and fragm'ts amount'g to three ins. more, middle third, by Surg. N. R. Mosely, U. S. V. Mustered out June 6, 1865; pens'd; not heard from since March, 1870. *Spec.* 2333.
3	Hall, S. C., Pt., F, 3d Indiana Cav., age 18.	Nov. 8, 15, '63.	Right; three and a half ins. up. third, by Surg. T. R. Crosby, U. S. V. April 13, 1864, amp. upper third. Disch'd July 8, 1864; pensioned; stump healed.	8	Whitesell, J., Pt., E, 61st Ohio, age 25.	Aug. 29, Sept. 8, 1862.	Left: four and a half ins. low. and middle thirds, by Surg. B. B. Breed, U. S. V. Disch'd Jan. 17, 1863; pens'd. Died Aug. 12, '63. *Spec.* 199.
4	Hazelrigg, W. G., Pt., A, 19th Inf'ry, age 31.	April 6, —, '62.	Left; lower third. Disch'd Jan. 14, 1863; pens'd; three and a half ins. short'g; pieces of bone dis'd; anch. knee joint.	9	Wilson, J. E., Pt., F, 13th N. Jersey, age 37.	May 3, 17, '63.	Right; fragments, four ins. mid. third, by Surg. W. H. Twiford, 27th Ind. Disch'd April 8, '64; pens'd; four and a half inches short'g; anchy. of knee joint. *Spec.* 1277.
5	Kendall, J. B., Serg't, K, 5th Wisconsin, age 34.	May 3, 21, '63.	Right; three ins. low third, by A. A. Surg. F. W. Kelly. Firmly united. Disch'd May 3, 1864; pens'd; '67, slight limp; two and a half ins. short'g; false anchy. of knee joint. *Surg. Phot.* 187.				

The injuries were inflicted by a grape shot in one case, by a slug in one, and by small missiles in seven instances. The length of the excised portion of the femur varied from two to five and one-half inches.

Fatal Cases of Intermediary Excision in the Shaft of the Femur.—A few illustrations, showing the nature and extent of the intermediary excisions practised, will precede the tabular statement of the thirty-nine fatal cases:

CASE 421.—Private T. Fitzgerald, Co. C, 38th New York, aged 27 years, was wounded at Chancellorsville, May 2, 1863, and treated at a field hospital until June 15th, when he was conveyed to Washington. Assistant Surgeon G. A. Mursick, U. S. V., reported: "The patient was admitted to Stanton Hospital with compound fracture of the lower third of the right femur. Resection of a portion of the bone was performed on May 19th, before admission to this hospital. The wound suppurated profusely, and his condition was unfavorable. Water dressings were used, and Hodgen's splint was applied to the limb. Six ounces of whiskey were administered daily. There was no attempt at union of the bone and no abatement of the discharge. By July 2d the patient had become pale, anæmic, and emaciated, when muriated tincture of iron was prescribed in doses of twenty drops three times a day. The patient was also troubled with anorexia, and on July 5th diarrhœa came on, for which astringents, consisting of opium and tannin, and subsequently tincture of catechu and opium, were administered. Death occurred on July 10, 1863." A section of the injured femur was contributed by Surgeon J. A. Lidell, U. S. V., and is shown in the wood-cut (FIG. 171). The specimen exhibits considerable deposit of callus, imprisoning the necrosed fragments but not uniting the extremities.

FIG. 171.—Section of right femur fractured in lowest third. *Spec.* 1522.

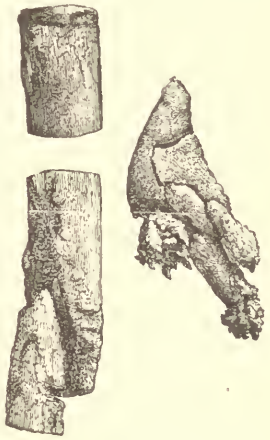

FIG. 172.—Two sections and an irregular portion of shaft of femur. *Spec.* 394.

CASE 422.—Corporal J. White, Co. F, 12th Infantry, aged 16 years, was wounded in the thigh at Gaines's Mills, June 27, 1862. Assistant Surgeon H. S. Schell, U. S. A., reported that the femur was fractured and that the wounded man was captured by the enemy. After remaining a prisoner for three weeks he was exchanged and conveyed to Baltimore. Acting Assistant Surgeon E. G. Waters reported the following history: "The patient was admitted to Camden Street Hospital, July 21st, with the left femur badly shattered at the upper third. No apparatus had been applied. On July 26th, he was placed under the influence of chloroform, and an incision over the seat of injury, six inches in extent and exposing the bone, was made and the broken and unattached fragments removed, after which the ends of the upper and lower extremities were sawn off, leaving a hiatus of some four inches. The wound was then closed by stitches and adhesive strips, and the patient was put upon a supporting treatment. There was considerable loss of blood during the operation, which was performed by Assistant Surgeon R. Bartholow, U. S. A. On August 5th, the limb was placed in the anterior splint. At this time the discharge had improved in appearance and diminished in quantity, and the external wound looked healthy and was closing rapidly; the patient also maintained his strength and cheerfulness, and but for a troublesome bedsore over the sacrum he was almost free from pain. On August 8th, typhoid symptoms came on, the pulse being quick and irritable; the tongue dry, cracked, and covered with brown epithelium; appetite good but thirst insatiable. Wine, quinine, iron, and concentrated nourishment were now administered liberally. The wound was nearly closed and presented a healthy appearance as well as the discharge. On August 14th, colliquative diarrhœa came on, from which the patient sank and died, having survived the operation nineteen days. At the *post-mortem* examination both extremities of the resected portion of the femur were found denuded of periosteum and extensively necrosed. There had been no attempt at union, nor was any callus found in the surrounding tissues. The soft parts were gangrenous and intolerably offensive." The specimen, shown in the wood-cut (FIG. 172), was contributed by the operator, and consists of a portion of the shaft of the injured femur, embracing two sections an inch and a half and three inches long respectively, and an irregular portion two inches by three in its greater lengths. The latter is composed of fragments united by new bone. The larger section is obliquely fractured at one end, with thickened periosteum, and the smaller shows a ring of necrosis at one extremity.

FIG. 173.–Excised five inches of shaft of left femur. Posterior view. *Spec.* 1539.

FIG. 174.–Anterior view of the same specimen.

CASE 423.—Sergeant M. Smith, Co. I, 73d Pennsylvania, was wounded in the left thigh at Chancellorsville, May, 3, 1863. The injury involved a fracture of the femur at the trochanter major. The wounded man reached the Eleventh Corps hospital at Brook's Station on May 15th, and on the following day five inches of the bone, commencing just below the neck, was resected by Surgeon R. Thomain, 29th New York. The patient died June 8, 1863. The excised bone is represented in the wood-cuts (FIGS. 173, 174), and was contributed, with the history, by the operator.

The excision was practised in the upper third in fifteen instances; at the junction of middle and upper thirds in two; in the middle third in fourteen; in the lower third in five instances. In three cases the point of excision was not indicated.

TABLE XXVI.

Summary of Thirty-nine Fatal Cases of Intermediary Excision of the Shaft of the Femur for Shot Injury.

No.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	INJURY, OPERATION, AND RESULT.
1	Atkinson, H. L., Pt., H, 2d Maryland, age 32.	Sept. 30, Oct. 30, 1864.	Right; great trochanter and one inch of shaft. Died Oct. 25, '65; traumatic erysipelas.
2	Baker, J. F., Pt., D, 147th Penn., age 29.	May 3, 18, '63.	Right; two ins., and loose spiculæ. June 10, diarrhœa. Died Aug. 10, 1863.
3	Biddle, A., Pt., E, 6th New Jersey.	May 5, 14, '62.	Left; mid. third, by Surg. R. B. Bontecou, U. S. V. Died May 25, 1862, of pyæmia.
4	Brewer, J., Pt., K, 130th Indiana, age 18.	Aug. 6, Sept. 1, 1864.	Right; three ins. upper third, by Surg. F. Meacham, U. S. V. Died Nov. 18, 1864.
5	Brown, E. W., Lieut., C, 37th New York.	May 5, 16, '62.	Right; three ins. upper third, by Surg. R. B. Bontecou, U. S. V. Died May 23, 1862; pyæmia.
6	*Burden, H.*, Pt., 6th S. Carolina, age 18.	May 5, 17, '62.	Left; by Surg. R. B. Bontecou, U. S. V. Died May 20, '62; pyæm.
7	Burroughs, J., Serg't, B, 3d Kentucky.	Sept. 19, 28, '63.	Right; four ins. low. third; amp. mid. third. Died Oct. 10, 1863.
8	Collar, C., Pt., F, 45th Illinois, age 20.	Feb. 14, Mar. 12, 1864.	Right; mid. third, by Surg. G. S. Kemble, U. S. V. May 1, amp. thigh, upper third. Died May 9, '64. shock.
9	Connover, J. C., Corp'l, E, 27th Illinois, age 21.	May 25, June 18, 1864.	Left; four ins. up. third, by Ass't Surg. G. W. Burke, 46th Penn. Died June 21, 1864; pneumonia.
10	Cramer, J., Pt., E, 55th New York.	May 5, 14, '62.	Five ins. mid. third, by Surg. R. B. Bontecou, U. S. V. Died May 17, 1862.
11	Dickenson, C., Corporal, G, 88th Indiana.	Sept. 20, —, '63.	Right; four inches middle third, by Surg. I. Moses, U.S.V. Died Oct. 5, 1863. *Spec.* 2145.
12	Dillon, W., Pt., A, 10th New York, age 23.	June 3, 13, '64.	Right; six ins. up. third, by Surg. A. F. Sheldon, U. S. V. Died June 13, 1864, shock.
13	Eisele, R., Pt., E, 6th New Jersey.	May 5, 17, '62.	Left; four ins. middle third, by Surg. R. B. Bontecou, U. S. V. Died May 20, 1862; pyæmia.
14	Fitzgerald, P., Pt., I, 38th New York, age 27.	May 2, 19, '63.	Right; low. third. July 5, diarrh. Died July 10, 1863, suppuration and diarrhœa. *Spec.* 1522.
15	*Friend, J.*, Pt., H, 7th Missouri, age 27.	July 4, 13, '63.	Right; mid. third, by A. A. Surg. A. Sterling. Died July 17, 1863; hæmorrhage. *Spec.* 2091.
16	*Goddard, W.*, ——, B, Caswell's Georgia S. S.	June 24, J'y 1, '63.	Middle third; erysipelas. Died August 24, 1863.
17	Hall, J. W., Pt., I, 92d New York.	Dec. 14, 29, '62.	Left; three and a half ins. up. t'd, by Surg. C. A. Cowgill, U. S. V. Died Jan. 22, 1863. Autopsy. *Spec.* 1328.
18	Hall, S. M., Pt., E, 7th New York, age 29.	June 3, 13, '64.	Left; five ins. up. third, by Surg. A. F. Sheldon, U. S. V. Died June 17, 1864, exhaustion.
19	Hamlin, J. L., Corp'l, G, 7th Minnesota, age 21.	Dec. 16, 23, '64.	Left; two and a half ins. upper third, by A. A. Surg. S. Blackwood. Died Dec. 24, '64; shock of operation.
20	Harper, C. D., Pt., F, 5th Michigan.	May 5, 14, '62.	Left; four ins. mid. th'd, by Surg. R. B. Bontecou, U. S. V. Died May 17, 1862; pyæmic hæmor. from wounded veins of thigh.
21	Heller, J. P., Pt., F, 147th Pennsylvania.	May 3, 19, '63.	Right; three ins. Died May 25, 1863, tetanus. *Spec.* 1272.
22	Horrigan, D., Pt., K, 28th Mass., age 32.	May 5, 30, '64.	Left; four ins. up. third, by Surg. A. F. Sheldon, U. S. V. Died Sept. 2, 1864, of wounds.
23	Huntley, H. S., Pt., I, 37th New York.	May 5, 17, '62.	Left; lower third, by Surg. R. B. Bontecou, U. S. V. Died May 22, 1862; pyæmia.
24	Lemberger, F., Pt., I, 33d Iowa, age 23.	July 4, 17, '63.	Right; nineteen fragm. and sharp ends, four ins. in all, lower third, by Surg. I. Moses, U.S.V. Died July 26, 1863, of inflammatory fever. *Spec.* 2084.
25	Martin, F., Serg't, F, 155th Penn., age 22.	May 8, June 1, 1864.	Left; middle third, by Surg. A. F. Sheldon, U. S. V.; gangrene. Died June 7, 1864; exhaustion.
26	May, A. S., Pt., E, 8th Iowa, age 26.	April 9, May 5, 1864.	Right; three ins. up. third. Died May 6, 1864.
27	McCormick, R., Serg't, C, 2d Missouri, age 24.	Sept. 20, Oct. 18, 1863.	Left; frag. and ends, three and a half ins., mid. third, by Surg. I. Moses, U. S. V. Nov. 3, arterial hæm. Died Nov. 11, 1863, of pyæmia. Autopsy. *Spec.* 2131.
28	P——, ...	Intermediary, 1862.	Right; low. third, by Surg. B. A. Vanderkieft, 102d N. Y. Died in three weeks; pyæmia. *Spec.* 11.
29	Parker, T., Pt., I, 5th New Jersey, age 20.	May 5, 15, '62.	Right; three ins. mid. third, by Surg. R. B. Bontecou, U. S. V. Large bed-sores. Died July 2, 1862; diarrhœa.
30	Paton, T., Pt., E, 72d New York.	May 7, 17, '62.	Left; up. port. protruding femur, by Surg. R. B. Bontecou, U.S.V. Died May 20, 1862, of pyæmia.
31	Polser, J. P., Pt., B, 15th Iowa.	Oct. 4, 25, '62.	Left; upper third. Died Oct. 27, 1862.
32	Redwood, W., Pt., A, 5th Michigan.	May 5, 16, '62.	Left; five ins. mid. third, by Surg. R. B. Bontecou. Died May 19, 1862.
33	Rose, S. L., Serg't, D, 113th Ohio.	Sept. 20, Oct. 17, 1863.	Right; ends and frag., two and a half ins. in all, middle third, by Surg. I. Moses, U. S. V. Died Oct 20, 1863. *Spec.* 2130.
34	Sayre, A., Pt., E, 12th Ohio.	Dec. 11, 26, '63.	Left; troch. major. Died January 23, 1864; pyæmia.
35	Smith, I. M., Serg't, I, 73d Pennsylvania.	May 3, 16, '63.	Right; five ins. up. third, includ'g troc. major, by Surg. R. Thomaine, 29th New York. Died June 8, '63; anæmia. *Spec.* 1539.
36	Stevens, H., Pt., I, 59th Mass., age 16.	May 6, June 3, 1864.	Right; three ins. upper third, by Surg. R. B. Bontecou, U. S. V. Died June 5, '64; exhaustion. *Spec.* 3034.
37	Taylor, C. H., Pt., E, 3d Artillery, age 20.	Feb. 20, Mar. 6, 1864.	Right; mid. third, five ins., by Ass't Surgeon W. R. Ramsay, U. S. A., and others. Died April 2, 1864; exhaustion from continued hæmorrhage.
38	White, J., Corp'l, F, 12th Infantry.	June 27, July 26, 1862.	Left; three ins. up. third, by Ass't Surg. R. Bartholow, U. S. A. Died Aug. 14, 1862. Autopsy; gangrene. *Spec.* 394.
39	Young, W., Serg't, C, 5th Minnesota, age 28.	Dec. 16, 23, '64.	Left; three and a half ins. upper third, by A. A. Surg. S. Blackwood. Died Dec. 31, 1864.

Three of these thirty-nine soldiers belonged to the Confederate and thirty-six to the Union army. The right femur was injured in nineteen, the left in eighteen of the thirty-seven cases in which this point was recorded.

Secondary Excisions in the Shaft of the Femur.—Nineteen examples were reported in this category. Fifteen patients recovered, three died, and the result in one instance remains undetermined.

Recoveries after Secondary Excision in the Shaft of the Femur.—Two examples of the fifteen cases of this group will be given in detail:

CASE 424.—Private J. Reid, Co. G, 162d New York, aged 35 years, was wounded in the right thigh, at Springfield Landing, June, 1863. Assistant Surgeon J. Homans, jr., U. S. A., recorded his admission to St. James Hospital, New Orleans, July 3d, and described the injury as follows: "The patient had sustained a compound fracture of the right femur a few days previous to entering the hospital, having been wounded by a bullet, which entered the anterior face of the limb about four and a half inches below Poupart's ligament, and emerged about four inches below the great trochanter, having passed just outside

the femoral artery and shattered the bone in its passage. On admission the thigh was but slightly swollen; the shortening amounted to about an inch and a half. I determined to make an effort to save the limb, for experience had taught me how much conservative surgery can accomplish in gunshot fractures of the thigh. A Smith's anterior splint was applied, but, proving uncomfortable, it was removed and the limb was placed on a double-inclined plane. The orifice of entrance healed, and pus, which began to be discharged quite freely, flowed out through the lower opening. On July 29th the patient's condition was favorable for an operation, and I determined to remove all the necrosed bone possible, and, if necessary, to resect a portion of the shaft of the femur. The patient was placed under the influence of chloroform, and an incision two and a half inches long was made from either side of the orifice of exit in the direction of the long axis of the limb. Several pieces of necrosed bone were then removed, and the end of each fragment of the fractured femur was turned out and sawn off with a chain saw beyond the point where the bone was bare. The periosteum along the course of linea aspera was carefully preserved and peeled off from the bone, or rather the bone was gently torn away from the periosteum. About three inches of the femur were thus resected. No untoward symptom followed for more than two months, and, in October, the limb could be raised by the heel, union being quite firm. About this time he was attacked with erysipelas, which seemed to be caused by the whitewashing of the ward in which he lay; but the attack was slight and soon passed off. In November he could walk about on crutches and bend his knee slightly. I noticed that union took place first and mainly along the inner side of the bone; and as the periosteum here was preserved entire, there was not so much shortening as would otherwise have resulted, it being only three and a half inches. On December 12, 1863, the patient was discharged from service and left for New York. How useful a limb he will have cannot yet be determined, but amputation would have killed him." The New York City Examining Board, at different dates, certified to the injury, and to union with deformity, and from four and a half inches to five inches shortening as resulting therefrom, together with complete anchylosis of the knee joint. The pensioner is also reported as wearing an artificial appliance attached to his shoe. The pensioner was paid March 4, 1879.

CASE 425.—Private J. F. Williams, Co. H, 26th Pennsylvania, aged 25 years, was wounded in the right shoulder and right thigh, at Gettysburg, July 2, 1863. He entered a field hospital of the Third Corps, and was removed to Camp Letterman one month afterwards. Surgeon H. Janes, U. S. V., noted the injury as "a compound fracture of the right femur at the upper third, caused by a minié ball," and recorded the following result: "On September 8th, the upper extremity of the lower fragment was found to be protruding and to be denuded, and four days later the patient was placed upon the operating table and about two inches of the lower fragment were carefully excised by Acting Assistant Surgeon H. Leaman. The limb was then placed in an anterior splint. Small pieces of bone were discharged from time to time and steady improvement followed. By November 9th, partial union had taken place, and several days afterwards the patient was transferred to York Hospital." Surgeon H. Palmer, U. S. V., in charge of the latter, on February 15, 1864, made the following note of the condition of the limb: "At this time there is complete bony union of the fracture. There is, however, some dead bone at the upper fourth of the thigh, still causing rather free discharge of pus by three openings. The thigh is shortened about four and a half inches, its circumference increased four inches, and the limb bent outward. The patient's general health is excellent and his constitutional condition good." The patient was ultimately transferred to Mower Hospital, Philadelphia, July 25, 1865, and one month later he was discharged and pensioned. Examiner E. A. Smith, of Philadelphia, on August 28, 1865, certified to "total loss of use of right arm and right leg from wound of shoulder and thigh, to fracture of femur and eight inches shortening," and to "one hundred and twenty-nine pieces of bone having been removed," and added that the pensioner "has a cough and is a sad wreck." The pensioner was paid March 4, 1866, since when he has not been heard from.

The excision was practised in the upper third in nine instances, in the middle third in four, and in the lower third in two. In four cases portions of the trochanter major and of the shaft of the femur were excised; in the remaining eleven cases the excised portion of the femur varied in length from two to six inches.

Fatal Cases of Secondary Excision in the Shaft of the Femur.—The three operations of this group were practised on Union soldiers. In one instance the right femur, and in two the left femur had been fractured.

CASE 426.—Private J. McElroy, Co. E, 35th Iowa, aged 38 years, was wounded in the right thigh, at Lake Chicot, June 6, 1864, and underwent the operation of resection of the femur at Gayosa Hospital, Memphis. Surgeon F. N. Burke, U. S. V., who performed the operation, made the following report of the case: "The patient was admitted twelve days after the injury, which was caused by a minié ball striking the anterior surface of the middle third of the thigh, fracturing the femur, and lodging in the limb. The leg was placed in a double-inclined concave splint. The wound healed readily without suppuration, and in two months the patient was able to walk on crutches, the fragments—though not in a straight position—having united partly by cartilage and partly by ligament. His constitutional state was very good, he being fat and healthy. The patient was to have been sent to his home on furlough, but on October 25th, having been allowed to go out on the street, he became intoxicated, and, by a fall, refractured the femur at the place of union. On the following day he was placed under the influence of chloroform, and three inches of bone was excised through an incision five inches in length, an opening one inch long being made on the posterior surface of the thigh for drainage. Bilious diarrhœa set in five days after the operation and continued for two weeks. Death resulted from pyæmia, November 23, 1864, several violent chills having occurred five or six days before and much prostration during two weeks. Large quantities of stimulants, together with quinine and iron, and nourishing diet were administered, and solution of chlorinate of soda was applied to the wound. The *post-mortem* examination revealed a large abscess extending from the wound to the hip joint and containing laudable pus in considerable quantity. There was no sign of any reparative process in the ends of the bone, and no pus was found in the lungs, liver, or spleen."

TABLE XXVII.

Summary of Nineteen Cases of Secondary Excision in the Shaft of the Femur for Shot Injury.

[Recoveries, 1—15; Deaths, 16—18; Result undetermined, 19.]

No.	Name, Military Description, and Age.	Dates.	Injury, Operation, and Result.	No.	Name, Military Description, and Age.	Dates.	Injury, Operation, and Result.
1	Allen, J. W., Pt., B, 22d Indiana, age 28.	Oct. 8, Dec. 1, 1862.	Left; three ins. lower third, by Surg. J. G. Hatchitt, U. S. V. Anæmia. Disch'd Feb. 13, 1863; pens'd; six inches shortening.	11	O'Riley, P., Pt., H, 69th New York.	Sept. 17, Oct. 22, 1862.	Left: carious and necrosed trochanter major and shaft. Discharged Mar. 10, 1863; not pensioned.
2	Curtin, D., Pt., G, 47th New York, age 25.	Feb. 20, July 15, 1864.	Left; four in. mid. third. Disch'd June 5, 1865; pens'd; lig. union only; knee joint anchylosed; shortening over seven inches.	12	[1]Reid, J., Pt., G, 162d New York, age 35.	June 8, July 29, 1863.	Right; necrosis; three ins. upper third, by Ass't Surg. J. Homans, jr., U.S.A.; Oct., '63, union firm; erysip. Disch'd Dec. 12, 1863; pens'd; union with deformity; anchylosis knee joint.
3	Dennell, W. I., Serg't, E, 73d Penn., age 23.	July 20, Aug. 23, 1864.	Left; troch. maj. and two inches necrosed shaft, by A. A. Surg. M. L. Herr. Duty Jan. 10, 1865; not pensioned.	13	Thomas, W. C., Pt., F, 55th Ohio, age 17.	May 2, Sept. 11, 1863.	Right: July 11, rem. seq.; ex. of four ins. up. third. Disch'd June 27, 1864; pens'd; great deform. and short'g. *Spec.* 1686.
4	Duggan, T., Corp'l, M, 11th Illinois Cavalry, age 19.	Dec. 18, '62. Aug. 23, '63.	Right; lower third: gangrene. Disch'd April 7, '65; pensioned. July 5, 1866, amputation, junct. lower and middle thirds.	14	Watts, S., Serg't, K, 33d Ohio, age 21.	May 14, 1864.	Right; two ins low. thirds. Dis'd June 6, '65; pens'd; shortening six ins., leg useless.
5	Frazee, H. W., Pt., L, 2d New York Heavy Artillery, age 29.	Apl 7, '65, April —, 1866.	Left; two ins. upper thirds, by Dr. Hutchinson; ends wired. Dis'd Jan. 10, '66, befo. operat'n; pens'd; no union, limb no use.	15	Williams, J. F., Pt., H, 26th Penn., age 25.	——— July 2. Sept. 12, 1863.	Right; two inches upper third, by A. A. Surgeon H. Leaman. Nov., '63, partial union. Must. out Aug. 26, '65; pens'd; eight inches shortening.
6	*Grayson, C.*, Pt., F, 16th Mississippi.	Sept. 17, Dec. 22, 1862.	R't; necro.: portion of troch. maj. and shaft, by A. A. Surg. A. V. Cherbonnier. Duty April 27, '63.	16	Chase, J. A., Pt., B, 12th Mass., age 36.	Dec. 13, 1862, Jan. 13, 1863.	Left; fragm'ts and sharp points, two ins. in all, by A. A. Surg. R. Reyburn. Jan. 18, 19, hæmorrhage from external circumflex artery. Died Jan. 19, 1863. *Spec.* 1021.
7	Haggerty, D., Pt., L, 1st New Jersey Cav., age 23.	Oct. 12. 1863, ———	Left: necrosis troch.; exc. disens'd portion, by A. A. Surg. J. H. Thompson. Must. out Sept. 22, 1864; applied for pension Dec., 1864, not heard from since.	17	[2]McElroy, J., Pt., E, 35th Iowa, age 38.	June 6, Oct. 26, 1864.	Right; bone united; refract. by fall; three ins. mid. third. Surg. F. N. Burke, U.S.V. Died Nov. 23, 1864, pyæmia. Autopsy.
8	*Hosay, J.*, Pt., B, 9th Missouri.	July 4, '63, Mar. 8, '64.	Left; three ins. mid. third, by A. A. Surg. A. Sterling. Prison, Nov. 4, 1864.	18	[3]Unknown, Pt., — New Jersey, age 22.	June 27, Aug. 10, 1862.	Left; five and a quarter inches mid. third, 28 pieces, by Dr. — Merritt. Died Aug. 10, 1862.
9	Houghton, D. F., Corp'l, E, 16th Maine, age 21.	Dec. 13, '62, Aug. 6, '63.	Left; caries; six ins. up. third, by Surg. C. Alexander, 16th Maine. Disch'd May 15, 1863, pens'd; shorten'g six ins., stiff, open.	19	Unknown.....	———, 1862.	——. Excis'n of frag't, and small portion of shaft partly necrosed. Result unknown. *Spec.* 396.
10	Millhouse, J., Serg't, K, 73d Illinois, age 31.	Sept. 20, Dec. —, 1863.	Left; two and a half ins. middle third. Disch'd April 30, 1865; pens'd; bone carious, very lame.				

Excisions in the Shaft of the Femur at an Unknown Period after Shot Injury.—The seventeen cases of this group are enumerated in the following table:

TABLE XXVIII.

Seventeen Cases of Excision in the Shaft of the Femur after Shot Injury; time of Operation not known.

[Recoveries, 1—7; Deaths, 8—16; Result unknown, 17.]

No.	Name, Military Description, and Age.	Dates.	Operations, Operators, Result.	No.	Name, Military Description, and Age.	Dates.	Operations, Operators, Result.
1	Grauaz, F., Pt., D, 1st Penn. Rifles, age 38.	Dec. 13, '62, ——.	Left; two ins. mid. third. Dis'd Aug. 20, 1863; subsequently enlisted in V. R. C. Dis'd June 4, '65, and pens'd; union complete. Not heard from since Mar. 4, '68.	8	*Baker, R.*, Lieut., A, 9th Mississippi, age —.	Nov. 25, '63, ——.	Left; three ins. and small fragments middle third; diarrhœa. Died Jan. 2, '64; pyæm. Autop.
2	Hiatt, H. H., Pt., B, 19th Indiana, age 19.	Aug. 31, '62, ——.	Right; three ins. Disch'd Oct. 20, '63; pens'd. Atrophy; three ins. short'g; anchy. of knee and hip joints. Died Mar. 21, '71; general debility and prostration.	9	Bartholomew, G., Pt., E, 8th Missouri, age —.	May 8, '62, ——.	Right; fractured parts mid. third, by Surg. D. W. Hartshorne, U. S. V. Died May 20, 1862.
3	Holbrook, S., Pt., 1st N. H. Battery, age 22.	Dec. 13, '62, ——.	Right; up. third. Disch'd Dec. 17, '63; pens'd: bone discharging; can do light work.	10	Bowman, W. H., Pt., I, 78th Illinois, age —.	Nov. 24, '63, ——.	Left; lower third, ends sawn off; pyæmia. Died Dec. 22, 1863.
4	Murphy, E. A., Serg't, C, 2d New York Mt'd Rifles, age 23.	Mar. 31, '65, ——.	Left; two ins. middle third; ball extracted. Disch'd Oct. 11, '65; pens'd; short'g three and a half ins.; anchy. knee joint; necrosis.	11	Furgerson, N., Pt., G, 6th Indiana, age —.	Nov. 23, '63, ——.	Right; low. third, ends sawn off. Died Jan. 18, 1864; exhaustion. Autopsy.
5	Nelson, J., Pt., H, 51st Ohio, age 21.	Sept. 3, '64, ——.	Right; two ins. one side of upper third; gang., car., necro. Dis'h July 29, '65; pens'd; bone diseased; one and a half ins. short'g; anchy. of knee joint.	12	*McHarper, P.*, Pt., H, 12th Miss., age —.	———	Left. Died June 6, 1864.
6	*Shannon, A. J.*, Pt., F, 35th N. C., age 33.	April 20, '64, ——.	Left. Retired February 9, 1865; limb entirely useless.	13	[4]Maines, R., Pt., F, 70th New York, age 30.	May 5, '62, ——.	Left. Died May 31, 1862.
7	*Woolton, A.*, Pt., A, 15th Alabama, age 26.	Aug. 28, '62, ——.	Right; lower third. Retired Jan. 4, 1865; shortening 2½ inches.	14	*Thompson, J. S.*, Pt., H, 11th Tenn., age —.	Nov. 24, '63, ——.	Right; middle third, rough ends sawn off. Jan. 14, 1864, hæm. from profunda art'y. Died Jan. 19, 1874. Autopsy.
				15	Woolf, T., Pt., A, 125th Pennsylvania, age —.	Sept. 17, '62, ——.	Left. Died Jan. 25, 1863.
				16	Vocum, J. P., Pt., A, 89th Illinois, age —.	Nov. 24, '63, ——.	Left; upper third, ends sawn off. Dec. 19, pyæmia. Died Dec. 20, 1863. Autopsy.
				17	*Debuck, J.*, Pt., C, 29th Tennessee, age —.	——— Je. 1, '64.	Right; three ins., including trochanter major. Result unknown.

[1] HOMANS (J., jr.), *Resection of Three Inches of the Upper Third of Femur*, in *Am. Med. Times*, 1864, Vol. VIII, p. 65.

[2] DORRAN (W. M.), *Two Cases of Gunshot Fract. of Upper Third of Femur, Treated Conservatively*, in *Med. Record*, 1866-67, Vol. I. Case II. p. 467.

[3] MERRITT (—), *Compound Comminuted Fracture of Femur—Exsection*, in *Am. Med. Times*, 1863, Vol. VI, p. 247.

[4] PRAY (G. M.), *Reports of Hospitals*, in *Am. Med. Times*, 1862, Vol. V, Case III, p. 76.

The seventeen cases in which the time between the reception of the injury and the operation could not be ascertained comprise eleven Union and six Confederate soldiers. In eleven instances the length of the excised portion of the femur was not indicated; in three instances two inches, and in three, three inches of bone were removed.

Summing up the one hundred and seventy-five cases of excision in the shaft of the femur, it will be seen that the operations were performed in the upper third in seventy-six instances, including nine cases in which the operation extended into the middle third of the femur. Of these seventy-six cases twenty-five recovered, forty-nine proved fatal, and in two the result remained undetermined, a mortality of 66.2 per cent. Of the fifty-nine excisions in the middle third of the femur, the final issue could not be ascertained in one case; eighteen were followed by recovery, and forty by death, a death rate of 68.9 per cent. The seventeen operations in the lower third include five recoveries, eleven deaths, and one undetermined result, a fatality of 68.7 per cent. The twenty-three operations with undefined seat of fracture include sixteen deaths, three recoveries, and four undetermined cases, a mortality of 84.2 per cent. In six of the one hundred and seventy-five cases of excision in the shaft of the femur recourse was had to subsequent amputation of the thigh, and in one, to exarticulation at the hip.[1] Further observations on excisions in the shaft of the femur will be reserved for the concluding remarks of this section.

AMPUTATIONS IN THE SHAFT OF THE FEMUR.—On page 169, *ante*, the total number of cases of amputations of the thigh to be considered in this section was stated as 6,238. Of these, 9 were performed for shot contusions of the femur, 2,900 on account of shot fractures of the shaft of the femur, and 3,329 for immediate or remote results of shot fractures of the knee joint, leg, ankle joint, or foot. The nine operations for complications following shot contusions of the shaft of the femur have been detailed at page 173, and there remain to be noticed 6,229 cases as indicated in the following table:[2]

[1] The cases of excision in the shaft of the femur followed by amputation of the thigh are: Private J. Becht, B, 7th Maryland, fatal (CASE 3, TABLE XXIII, p. 206); Corporal J. W. Soule, D, 6th Michigan Cavalry, fatal (CASE 418, p. 205, and CASE 51, TABLE XXIII, p. 206); Private S. C. Hall, F, 3d Indiana Cavalry, recovery (CASE 3, TABLE XXV, p. 208); Sergeant J. Burroughs, B, 3d Kentucky, fatal (CASE 7, TABLE XXVI, p. 210); Private C. Collar, F, 45th Illinois, fatal (CASE 8, TABLE XXVI, p. 210); and Corp'l T. Duggan, M, 11th Illinois Cavalry, recovery (CASE 4, TABLE XXVII, p. 212). In the case of L. Carroll, H, 1st Delaware (CASE 298, p. 139, and CASE 11, in TABLE XXIII, p. 206), the excision in the shaft of the femur was followed by an unsuccessful exarticulation at the hip.

[2] Adding to the 6,229 cases recorded in this Table the 9 cases of amputation in the thigh following shot contusions of the femur, the 2 operations cited at page 8, *ante*, for complications following deep incised wounds, and the 131 amputations tabulated at page 54, *ante*, following shot flesh wounds of the lower extremity, we have a total of 6,371 recorded cases of amputation of the thigh performed for injuries inflicted by weapons of war in the American civil war.

As indicated in the Table, the result as to fatality remained undetermined in only eighty of the six thousand two hundred and twenty-nine cases; twenty-eight hundred and thirty-nine were followed by recovery, and three thousand three hundred and ten by death, a mortality of 53.8 per cent. This exceeds the fatality in cases of shot fractures of the femur treated by conservation (49.9 per cent., see page 176, *ante*) by 3.9 per cent., while it is 15.6 per cent. less than the ratio of deaths after excisions in the shaft of the femur (69.4 per cent., see page 200, *ante*). It will also be observed that of the amputations in which the time between the injury and the operation could be definitely ascertained, the primary are by far the most numerous. The sixty-two hundred and twenty-nine amputations were performed on sixty-two hundred and nine patients, twenty being double operations. In three cases both thighs were removed at the middle thirds; ten ablations of both thighs were performed in the lower thirds; in one case the point of amputation in the right thigh was not stated, while the left thigh was amputated in the lower third, and in six instances of amputation of both thighs the thirds were not indicated.[1] In fourteen of the twenty double thigh amputations both operations were primary; in two, both intermediary; in one, the operation in the right thigh was a primary, and in the left thigh an intermediary; in one, the amputation in the right thigh was a primary, and in the left thigh a secondary; and in two instances the periods of the operations were not recorded. In twelve cases the ablation in the thigh was accompanied by an amputation of the opposite limb, viz: in three, by amputations at the knee joint; in eight, by amputations in the leg; and in one, by an amputation at the ankle joint.[2]

PRIMARY AMPUTATIONS IN THE SHAFT OF THE FEMUR FOR SHOT INJURY.—According to the plan indicated on p. 697 of the *Second Surgical Volume*, the cases in which the operation was practised within forty-eight hours subsequent to the reception of the injury have been classified as primary amputations. Three thousand nine hundred and forty-nine of the six thousand two hundred and twenty-nine amputations in the shaft of the femur belong to this group. In forty-eight instances the results were not ascertained; nineteen hundred and fifty-eight were successful, and nineteen hundred and forty-three were fatal, a mortality of 49.8 per cent.

Primary Amputations in the Upper Third of the Femur.—Five hundred and thirty-three of the thirty-nine hundred and forty-nine primary amputations in the shaft of the

[1] The three instances in which both thighs were removed in the middle thirds are: Sergeant T. Doud, 2d Michigan, primary operations, fatal; Corporal J. W. Woodworth, H, 11th Michigan, primary operations, fatal; Private S. Bagley, B, 5th New Hampshire, right, primary, left, secondary operation, fatal (*Spec.* 4232, A. M. M.). The ten instances of ablations of both thighs in the lower thirds are: Corporal M. Dunn, H, 46th Pennsylvania, primary operations, recovery (*Spec.* 3193, A. M. M.); Private *E. G. Rush*, 21st Georgia, primary operations, recovery (see *Surg. Phot. Series*, Nos. 132, 133, and *Cont'd Photo's*, Vol. 3, p. 36, and *Spec.* 3998, A. M. M.); Private S. Allen, G, 59th Massachusetts, primary operations, fatal; Private R. S. Michael, A, 105th Pennsylvania, primary operations, fatal; Private D. Nicholson, H, 22d Massachusetts, primary operations, fatal (*Spec.* 2966, A. M. M.); Sergeant E. C. Rabbit, B, 10th Missouri, primary operations, fatal; Private J. Stewart, D, 77th New York, primary operations, fatal; Lieutenant J. Whelpley, D, 1st Maine, primary operations, fatal; Private D. Wallace, I, 5th Artillery, intermediary operations, fatal (*Specs.* 1383, 1384, A. M. M.); Pt. J. Moore, E, 46th Pennsylvania, intermediary operations, fatal. In the fatal case of Private W. F. Mills, E, 8th New York Heavy Artillery, the point of the primary amputation in the right thigh was not recorded, the operation in the lower third of the left thigh was an intermediary. The six instances in which the points of ablation were not stated are: Pt. S. Goodwell, G, 29th Illinois, primary operations, fatal; Pt. *H. Kenner*, 4th Virginia, primary operations, fatal; Pt. C. Myer, F, 30th Missouri, primary operations, fatal; Pt. H. Tieman, C, 119th New York, primary operations, fatal; Pt. *J. A. Parker*, L, Cobb's Legion Cavalry, time of operations not stated, recovery; Pt. *G. Nunenger*, A, 58th Virginia, time of operations not stated, fatal.

[2] The three cases of amputation of the thigh and of exarticulation at the knee of the opposite limb are: Corporal C. N. Lapham, K, 1st Vermont Cavalry, amputation of right thigh in middle third and of left leg at the knee joint, primary operations, recovery (see *Surg. Photo's Series*, Nos. 154, 155); Private J. Barker, I, 58th Massachusetts, amputation of right thigh in lower third and of left leg at knee joint, primary operations, fatal; Private H. Smith, I, 14th New Jersey, amputation of right thigh in lower third and of left leg at the knee joint, primary operations, fatal. The eight cases of amputations in the thigh and ablations of the opposite leg are: Private S. Banks, C, 43d Colored Troops, primary amputations in middle third of right thigh and lower third of left leg, fatal; Private L. Johnson, B, 1st Tennessee, primary amputations of left thigh in lower, and right leg in upper third, fatal; Private L. O. Lamphere, G, 21st Connecticut, Sergeant P. Bradley, C, 16th Michigan, and Private *J. R. Lewis*, H, 53d Georgia, primary amputations in left thighs in lower thirds and of right legs in lower thirds, fatal; Sergeant J. Foss, C, 59th New York, primary amputations of thigh and leg, thirds unknown; H. Housley, F, 32d Wisconsin, amputation of right thigh in lower third and of left leg in upper third, intermediary operations, recovery; Private H. Brown, K, 22d Colored Troops, primary amputation of right leg in upper third, and secondary amputation of left thigh in lower third, recovery; Lieut. A. Birmingham, A, 69th New York, primary amputation of right thigh in lower third and of left foot at ankle joint, fatal.

femur were practised in the upper third of the thigh. The result was determined in all but five cases. Two hundred and sixty patients recovered after the operation, and two hundred and sixty-eight, or 50.7 per cent., died. The right thigh was amputated in two hundred and forty-nine, and the left in two hundred and thirty of the four hundred and seventy-nine instances in which this point was recorded. A few successful and fatal examples will be detailed, and all cases of primary amputation in the upper third of the thigh will be enumerated in TABLE XXX.

Successful Cases of Primary Amputations in the Upper Third of the Thigh.—The two hundred and sixty operations of this category were performed on two hundred Union and on sixty Confederate soldiers. It was impracticable to ascertain the subsequent histories of the Confederate soldiers. Of the Union soldiers, one officer was retired and one hundred and ninety-nine men were pensioned, and it appears from the records of the Pension Office that one hundred and ninety-three of the survivors after primary amputation in the upper third of the femur were living in September, 1879. One had died from chronic diarrhœa, two from consumption, the result of the injury and the operation, and in four cases the cause of death was not reported:

CASE 427.—Lieutenant-Colonel R. Avery, 102d New York, aged 24 years, received a shot fracture of the upper third of the right thigh, at Lookout Mountain, November 24, 1863. He entered the field hospital of the 2d division, Twelfth Corps, where the injured limb was amputated by Surgeon C. H. Lord, 102d New York, who reported as follows: "This case of amputation at the upper third of the thigh is of interest from the fact that the patient had recently returned to duty from hospital, where he had been since receiving a severe wound of the face and neck at Chancellorsville, May 3, 1863. His general health was poor, yet he underwent the operation well, and at the date of this report, December 2d, he is getting along finely. The flap has closed completely for nearly two inches anteriorly, and every indication points to a speedy recovery. Dry dressings have been used entirely." The patient was subsequently transferred to hospital at Bridgeport, and afterwards to Nashville, whence he proceeded to his home on leave of absence. Lastly he entered the Annapolis Hospital, and on June 27, 1864, he was discharged from service. In the following year he was re-appointed as an officer of the Veteran Reserve Corps, and on December 31, 1870, he was retired from active service. In a communication from Dr. H. E. Goodman, late surgeon U. S. V., the amputation was described as having been performed "at the great trochanter." During January, 1866, Colonel Avery, who was then serving on duty at the office of the Commissary General of Prisoners, visited the Army Medical Museum, being quite well and in good health, and the stump, though affected with neuralgia, having been healed for more than a year previous. This officer's name appears on the retired list in 1879.

CASE 428.—Private T. E. Gay, Co. H, 9th Ohio Cavalry, aged 19 years, was shot in the left thigh while on guard duty, at Cypress Creek, April 22, 1864. The nature of the injury was reported by Surgeon C. M. Finch, of the regiment, as follows: "The wound was the result of an accident, the missile, a carbine ball, entering the knee joint at the external condyle, passing upward and comminuting the femur to the upper third, at which point the limb was amputated. From present indications (eight days after the accident) the man will recover." One month after the reception of the injury the patient was transferred to hospital at Nashville, subsequently to Louisville, and lastly to Camp Dennison. Surgeon C. McDermont, U. S. V., in charge of the latter hospital, reported that "the patient was admitted June 21st in good general health, but in his transfer he sustained a severe contusion of the stump by a fall. On the following day the stump presented a gangrenous appearance, which was checked by the application of a solution of bromine. Subsequently dressing of basilicon ointment was applied, under which it rapidly improved and threw out healthy granulations." The patient was furnished with an artificial limb, seven months after the reception of the injury, by the firm of Douglas Bly, and on November 17, 1864, he was discharged from service and pensioned. In his application for commutation, in 1870, the pensioner mentions that Assistant Surgeon John C. Thorpe, 9th Ohio Cavalry, performed the amputation. Examiner J. W. Long, of Bryan, Ohio, May 7, 1873, certified to "amputation of left leg four inches below the upper point of the trochanter major; muscles very much atrophied, the bone being covered by nothing but the skin and fascia up to the trochanter. He has no power in the stump, etc." The pensioner was paid September 4, 1879.

CASE 429.—Private J. H. Judd, Co. C, 86th New York, aged 18 years, was wounded in the right thigh, before Petersburg, September 11, 1864. He was admitted to the field hospital of the 3d division, Second Corps, whence Surgeon J. S. Jameson, 86th New York, described the injury as "a compound fracture of the femur at the middle third, caused by a musket ball," and reported that he "amputated the limb at the upper third." The patient was subsequently transferred to City Point, and three weeks after the date of the operation he was moved to hospital at Alexandria, whence Surgeon E. Bentley, U. S. V., described the amputation as an "antero-posterior flap operation." The patient was ultimately transferred to Judiciary Square Hospital, Washington, and discharged from service January 13, 1865, and pensioned. Previous to leaving the hospital he was supplied with an artificial limb by the Jewett Patent Leg Company, of Washington, D. C. In his application for commutation, dated 1870, the pensioner represented the stump as being in a sound condition, but reported the artificial leg as having been unsatisfactory. Examiner F. R. Wagner, of Addison, N. Y., April 15, 1874, certified to "amputation about two inches below the trochanter minor, leaving the stump so short that an artificial limb cannot be worn." The pensioner was paid June 4, 1879. The specimen, No. 410, Army Medical Museum, consists of the middle third of the shaft of the injured femur. It was contributed by the operator.

CASE 430.—Private A. Tarcott, Co. H, 94th New York, aged 18 years, was wounded at Fredericksburg, December 13, 1862, and admitted to the field hospital of the 2d division, First Corps. Surgeon C. J. Nordquist, 83d New York, noted: "Gunshot wound; right leg amputated above knee." Two weeks after the injury the wounded man was conveyed to Washington, where he entered Trinity Church and subsequently Judiciary Square Hospital. On June 11, 1863, he was transferred to Central Park Hospital, New York City, whence Acting Assistant Surgeon G. F. Shrady contributed to the Army Medical Museum a cast of the stump (*Spec.* 1373), taken nine months after the amputation, with the following history: "According to the patient's account the lower portion of his right thigh was almost completely carried away by a grapeshot, and a great deal of hæmorrhage followed the injury. Amputation at the upper third by the long posterior flap was performed, on the day following the injury, by Surgeon G. W. Avery, 94th New York. There was an attack of gangrene of the stump in the latter part of April, and the patient has suffered from necrosis of the femur. When admitted to this hospital the stump was entirely healed." Two months later the patient was furnished with an artificial limb by E. D. Hudson, of New York City, and on November 15, 1863, he was discharged from service and pensioned. Examiner C. M. Johnson, of Watertown, New York, certified, May 7, 1873: "The stump is only three inches in length, tender and painful; the extremity of the femur being covered only by integument. He uses an artificial limb occasionally only." The pensioner was paid September 4, 1879.

FIG. 175.—Stump of right thigh, nine months after amputation. *Spec.* 1373.

Fatal Cases of Primary Amputation in the Upper Third of the Thigh.—There were two hundred and sixty-eight cases of this group. Two hundred and thirty patients were Union and thirty-eight were Confederate soldiers. Gangrene supervened in eight, pyæmia in thirty, and tetanus in four instances. In the following case the femur was fractured in its upper third:

CASE 431.—Private W. H. Croyle, Co. H, 55th Pennsylvania, aged 21 years, was wounded at Petersburg, June 16, 1864, and was admitted to hospital at Fort Monroe four days afterwards. Assistant Surgeon E. McClellan, U. S. A., reported: "Gunshot fracture of right femur, upper third. Amputation was performed in the field on the day of the injury, chloroform being used." On August 27th, the patient was transferred to DeCamp Hospital, David's Island, New York Harbor, whence Assistant Surgeon W. Webster, U. S. A., reported that the stump was still unhealed, and that the patient was a sufferer from chronic diarrhœa, from the effects of which he died September 7, 1864.

In the next two cases primary amputation in the upper third of the femur was performed for fractures in the middle third:

CASE 432.—Private M. H. Bartlett, Co. D, 4th Vermont, aged 19 years, was wounded at Funkstown, July 10, 1863, and entered the General Hospital at Frederick two days afterwards. Acting Assistant Surgeon C. M. Martin reported the injury and its result as follows: "A minié ball entered the outer side of the left thigh about the middle third and passed directly through, breaking the bone. Amputation in the upper third was performed on the field by the circular method. When admitted to this hospital there was partial union of the flaps, and granulation was progressing. Cold-water dressings were used. The patient was in good spirits and seemed to be doing finely until July 29th, when I saw a change for the worse, his pulse being low and quick. I then ordered pills of iron and quinine to be given three times a day, also full diet. Two days afterwards he had a slight chill and appeared rather weaker, the stump not looking healthy and the granulations very pale and flabby. Ten drops of nitric acid diluted in an ounce of water was then ordered to be applied once a day, and the pills were continued, with one ounce of whiskey every three hours. On the next day the patient was gradually sinking, and on August 2d, he had a severe chill in the morning. Death supervened at 9.30 A. M. on August 3, 1863. At the *post-mortem* examination, three hours after, the lungs, heart, spleen, and kidneys were found to be healthy, but the liver was highly congested. On removing the remaining portion of the femur considerable callus was discovered to have been thrown out, and in dissecting the muscles I found two circumscribed abscesses, each containing about half an ounce of pus." The upper portion of the femur was contributed to the Museum by Dr. Martin, and is numbered 3887 of the Surgical Section.

CASE 433.—Private F. Ward, Co. G, 45th Colored Infantry, was accidentally shot in the left thigh, near Fort Harrison, February 7, 1865. The nature of the injury and its result were recorded by Dr. N. Folsom, Regimental Surgeon, as follows: "A conical musket ball, fired at a distance of about three hundred yards, entered the outer aspect of the limb about the middle, fractured the femur, and, splitting in two, passed out on the inner aspect lower down. There were two orifices of exit, and two more pieces of the ball were found in the wound. The man was admitted to hospital within six hours after the injury. The loss of blood was estimated at a pint and a half, and the bone was found extensively comminuted, there being twenty-six fragments. Amputation by the circular method, at the junction of the upper and middle thirds of the bone, was performed under ether, three ligatures being applied and six sutures. Stimulants were freely exhibited, with beef tea, through the night. The case progressed well until forty-eight hours after the operation, when the patient was suddenly attacked with violent pain in the stump, and, the dressing being removed, adhesion was found to be quite extensive. The sutures were then removed and a finger gently introduced at the middle of the wound for one and a half inches, and relief was afforded by giving one-fourth of a grain of morphia. Wet lint covered with oiled silk was now applied, and the adhesions gradually gave way during the week following. Granulations appeared over about one-third of the surface, but were pale and inactive. The patient took tincture of chloride of iron, fifteen drops three times a day, and good diet and stimulants. Poultices were applied after the fourth day, but suppuration was at no time profuse. Considerable pain and tenderness of the other leg was also complained of. The pulse gradually rose from 100 to 130, and fell in strength. After the seventh day the patient's tongue became dry and brownish. He died on the twelfth day, February 19, 1865."

TABLE XXX.

Condensed Summary of Five Hundred and Thirty-three Cases of Primary Amputations in the Upper Third of the Femur for Shot Fractures.

[Recovery, 1–260; Death, 261–528; Result unknown, 529–533.]

No.	Name, Military Description, and Age.	Dates.	Operations, Operators, Result.
1	Abey, J., Corporal, B, 67th Penn , age 20.	Oct. 19, 20, '64.	Left; circular; Surg. R. Barr, 67th Penn. Disch'd May 8, 1865.
2	Allen, W. G., Capt., F, 25th Iowa, age 38.	Mar. 20, 20, '65.	Right; Surg. A. Sabine, 76th Ohio. Mustered out June 6, 1865.
3	*Amos, P. M.*, Pt., D, 45th North Carolina, age 27.	July 7, 7, '64.	Left. Prison, December 4, 1864.
4	Atchinson, J. N., Pt., F, 2d New Jersey, age 28.	Aug. 27, 27, '62.	Right; circular; Aug. 31st, hæm., lig. femoral. Disch'd June 3, '63.
5	Atwater, T. J., Pt., C, 112th Illinois.	Nov. 18, 19, '63.	Left; flap; Confederate surgeon. Disch'd Feb. 17, 1864.
6	Avery, R., Lt.-Col., 102d New York.	Nov. 24, 25, '63.	Right; flap; Surg. C. H. Lord, 102d N. Y. Disch'd June 27, '64.
7	Babcock, J. P., Pt., D, 18th Ohio, age 24.	May 14, 14, '64.	Right; circular. Disch'd May 20, 1865.
8	Barker, D., Serg't, K, 10th Illinois Cavalry.	April 18, 18, '63.	Left; flap. Disch'd June 29, 1863.
9	Barnes, S., Pt., B, 12th Illinois.	Oct. 3, 5, '62.	Right. Disch'd April 6, 1863.
10	Barrett, G. W., Serg't, I, 7th Ohio.	Aug. 9, 11, '62.	Right; circular. Disch'd Oct. 27, 1862.
11	Barton, G., Lieut., D, 81st Pennsylvania.	Dec. 13, 13, '62.	Right; circular. Disch'd April 16, 1863.
12	Bassett, W., Pt., A, 111th Pennsylvania.	Sept. 17, 17, '62.	Left; flap. Disch'd Dec. 1, 1862.
13	Bauer, A., Serg't, A, 102d New York, age 21.	June 27, 27, '64.	Left; circ.; Surg. A. K. Fifield, 29th Ohio. Disch'd Nov. 22, '64. *Spec.* 2338.
14	Bedell, H. E., Lieut., D, 11th Vermont.	Sept. 13, 13, '64.	Left; Surg. C. B. Park, 11th Vermont. Disch'd Feb. 20, 1865.
15	Beaver, J. A., Colonel, 148th Pennsylvania.	Aug. 25, 26, '64.	Right; circ.; Surg. J. W. Wishart, 140th Penn. Disch'd Dec. 22, '64.
16	Bell, J., Serg't, D, 150th New York, age 28.	Mar. 19, 19, '65.	Right; flap; Skey's operation; Surg. C. M. Campbell, 150th N. York. Disch'd Oct. 13, 1865.
17	*Benedrum, C. W.*, Pt., G, 17th Virginia Cavalry.	July 1, 1, '63.	Left. Recovered.
18	Benninghoff, F., Corp'l, B, 1st Mich. Artillery, age 28.	Nov. 22, 22, '64.	Right; flap; Surg. A. Sabine, 76th Ohio. Disch'd June 18, 1865.
19	*Bine, J.*, Pt., I, Stuart Horse Art'y. age 43.	May 2, 2, '63.	Right; Surg. Randolph, C. S. A. Furloughed June 11, 1863.
20	Birt, W. T., Corp'l, D, 47th Illinois.	May 22, 22, '63.	Left; circular; Surg. H. Z. Gill, U. S. V. Disch'd Sept. 23, 1863. Died October, 1863; diarrhœa.
21	Boden, E. G., Pt., A, 1st Vermont, age 19.	May 5, 5, '64.	Right; circular. Disch'd August 30, 1865.
22	Brannagan, W., Pt., H, 70th New York, age 21.	July 2, 4, '63.	Left; flap. Veteran Res. Corps Dec. 31, 1863.
23	Brown, A. P., Serg't, K, 74th Illinois, age 26.	June 18, 18, '64.	Right; flap; Surgs. W. P. Pierce, 88th Ill., and H. E. Hasse, 24th Wis. Disch'd Oct. 28, 1864.
24	Brown, C. E., Lt. Col., 63d Ohio, age 30.	July 22, 23, '64.	Left; flap; Surg. A. B. Monohan, 63d Ohio. Disch'd July 8, 18 5.
25	Bruck, T., Capt., F, 8th New York.	June 8, 10, '62.	Left; Drs. Allen, Davis, and Herald, C. S. A. M. O. Apr. 23, '63.
26	Bryant, E. A., Musician, C, 4th N. Hamp., age 24.	July 30, 30, '64.	Right; circular. Disch'd Oct. 18, 1864.
27	*Butler, G.*, Pt., 31st Mississippi, age 20.	July 20, 20, '64.	Right; circular. To Provost Marshal Dec. 1, 1864.
28	Bull, H., Pt., K, 7th Indiana, age 24.	Nov. 28, 28, '63.	Right; circ.; Surg. G. W. New, 7th Ind. Disch'd April 1, 1864.
29	Campbell, J., Pt., L, 2d Penn. Art'y, age 24.	Sept. 29, 30, '64.	Right; flap. Disch'd July 10, '65.
30	Capstran, A., Pt., H, 98th New York, age 18.	May 13, 13, '64.	Left; circular. Disch'd October 18, 1864.
31	Carroll, J., Pt., H, 25th New York, age 19.	June 1, 2, '62.	Right. Disch'd June 23, 1863. *Spec.* 2400.
32	Carpenter, I., Pt., H, 102d New York, age 19.	Dec. 18, 18, '64.	Right; circular. Disch'd Oct. 5, 1865.
33	*Carter, W. W.*, Pt., I, 2d Tenn. Cav., age 26.	April 2, 2, '65.	Right; circular. To Provost Marshal May 6, 1865.
34	*Carter, A. L.*, Pt., A, 56th Virginia.	June 27, 27, '62.	Amp. by Surg. Evans, C. S. A. Recovery.
35	*Cashine, J. H.*, Pt., K, 5th N. Carolina, age 30.	April 3, 4, '65.	Left. Released July 10, 1865.
36	Cassell, R., Pt., E, 29th Col'd Troops, age 38.	April 2, 2, '65.	Right; circular. Disch'd July 11, 1865.
37	Clarke, H. G., Corp'l, A, 111th N. York, age 22.	July 2, 3, '63.	Right; circ.; Surg. O. Munson, 108th N. Y. Disch'd Oct. 15, '63.
38	Cook, D., Pt., F, 118th Ohio, age 21.	Dec. 29, 29, '63.	Right; circ. Disch'd June 23, 1865.
39	Cookson, R. B., Pt., B, 14th Maine, age 18.	Aug. 5, 5, '62.	Left; flap; Surg. E. Adams, 14th Maine. Disch'd Sept. 26, 1862.
40	Cowger, G. M., Serg't, E, 17th Iowa.	May 14, 15, '63.	Left; circular. Disch'd Nov. 23, 1863.
41	Cozad, H. J., Pt., A, 6th Missouri.	June 2, 2, '61.	Right; Surgs. G. S. Walker and W. F. McChesney, 6th Missouri. Disch'd June 16, 1862.
42	Congdon, J., Pt., H, 30th Ohio, age 21.	June 21, 24, '64.	Left; circular; Surg. A. K. Fifield, 29th Ohio. Disch'd July 19, '65.
43	Crawford, G. W., Lieut., F, 6th Michigan Cav.	July 14, 14, '63.	Flap. Discharged Feb. 17, 1864.
44	*Cribb, D. W. P.*, Pt., F, 25th Georgia.	May 12, 13, '64.	Left; Surg. Gelks, 26th Georgia. Recovery.
45	Criss, S. G., Pt., A, 7th West Virginia, age 19.	May 24, 24, '64.	Right; flap; Surg. D. W. Maull, 1st Del. Disch'd May 27, 1865.
46	Crowley, D., Pt., F, 25th New York, age 35.	Sept. 17, 17, '62.	Right. Discharged.
47	Cue, E., Pt., F, 97th New York.	Sept. 17, 18, '62.	Right; flap. Disch'd May 15, '63.
48	Curtis, E. D., Serg't, I, 1st Penn. Res., age 25.	July 2, 3, '63.	Right; flap. Disch'd February 3, 1864.
49	Dart, E. S., Pt., G, 8th Michigan.	June 16, 17, '62.	Left. Discharged Oct. 18, 1862.
50	*Davis, S. M.*, Pt., A, 24th Georgia.	July 1, 1, '64.	Left; Surg. Mitchell, C. S. A. Recovered.
51	Dailey, P., Pt., G, 140th New York, age 29.	May 5, 6, '64.	Right; flap; Confederate surgeon. Disch'd June 11, 1865.
52	Dana, D. Z., Pt., B, 60th New York, age 35.	June 15, 15, '64.	Right; circ.; Surg. H. B. Whiton, 60th N. Y. Disch'd Mar. 7, '65.
53	*Dean, H. H.*, Pt., Provost Guard.	July 18, 20, '63.	Surgeon Gleeves, C. S. A. Recovered.
54	Dell, F., Pt., F, 70th New York, age 21.	May 1, 2, '62.	Right; Ass't Surg. J. Ash, 70th N. York. Disch'd Oct. 13, '62.
55	Delcher, P., Pt., K, 3d N. Y. Cavalry, age 42.	May 16, 16, '64.	Left; flap; Confederate surgeon. Disch'd March 8, 1865
56	Dermock, T., Pt., B, 7th Conn., age 27.	Oct. 8, 8, '63.	Left; flap; Surg. G. C. Jarvis, 7th Conn. Disch'd Dec. 24, 1863.
57	Donohue, J. S., Capt., A, 8th Michigan, age 27.	May 6, 7, '64.	Left; circ.; Surg. W. B. Fox, 8th Mich. Disch'd Sept. 28, 1864.
58	Downs, T., Pt., F, 88th New York, age 38.	Sept. 17, 17, '62.	Right; Surg. F. Reynolds, 88th N. Y. Sept. 29th, hæm., fem. tied. Disch'd March 13, 1863.
59	[1] *Duncan, M. I.*, Serg't, G, 21st Virginia.	Oct. 26, 27, '63.	Right; circ.; Surgs. Coleman and Fleming, C. S. A. Fur. Jan. 11, '64.
60	Dunlap, I. N., Pt., I, 17th Illinois.	Feb. 15, 15, '62.	Left; flap; Surg. C. Goodbrake, 20th Ill. Disch'd Mar. 28, 1862.
61	Dunham, C. R., Pt., H, 1st Maryland, age 30.	June 3, 3, '64.	Right; circ.; Surg. A. A. White, 8th Md. Disch'd Mar. 30, 1865.
62	*Emmitt, J.*, Serg't, C, 56th North Carolina.	July 30, 30, '64.	Left; Surg. C. H. Ladd, C. S. A. Recovery.

In two hundred and five of the five hundred and thirty-three cases enumerated in the foregoing table the precise seat of fracture in the femur was not indicated. In the remaining three hundred and twenty-eight cases the fracture was in the upper third of the femur in sixty-six, in the middle third in one hundred and seventy, in the lower third in fifty, at the knee joint in thirty-seven, and in the leg in five instances.

Primary Amputations in the Middle Third of the Femur.—There were eleven hundred and fifty-seven of these operations. The results were ascertained in eleven hundred and forty-nine cases; six hundred and eighty-six were successful, and four hundred and sixty-three proved fatal, a mortality of 40.3 per cent. The operations were on the right side in five hundred and forty-four, and on the left in five hundred and thirty-four instances; in seventy-nine cases the side was not specified.

Recoveries after Primary Amputation in the Middle Third of the Femur.—The six hundred and eighty-six operations of this group were performed on one hundred and forty-five Confederate and five hundred and forty-one Union soldiers. Of the latter, two have become insane, one was retired, and five hundred and thirty-seven were pensioned; in one instance no application for pension seems to have been made.

Case 434.—Private J. Kells, Co. I, 113th Ohio, aged 44 years, was wounded at Jonesboro', September 1, 1864. He was admitted to the field hospital of the 2d division, Fourteenth Corps, whence Surgeon W. C. Daniels, U. S. V., reported: "Shot fracture of right thigh at middle third by a minié ball; limb amputated." From the field hospital the patient passed to Chattanooga, thence to Cumberland, Nashville, and afterwards to Brown, Louisville, from which hospitals his case was described as an "antero-posterior flap amputation of the thigh at the middle third." He was discharged from service at Camp Dennison March 21, 1865, and supplied with a Palmer artificial leg four months afterwards. He became a pensioner, and has been paid as such June 4, 1879. In his application for commutation he represented the stump as "healed and sound," and stated that Surgeon T. B. Williams, 121st Ohio, performed the amputation.

In the following instance a large sequestrum was removed from the stump of the femur three months after the amputation:

Case 435.—Private J. McMahon, Co. I, 6th New York Cavalry, aged 23 years, was wounded in the left leg, at Todd's Tavern, May 7, 1864. He was admitted to a field hospital of the Cavalry Corps, where amputation was performed but not recorded, and five days afterwards he was transferred to Washington. Assistant Surgeon W. Thomson, U. S. A., made the following report of the case: "The wound was caused by a musket ball, which caused a fracture of the femur extending into knee joint, for which amputation was performed at the middle third, by the circular method, within an hour, chloroform being used. He was admitted to Douglas Hospital May 12th, at which time a large slough existed on the anterior flap, which soon separated, exposing the end of the bone. There was no vigorous effort at repair, the granulations being pale and flabby. The patient's general condition was unfavorable; he was much depressed and very pallid, and had a severe diarrhœa. On June 20th, the cellular tissue of the stump again began to slough, and, on the 22d, it was found requisite to apply pure bromine. On the 23d most of the sloughs separated, and, by the next day, the stump was clean and the granulations more florid and healthy. One inch and a half of the end of the femur was in a state of necrosis and protruding. On August 11th, a sequestrum, nine inches in length, was removed by extraction, leaving a deep cavity in the stump, which was bounded externally by a large and firm cylinder of new bone. The patient's improvement was then rapid, and, by November 1st, he was considered convalescent. This man had remained for weeks as pale as death and so feeble as to be unable to lift his head from his pillow. He seemed daily on the verge of the chill of pyæmia, and his case was recognized and pointed out as one of osteomyelitis of the femur, from which—if death did not result—a long exfoliation would be removed." On May 18, 1865, the patient was discharged from

service, and several weeks after he was furnished with an artificial limb by the firm of A. A. Marks, of New York City. In his application for commutation, dated 1870, the pensioner stated that the amputation was performed by Assistant Surgeon S. C. Sanger, 6th New York Cavalry, also that the stump was in a healthy condition. The pensioner was paid June 4, 1879. The sequestrum (*Spec.* 4281) was contributed to the Museum by Dr. Thomson, and is shown, reduced in size one-third, in FIG. 4 of PLATE LXIX, opposite.

Amputation of the right thigh in the middle third and of the left leg at the knee joint was successfully performed in the following instance:

CASE 436.—Corporal C. N. Lapham, Co. K, 1st Vermont Cavalry, aged 23 years, was wounded during the engagement near Boonsboro', July 8, 1863, by a cannon ball, which carried away both legs. He was conveyed to the field hospital at Boonsboro', where both limbs were amputated two days after the receipt of the injury. Four months after the operation the patient was deemed well enough to be allowed to go to his home, where he remained until the following year. On May 31, 1864, he was furnished with artificial limbs by Dr. E. D. Hudson, of New York City, who contributed the photographs represented in the annexed cuts (FIGS. 176, 177) and the following description of the operation: "The right thigh was amputated at the middle third, by the antero-posterior flap method, on account of great comminution of the leg involving the knee joint; the stump is healed and in a favorable condition. The left leg was disarticulated at the knee joint. This operation was also performed by antero-posterior flaps, and the stump is healed and in good condition, though the supporting cicatrix at the base is not good. The condyles of the femur, as a base, form the most useful, reliable, and comfortable support, and constitute his chief dependence, and the benefits of disarticulation, when compared with amputations of the thigh, are shown to be incalculable." The patient was discharged from Baxter Hospital, at Burlington, Vermont, Aug. 25, 1864, and pensioned. Five months later, when a student at the Collegiate Institute in Poughkeepsie, N. Y., he wrote to Dr. Hudson that "he could walk with ease on level ground, get up and down stairs readily, and was getting along much better than he anticipated in so short a time." Some time afterwards he obtained an appointment as clerk in the U. S. Treasury Department at Washington, in which occupation he is still employed. His pension was paid September 4, 1879. In his application for commutation he reported that Surgeon L. P. Woods, 5th New York Cavalry, was the operator who amputated his limbs.

FIG. 176.—Amputation of right thigh at middle third and of left leg at knee joint. [From a photograph.]

FIG 177.—Appearance of patient with artificial legs. [From a photograph.]

In thirteen instances re-amputation of the thigh became necessary, and in fourteen cases the protruding ends of the femur were removed. In the following, four inches of the extremity of the bone were exsected nearly seven months after the amputation.

CASE 437.—Private J. Wearing, Co. L, 2d Pennsylvania Heavy Artillery, aged 20 years, was wounded at Petersburg, June 17, 1864, and admitted to the field hospital of the 1st division, Ninth Corps, where Surgeon M. K. Hogan, U. S. V., recorded: "Wound of left knee joint; amputation at junction of middle and lower third of thigh." One week after the reception of the injury the man was transferred to Finley Hospital, Washington, and in October following he entered Broad and Cherry Streets Hospital, Philadelphia, whence Acting Assistant Surgeon T. C. Brainerd made the following report: "At the date of admission the femur protruded about one-fourth of an inch, and the stump was healed to within one inch of the bone. The patient being anæmic, iron and quinine were administered. Simple dressings were applied to the stump. By November 15th his general health had improved and the line of separation was forming around the protruding portion of the bone. On December 1st, the ulcer upon the stump presented a sloughing tendency, but again cleaned up. On January 6, 1865, about four inches of the extremity of the femur was exsected by cutting down upon it from the outer anterior surface of the stump and sawing through the bone with a chain saw. The bone removed was necrosed and surrounded by a large amount of reparative material. A small artery spouted from the medullary canal of the bone, the hæmorrhage from which was promptly controlled by pressing a piece of soft wax into the canal. Three ligatures were applied and ether was used. The operation was performed by Acting Assistant Surgeon H. M. Bellows. The patient reacted promptly. Simple dressings were continued to the stump. Two days

later an attack of erysipelas supervened, extending as far up as the groin, but yielding to treatment, and by January 15th it had entirely disappeared and the general condition had much improved. One month later cicatrization was almost complete, and the patient was walking about with the aid of crutches." In April he was transferred to South Street Hospital, and subsequently to Chester, where he was discharged from service July 26, 1865, and pensioned. Some weeks afterwards the man was supplied with an artificial leg, manufactured by R. Clements. In his application for commutation, dated 1870, he represented the stump as being in a sound and healthy condition. The pensioner was paid June 4, 1879. The sequestrum (*Spec.* 4196) removed from the stump was contributed to the Museum by the operator, and is represented in FIG. 3 of PLATE LXX, opposite p. 242.

Thirteen of the pensioners have died since the date of their discharge from the service; one from lung disease, three of debility, and nine of causes not stated:

FIG. 178.—Comminuted lower half of right femur. *Spec.* 4120.

CASE 438.—Corporal J. Bidlingmaier, Co. H, 73d New York, aged 46 years, was wounded before Petersburg, September 11, 1864. Surgeon O. Everts, 20th Indiana, noted his admission to the field hospital of the 3d division, Second Corps, with "shot fracture of thigh, followed by amputation." From the field the wounded man was transferred to the depot hospital at City Point, and thence, on October 8th, to Washington. Assistant Surgeon J. C. McKee, U. S. A., reported his entrance into Lincoln Hospital, with "antero-posterior flap amputation of the right thigh at the middle third," also that he was furloughed December 9th. The patient subsequently entered Judiciary Square Hospital, and on May 6, 1865, he was discharged from service, having been previously supplied with an artificial limb by the Jewett Patent Leg Co., of Washington, D. C. He was a pensioner until June 16, 1871, when he died of marasmus, his attending physician certifying that "it was evident that some portion of the splintered bone remained in the stump, as abscesses frequently formed thereon and copious discharges ensued;" also that the disease, as a consequence, first became apparent about the first of April, 1871. The amputated portion of the femur, represented in the wood-cut (FIG. 178), was contributed by Surgeon D. S. Hays, 110th Pennsylvania, who performed the operation. The specimen shows that the shaft was badly comminuted by a conoidal ball, which flattened, in a mushroom shape, against the anterior surface in the lowest third.

Fatal Cases of Primary Amputation in the Middle Third of the Thigh.—The four hundred and sixty-three operations of this group were performed on four hundred and sixty-one patients; in two instances both thighs having been primarily removed at the middle third. Sixty-seven were Confederate and three hundred and ninety-four were Union soldiers:

CASE 439.—Private *G. Cox*, Co. K, 1st North Carolina Cavalry, aged 27 years, was wounded at Brandy Station, June 9, 1863. He was admitted to a field hospital of the Fifth Corps, whence Assistant Surgeon B. Howard, U. S. A., reported the following history: "The patient was a man of usual good health but had the bloated appearance of a habitual drinker. He was shot in the right thigh, and was brought to Kelly's Ford, a distance of about three miles, in an ambulance. On examination I found a wound of entrance on the outer side of the thigh, a little above its middle, but there was no wound of exit. The wound of entrance was very small, as if made by a pistol ball. The femur was badly shattered. The patient complained of having lost a good deal of blood on his way to Kelly's Ford. I immediately proceeded to amputate near the upper third by the circular mode. The patient suffered considerably from shock, but rallied comfortably, and was transported eight miles the next morning in an ambulance, and thence by cars to Alexandria. On examination of the amputated leg the femur was found to be shattered more than six and a half inches, but not comminuted as finely as often happens in fractures by a minié rifle ball, this fracture being more vitreous in appearance and furnishing but one small fragment, all the others being large ones. The ball had entered the outer side of the thigh, passed behind and partially around the femur, entering at its inner aspect, and lodging in the medullary canal. The interesting point in the case is the relation of the extensiveness of the fracture to the weight and the diminished velocity of the ball; that the bone should have been so extensively shattered by a pistol ball, which, when subsequently weighed, did not exceed five scruples and six grains, and that the mischief was all done, too, after the ball had been so much deflected from its original course." Surgeon T. R. Spencer, U. S. V., reported the patient's admission to Prince Street Hospital, and the result of the case as follows: "On June 19th and 23d, hæmorrhage occurred from the external circumflex artery, for which compression and cold applications were made. The loss of blood amounted to six ounces. The patient looked anæmic, and there was considerable sloughing of the stump. Death followed on June 24, 1863." The amputated portion of the femur was contributed to the Museum by the operator, and is numbered 1233, *Surg. Section* (FIG. 179).

FIG. 179.—Comminution of middle third of right femur. *Spec.* 1233.

CASE 440.—Sergeant John Sproul, Co. C, 40th New York, aged 24 years, received at Kelly's Ford, November 7, 1863, a conoidal musket ball wound, causing a compound fracture of the left femur just above the knee. He was taken to the field hospital of the 1st division, Third Corps, Surgeon J. W. Lyman, U. S. V., in charge, and amputation of the thigh in the middle third, anterior and posterior flap method, was performed by Surgeon A. Campbell, 40th New York, on the day of injury. He was conveyed to Washington, and admitted into the Douglas Hospital on November 9th. His attending medical officer, Assistant Surgeon W. F. Norris, U. S. A., reports, November 16th: It was found impossible to support the heavy posterior muscular flap; the sutures sloughed out, and there was a great gaping surface discharging profusely, but normal in appearance. The patient was very pallid. The stump was

thoroughly supported by adhesive straps, and the best nutrients, with stimulants, were administered. 24th, there was slight tenderness along the femoral artery and slight enlargement of the inguinal glands. There was no vigorous effort at repair in the stump, which remained pale and flabby, and his general condition became worse daily. December 4th, there were well-marked chills with fever in the evening, pulse 120 and feeble, respiration hurried, sweating, and nausea. These symptoms became hourly worse: his pulse became countless, his respiration sighing and very rapid, his face pinched and anxious; occasional vomits of a green bilous matter: he finally died, on December 7th, at 4 o'clock P. M., of pyæmia. Autopsy sixteen hours after death. Assistant Surgeon W. Thomson, U. S. A., records: "The most careful examination failed to find a trace of inflammation or coagulation in the blood-vessels. The soft tissues of the stump were perfectly normal. There were found in the thoracic cavity the usual traces of pyæmia. The lungs anteriorly were pale, posteriorly they were both coated over the lower lobes with recent yellow and soft ill-looking lymph. There was no considerable effusion or adhesions; no traces of a frank pleuritis, but of a local asthenic inflammation were found. Both lungs were congested, hardened, and dark in color posteriorly, and in the left there were several small yellowish-white spaces, apparently abscesses. * * The other organs, except the cerebro-spinal, were examined and found normal except the spleen, which was slightly hardened and congested. No trace of embolia was found in the lungs, nor was death caused by the secondary changes there produced. The destruction of pulmonary tissue had not progressed sufficiently. There must have been the absorption, by the veins most probably, from this medullary and cancellated portion of the femur, of a material soluble in the fluids of the blood, and produced, in the cadaveric changes that took place in the organic matter—dead, but confined in this cancellated bone. This caused the fatal toxicæmia which overpowers the nervous system, and may have also caused those local changes found in the posterior portions of both lungs. It seems strongly probable that it is due to blood poisoning, introduced by the veins, since all cases of pyæmia exhibit pathological changes in the lungs, where the venous blood becomes distributed to thin delicate structures before being depurated by exposure to the atmosphere. The case was about to be relinquished as incomprehensible, when it was proposed by Dr. Norris to saw the femur from its head to its extremity longitudinally, and thus expose its medullary canal. A small quantity of apparently healthy pus had been found between the periosteum and the shaft two inches from the sawn end, and there were a few osteophytes clinging to the bone at that point. When, however, the bone had been separated in its long diameter, its medullary canal presented the traces of pathological action. This canal and the cancellated structure extending past the trochanters to a point half way through the head were found filled with a yellowish-green substance, intolerably fetid, and resembling, more than anything else, the debris of hospital gangrene." The bone was sent at once to the Museum and portrayed in colors. No pus was found in this bone, and, under the microscope, nothing but debris. The connective tissue seemed to have perished *en masse*. In PLATE XXXII, opposite, the diseased stump of the femur is represented, and PLATE XXXI, opp. p. 228, exhibits the gangrenous condition of the medullary canal.

CASE 441.—Private William Crawford, Co. B, 2d Pennsylvania Cavalry, aged 40 years, had his right leg shattered near the knee by a fragment of shell, at the battle of Spottsylvania, May 12, 1864. The soft parts were much torn, and the popliteal artery was divided. Amputation was immediately performed near the middle of the thigh by Surgeon Charles Bower, 6th Pennsylvania Reserves. The patient was sent to Washington, and admitted, on July 16th, to Lincoln Hospital. He was in an exhausted condition and had no appetite. He utterly refused to take bark or stimulants of any description. The tongue and fauces were covered with aphthæ. There was diarrhœa, from which, in a chronic form, the patient had long suffered. He died on July 27, 1864. There was extreme emaciation. At the autopsy but slight lesions were found in the viscera, except the great intestine, which was studded with ulcers. The necrosed extremity of the femur slightly protruded from the wound. This was the end of a very large, loose sequestrum, invested by a fragile involucrum. The specimen in the Army Medical Museum, No. 2890, *Surgical Section*, consists of the stump of the right femur, with a very large sequestrum in process of separation and a partial involucrum formed.

The histories of the two cases of primary amputations of both thighs in the middle third are very brief. The patients died on the day following the operations:

CASE 442.—Sergeant Theodore Doud, Co. C, 2d Michigan, received, at Petersburg, July 30, 1864, a shell wound of both thighs. He was carried to the field hospital of the 3d division, Ninth Corps, where, on the same day, Surgeon W. B. Fox, 8th Michigan, amputated both thighs at the middle third. Death resulted July 31, 1864. The case is recorded by Surgeon P. A. O'Connell, U. S. V.

CASE 443.—Corporal John W. Woodworth, Co. H, 11th Infantry, was wounded at Rappahannock Station, November 7, 1863, a shell fracturing both femurs at the middle third. He was taken to the field hospital of the Fifth Corps, and both thighs were amputated in the middle third. He died the next day, November 8, 1863. The case is reported by Assistant Surgeon E. DeW. Breneman, U. S. A.

Pyæmia was observed in seventy-six, gangrene in eighteen, tetanus in seven of the four hundred and sixty-three fatal primary amputations in the middle third of the thigh, and in forty-four instances hæmorrhages occurred subsequent to the operations. In three cases the amputation in the thigh was accompanied by operations in the upper extremities, and in one instance the opposite limb was amputated in the leg.[1]

[1] In the case of Private W. J. Rand, K, 45th Massachusetts (TABLE XXXI, p. 239, No. 1,018, and *Second Surgical Volume*, TABLE XLIV, p. 634, No. 87), the left arm was removed at the shoulder-joint; the left arm was amputated in the lower third in the case of Private H. Jackson, E, 4th Colored Troops (TABLE XXXI, p. 237, No. 904, and *Second Surgical Volume*, TABLE LXXIII, p. 747, No. 40); three inches of the right radius were excised in the case of Sergeant J. Robinson, H, 48th Illinois (TABLE XXXI, p. 239, No. 1,033, and *Second Surgical Volume*, TABLE CXXVII, p. 952, No. 51). The left leg was amputated in the lower third in the case of Private S. Banks, C, 43d Colored Troops (TABLE XXXI, p. 235, No. 706).

DISEASED STUMP OF FEMUR

TABLE XXXI.

Condensed Summary of Eleven Hundred and Fifty-seven Cases of Primary Amputations in the Middle Third of the Femur for Shot Fracture.

[Recoveries, 1—685; Deaths, 687—1,149; Results unknown, 1,150—1,157.]

NO.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	OPERATIONS, OPERATORS, RESULT.
1	Adams, C. B., Pt., G, 116th N. York, age 37.	Sept. 19, 20, '64.	Right; circ. A. Surg. J. Homans, jr., U.S.A. Dis. Aug. 25, '65.
2	Adams, J., Pt., H, 27th Ohio.	Mar. 13, 13, '62.	Right; flap. Disch'd Aug. 2, '62.
3	Alexander, J., Pt., A, 129th Penn., age 25.	May 4, 4, '63.	Right. Surg. W. G. Nugent, 126th Penn. Disch'd Mar. 16, 1864.
4	Alexander, J., Pt., D, 22d C. T., age 34.	Sept. 20, 21, '64.	Left; flap. Mar. 15, '65, removed necro'd bone. Dis. Mar. 20, '65.
5	Allaback, E. W., Pt., A, 52d Pennsylvania.	May 24, 24, '62.	Left; flap. Surg. W. S. Woods, 52d Penn. Disch'd Aug. 1, 1862.
6	Allen, F. A., Pt., I, 8th N. Y. Cavalry, age 29.	June 3, 3, '64.	Left; flap. Subseq. operations. Disch'd July 13, 1865.
7	Allen, G. W., Serg't, A, 3d Mass. Cav., age 27.	Oct. 19, 20, '64.	Right; circ. Surg. D. F. Leavitt, 3d Mass. Cav. Dis. May 31, '65.
8	*Allen, S.*, Pt., H, 23d N. Carolina, age 25.	July 1, 3, '63.	Left; circular. Exchanged Nov. 12, 1863.
9	Allroth, W., Pt., K, 46th New York, age 30.	July 30, 30, '64.	Left; flap. Surg. A. F. Whelan, 1st Mich. S. S. Dis. Sept. 11, '65.
10	Altenberger, J., Pt., F, 37th Ohio.	May 19, 19, '63.	Left. Surg. S. P. Bonner, 47th Ohio. Subsequent operation. Disch'd Sept. 8, 1863.
11	Ammerman, R. W., Pt., B, 148th Penn., age 22.	May 12, 13, '64.	Right; circ. June 24th, removed three ins. femur. Disch'd May 30, 1865. *Spec.* 2698.
12	Andrews, D., Pt., I, 62d Penn., age 18.	May 6, 6, '64.	Left; ant. post. flap. Discharged July 26, 1865.
13	*Andrews, W. A.*, Pt., E, 3d C. S. Inf., age 27.	Nov. 30, Dec. 1, '64.	Right; lateral flap. Exchanged March 7, 1865.
14	Arts, J., Capt., K, 2d New York.	June 25, 25, '62.	Left. Discharged Nov. 10, 1862.
15	Aschman, R., Capt., A, 1st Sharpshooters.	Aug. 15, 15, '64.	Right. Surg. H. F. Lyster, 5th Mich. Disch'd Aug. 19, 1864.
16	Austin, W. F., Capt., K, 9th Kentucky.	April 7, 8, '62.	Right. Dr. W. W. Goldsmith, Louisville. Disch'd Apr. 19, '62.
17	Azdell, J., Pt., C, 104th Ohio, age 29.	May 27, 27, '64.	Left; circ. Surg. F. H. Rodgers, 104th Ohio. Dis. June 13, 1865.
18	Bachman, C., Pt., D, 198th Penn., age 28.	Mar. 29, 29, '65.	Left; flap. Discharged June 27, 1865.
19	*Bagley, T. R.*, Pt., H, 24th South Carolina.	May 14, 14, '63.	——. Recovered.
20	Bailey, J. C., Pt., D, 4th Ohio.	Dec. 13, 14, '62.	Left; flap. Disch'd April 22, '63.
21	Ball, L., Serg't, F, 3d Kentucky, age 24.	Sept. 19, 21, '63.	Right; flap. One inch fem. rem'd. Disch'd March 22, 1864.
22	Barnett, R., Pt., D, 1st N. Y. Dragoons, age 25.	Oct. 14, 15, '64.	Left; ant. post. flap. Surg. A. P. Clark, 6th N. Y. Cav. Disch'd Oct. 30, 1865.
23	Barnes, J. W., Pt., C, 11th Tennessee Cav.	Jan. 28, 28, '64.	Left; flap. Surg. T. H. Kearney, 45th Ohio. Disch'd Mar. 28, '65.
24	Barnes, W., Serg't, I, 13th Mass., age 38.	Aug. 30, 31, '62.	Left. Disch'd April 23, 1863.
25	Barnhart, T. P., Pt., F, 3d Wisconsin, age 19.	Mar. 16, 16, '65.	Right; circular. Disch'd Aug. 22, 1865.
26	*Barraham, J. H.*, Pt., H, 2d North Carolina.	Aug. 16, 16, '64.	Right; circular. Retired March 17, 1865.
27	Barrett, S., Pt., K, 69th Ohio, age 17.	Mar. 19, 20, '65.	Left; flap. Confederate surgeon. Disch'd Oct. 14, 1865.
28	Bartlett, W. F., Capt., I, 20th Mass., age 21.	April 25, 25, '62.	Left; circ. Surg. N. Hayward, 20th Mass. Disch'd July, 1866.
29	Bartling, H., Pt., L, 9th Mich. Cavalry, age 22.	June 12, 12, '64.	Left; lat. flap. Surg. A. Nash, 9th Mich. Cav. Disch. May 12, 1865.
30	Barton, M., Pt., E, 72d Indiana.	May 9, 10, '63.	Right. Surg. D. B. Rice, 102d Ill. Disch'd Sept. 15, 1863.
31	Batch, P., Pt., K, 99th Ohio, age 21.	June 20, 20, '64.	Right; ant. post. flap. Surg. J. T. Woods, 99th Ohio. Disch'd Nov. 22, 1865.
32	Becht, A., Pt., E, 52d New York.	June 1, 3, '62.	Left. Disch'd Dec. 25, 1862.
33	Beck, G. H., Corp'l, I, 11th Penn., age 18.	May 5, 6, '64.	Left; circ. Ass't Surg. W. P. Osborn, 11th Penn. Disch'd June 1, 1865.
34	Becker, C., Corp'l, B, 12th Missouri.	Mar. 8, 8, '62.	Right; circ. Surg. C. Cook, 12th Missouri. Discharged.

[2] Thomson (W.), *Report of Cases of Hosp. Gangrene treated in Douglas Hospital, Washington, D. C.*, in *Am. Jour. Med. Sci.*, 1864, Vol. XLVII, p. 382

The seat of injury in these eleven hundred and fifty-seven primary amputations in the middle third of the thigh is reported to have been in the middle third of the femur in ninety-eight, in the lower third in three hundred and fifty-eight, in the femur without indication of the third in two hundred and ninety, in the knee joint in three hundred and fifty-three, and in the leg in fifty-eight instances.

Primary Amputations in the Lower Third of the Femur.—Of nineteen hundred and fourteen primary amputations in the lower third of the femur the result could not be ascertained in fourteen instances. Nine hundred and seventy-three operations were successful, and nine hundred and twenty-seven were fatal, a mortality of 48.7 per cent. In one hundred and fifty-eight instances the limb implicated was not indicated; in eight hundred and forty-five the right, and in nine hundred and eleven the left thigh was amputated.

Recoveries after Primary Amputations in the Lower Third of the Femur.—The nine hundred and seventy-three operations of this group were performed on nine hundred and seventy-one patients, the discrepancy in numbers being due to the fact that double amputations were performed in two instances. Two hundred and twenty-nine were Confederate, and seven hundred and forty-two were Union soldiers. Of the latter, seven hundred and thirty-four were pensioned, and four retired; the names of the remaining four patients are not borne on the rolls of the Pension Office.

CASE 444.—Corporal J. A. Crawford, Co. K, 6th Wisconsin, aged 24 years, was wounded through the knee joint, at Gettysburg, July 1, 1863. He was admitted to the Seminary Hospital, whence Acting Assistant Surgeon W. M. Welch made the following report: "The limb was amputated at the lower third of the thigh on the day following the injury. The patient came under my care on August 15th, at which time the stump was granulating slowly and there was a free discharge of healthy pus; but the flaps had sloughed, leaving the end of the femur bare. A roller bandage was applied to prevent retraction of the muscles, and warm-water dressings with disinfectants were used, iron and stimulants being given internally. The patient's general health was disturbed, though his appetite was tolerably fair. He improved gradually, and was transferred to Camp Letterman on September 2d." Assistant Surgeon H. C: May, 145th New York, continued the history as follows: "The patient came under my charge on October 12th, being very feeble and troubled with profuse and obstinate diarrhœa, having no appetite, and suffering from hectic fever and much pain, also an abscess along the course of the lower end of the bone. The stump was conical shaped, with the end of the femur exposed, and the granulations were pale and flabby. Astringents and tonics were administered. On October 30th, the diarrhœa was almost controlled, but great pain and irritation was felt about the stump, and, chloroform having been given, a sequestrum four and a half inches long, and consisting of a complete section of the lower end of the bone, was removed by forcible traction. The surfaces of the bone were found to be very rough and surrounded with a wall of callus. The patient did well after the operation; the abscesses ceased to discharge, and the cavity in the stump filled with healthy granulations. By November 6th, he had regained a good appetite, the diarrhœa was entirely checked, and his general appearance and condition were rapidly improving." On the next day the patient was transferred to Newton University Hospital, Baltimore, where the following described operation was performed on February 2, 1864, by Surgeon C. W. Jones, U. S. V., in charge: "The end of the femur being necrosed, an incision six inches in length was made on the anterior aspect of the thigh and four inches of bone removed. Thirty-six hours afterwards hæmorrhage to the amount of four ounces occurred, when the sutures were removed and a large clot of blood was taken out, after which the bleeding ceased. After this the patient's constitutional condition continued to improve and the flaps approximated. By March 24th, the stump had entirely healed with a good cushion." The patient was discharged from service May 3, 1864, and pensioned. He was paid June 4, 1879. The sequestrum was contributed to the Museum by Acting Assistant Surgeon E. A. Koerper, and is represented in FIGURE 180, and an involucrum of new bone, removed at the last operation, is shown in FIGURE 181.

FIG. 180.—Tubular sequestrum removed from stump of the right femur. *Spec.* 1971.

FIG. 181.—Involucrum, 4 inches in length, from stump of right femur. *Spec.* 2153.

CASE 445.—Private J. Miller, Co. C, 18th Kentucky, aged 38 years, received a gunshot injury of the left lower extremity, at Richmond, August 30, 1862. Acting Assistant Surgeon J. B. Smith furnished the following history: "The wound was in the left knee and thigh, and amputation was performed on the field at the lower third of the femur. The patient was admitted to Washington Park Hospital October 15th. At the time of his admission he presented evidences of severe constitutional suffering, his skin being pale and yellow, accompanied by general emaciation, night sweats, and constant diarrhœa. The stump showed two or three small openings, and there was free discharge of sero-purulent fluid. Exposed bone could be distinctly felt with the probe. Astringent medicine was given until the fæcal discharges became natural. Warm-water dressings were used to the stump and the flaps supported with adhesive plaster, the wound being syringed every morning with a weak solution of chloride of soda. By December 1st, the patient was doing well, having good appetite and gaining flesh and strength rapidly, and all the constitutional trouble being removed. The end of the bone gradually became more exposed. On January 13, 1863, the patient being considered in a suitable condition for an operation, and having been placed under the influence of chloroform,

Acting Assistant Surgeon O. D. Norton cut down to the bone about four inches above its exposed end, dividing all the tissues, and carrying the knife downward to the opening at the end of the stump. The bone, after being dissected from the tissues, was then separated by a saw about three inches above the projecting extremity, the forceps being used for the removal of the spongy bone above the point of the division. Some trouble was experienced from hæmorrhage, necessitating the ligating of two or three small vessels. Water dressings were applied. By February 10th, the wound had healed and the patient was apparently doing well. On February 20th, he had a chill, followed by fever and by pain about the stump, when a small incision was made and about half an ounce of healthy pus discharged. From this time there was a gradually lessening quantity of pus until April 20th, when the wound had healed, and the patient, to all appearances, was well, being able to walk about the ward, and all his constitutional symptoms having disappeared." The patient was discharged April 30, 1864, and pensioned. He was paid March 4, 1879. The tubular sequestrum, three inches long and surrounded by a cylindrical involucrum of spongy bone, was contributed by Dr. Smith, and constitutes *Spec.* 1094 of the Surgical Section, A. M. M. It is represented in FIG. 2 of PLATE LXX, opposite.

In the following two instances of amputation in the lower third of the thigh, the officers continued in active service until the close of the war:

CASE 446.—Major-General D. E. Sickles, U. S. V., while in command of the Third Corps, at Gettysburg, was wounded, on the evening of July 2, 1863, by a twelve-pounder solid shot, which shattered his right leg. He dismounted unassisted, and aid arriving promptly, he was removed to a sheltered ravine a short distance to the rear, where the limb was amputated low down in the thigh by Surgeon T. Sim, U. S. V., Medical Director of the Corps. The patient was then sent farther to the rear, and, on the following day, he was transferred to Washington. The stump healed with great rapidity. Two weeks after the injury the patient was able to ride about in a carriage, and early in September he was well enough to again mount a horse, the stump being completely cicatrized. The bones of the amputated leg (*Spec.* 1335) were contributed to the Museum by the patient, and the history of the case was obtained from the operator. General Sickles subsequently for several years held command in South Carolina and the Department of the South, but has been retired from active service since April 14, 1869.[1]

CASE 447.—Major-General *R. S. Ewell*, while commanding a division of General Jackson's Corps of the Confederate Army, was wounded in the left knee during the night of the engagement at Manassas, August 28, 1862. Dr. Hunter McGuire, Surgeon and Medical Director of the Corps, who amputated the wounded limb, published an account of the case as follows:[2] "He was kneeling on the ground and looking under some pine bushes to get a better view of the field, when he was hit upon the left patella, nearly in the centre of it, and his leg being flexed, the ball passed downward, striking the head of the tibia and splitting it into several fragments. The bullet finally lodged in the muscles of the calf of the leg. He sent for me at once, but the messenger failed to find me, and I did not know he was hurt until General Jackson sent his aid-de-camp to tell me. He was still laboring under the severe shock of the injury when I found him, although several hours had elapsed. In all gunshot wounds of the knee the shock of injury is severe, but it was especially great in this instance. The General's health, naturally not very good, was unusually bad at this time. He had also lost a great deal of sleep, and the night he was hurt was compelled to drink a large quantity of strong tea to keep awake. * * He was so much exhausted when he was shot that his surgeons thought at one time he would die from the shock of the injury. When he had sufficiently recovered from this, I advised him to submit to amputation; but he consented to it very reluctantly, partly because some surgeon had assured him that his wound was not dangerous, but one from which he would soon recover. I amputated the thigh just above the knee, performing the operation as rapidly and with as little loss of blood as I could. About ten days after the amputation, to escape capture, he was carried on a litter by some soldiers near fifty miles. The motion on the litter caused the bone to protrude, and in consequence of this and his bad health the wound sloughed. After much suffering and the loss of an inch of bone, he got well enough to go about, when one day he was so unlucky as to let his crutches slip from under him, and falling upon an icy pavement, he re-opened the wound and knocked off another piece of bone. After some months he was well enough to go back to the field again, where he performed some very active service, but from the shape of his stump, and an ill-contrived wooden leg he wore, he was frequently troubled with abrasions of the skin, small abscesses, and so on. He now (1866) uses a suitable artificial limb, and with the assistance of a cane gets along right well, being no longer liable to affections of the stump."

As already stated, amputation in the lower thirds of both thighs was twice successfully performed. One of the survivors died in 1877, over thirteen years after the operation

CASE 448.—Corporal M. Dunn, Co. H, 46th Pennsylvania, aged 21 years, was wounded at Dallas, May 25, 1864. Surgeon W. C. Bennett, U. S. V., recorded his admission to the field hospital of the 1st division, Twentieth Corps, and noted: "Canister-shot fracture of both legs, followed by excision of the head of the left fibula and amputation of the right thigh. Vessels of left leg destroyed and mortification ensuing, necessitating amputation of left thigh." Three weeks after being wounded the patient was removed to hospital at Chattanooga, where the stumps assumed a gangrenous appearance, which yielded to the application of bromine. One month later the patient was transferred to hospital No. 14, at Nashville, whence he was furloughed and proceeded to his home. He subsequently entered the Post Hospital at Elmira, and lastly, on April 24, 1865, he was admitted to Central Park Hospital, New York City. Surgeon J. J. Milhau, U. S. A., in charge of the latter, reported the following history: "The missile passed through both legs just below the knee joints. The right thigh was amputated by the flap method, just above the knee joint, eighteen hours after the injury, and circular amputation of the left thigh was performed forty hours after the reception of the wound. In August, 1864, the right thigh had to be re-amputated at the middle third, which operation was performed by the circular method, at the patient's home, by Dr. Robison, of Wellsville, New York. The stump of the right thigh closed completely about December 1, 1864, but that of the left never entirely healed, and was still discharging from three

openings at the time of the patient's admission. On April 30th, chloroform was administered, and several pieces of necrosed bone were removed with the forceps by Acting Assistant Surgeon S. Teats, who made an incision some three inches in length on the face of the stump. The sequestrum being enclosed by a very thick involucrum, it was found necessary to remove a portion of the end of this with the gnawing forceps before the sequestrum could be extracted." The patient was discharged from service August 17, 1865, and pensioned, having been previously supplied with artificial limbs by the firm of A. A. Marks, of New York. The removed necrosed fragments were contributed to the Museum by the operator, and constitute Specimen 3193 of the Surgical Section. The pensioner died October 23, 1877. The cause of his death is alleged to have been the diseased condition of the stump of the left thigh.

In the second successful case of primary amputation of both thighs in the lower thirds the patient was a Confederate soldier:

CASE 449.—Private *C. G. Rush*, Co. C, 21st Georgia, aged 22 years, was wounded and captured during the assault on Fort Steadman, March 25, 1865. He was conveyed to the Ninth Corps field hospital, whence Assistant Surgeon S. Adams, U. S. A., contributed the pathological specimen (*Cat. Surg. Sect.*, 1866, p. 321, *Spec.* 3998), with the following history: "The injury consisted of a shell wound of the right leg below the knee joint, tearing open the joint, passing across and smashing the patella of the left leg. Surgeon L. W. Bliss, 51st New York, amputated both thighs at the lower third on the day of the injury. By April 1st the patient's general condition was excellent, his appetite and pulse good, and his tongue clean." The specimen consists of the amputated lower extremity of the left femur, with fragments of the patella. From the field hospital the patient was sent to City Point, and thence to Washington, where he was admitted to Armory Square, and subsequently to Lincoln Hospital. Surgeon J. C. McKee, U. S. A., in charge of the latter, contributed the photographs, represented in the annexed wood-cuts (FIGS. 182, 183), and described the amputation as a flap operation. The patient was released and discharged from hospital Aug. 2, 1865. Subsequently he entered and was treated for a time at St. Luke's Hospital, New York City, where, on February 28, 1866, he was provided by Dr. E. D. Hudson with artificial limbs, by means of which he was enabled to walk, requiring the assistance of two canes only.

FIG. 182.—Amputation of both thighs at lower thirds. [From a photograph.]

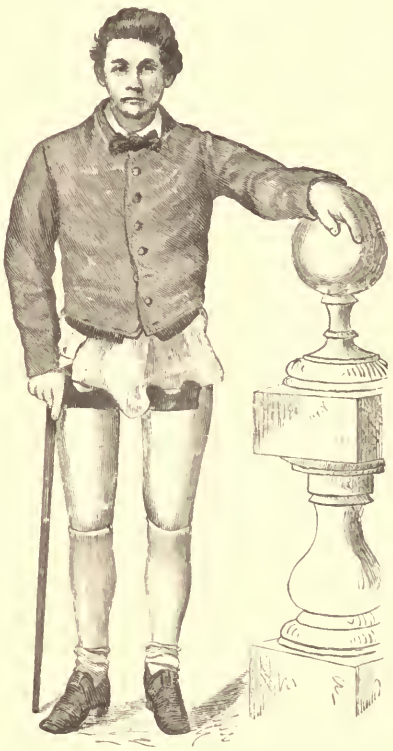

FIG. 183.—Artificial limbs applied in case of double amputation. [From a photograph.]

Twenty-seven of the seven hundred and forty-two Union soldiers who survived amputation in the middle third of the femur have died during the fourteen years since the close of the war. One case (CASE of Dunn) has already been detailed; in the following instance the patient survived the operation over fourteen years and died of phthisis:

FIG. 184.—Upper parts of bones of left leg; tuberosity of tibia split off obliquely.—*Spec.* 2344.

CASE 450.—Private C. Briot, Co. C, 39th New York, aged 26 years, was wounded in the left knee, at Bristoe Station, October 14, 1863. He was conveyed to Alexandria on the following day, and admitted to the First Division Hospital, whence Acting Assistant Surgeon C. W. Koechling transmitted the pathological specimen (FIG. 185), with the following history: "The wound was caused by a minié ball entering the external aspect of the knee, passing through the joint, and lodging. The missile was extracted from the internal aspect of the leg, on the field, by the regimental surgeon, and the limb was amputated at the lower third of the thigh, by the circular method, on October 16th, by Acting Assistant Surgeon N. Barnes. The patient came under my care on October 26th, at which time the bone protruded from the stump over an inch. For this gentle attraction of the integuments was made by adhesive strips and kept up for a week, when, the patient suffering too much pain, it was continued no longer, and a roller was applied from above downward and kept on until the bone was nearly covered. The patient improved every day, there being but very little discharge, but occasionally very severe pain in the stump. On February 8, 1864, the accompanying sequestrum was removed. On February 20th, the patient was seized with tetanic pains, which, though relieved by the free administration of opium, recurred every other day for a month. After that period the patient did well, and was able to take exercise on crutches, the stump having healed. On May 9th, the patient left the hospital on furlough." He subsequently passed through different hospitals, and lastly

FIG. 185.—Sequestrum from stump of left femur. *Spec.* 3027.

entered De Camp, David's Island, New York Harbor. On September 19, 1865, the man was discharged from service and pensioned. The upper portion of the bones of the leg of the amputated limb were forwarded to the Museum by the operator, and are represented in FIGURE 184, and a cast of the stump was contributed by Acting Assistant Surgeon G. F. Shrady. (*Cat. Surg. Sect.*, 1866, p. 548, *Spec.* 1787.) The New York City Examining Board certified, March 11, 1874: "The pensioner is unable to wear an artificial limb in consequence of excessive tenderness of the stump, rendering him unable to stand the pressure upon it. He has tried one several times, but it was so painful that he could not wear it more than a few hours." This pensioner died November 12, 1877, of phthisis pulmonalis.

Fatal Cases of Primary Amputation in the Lower Third of Femur.—Six of the nine hundred and twenty-seven cases of this group were instances of double amputations; the operations were, therefore, performed on nine hundred and twenty-one patients. Seven hundred and ninety were Union, and one hundred and thirty-one were Confederate soldiers. In the following case both thighs[1] were amputated in the lower third on the day of the injury, the patient surviving the operations eighteen days:

CASE 451.—Private D. Nicholson, Co. H, 22d Massachusetts, aged 23 years, was wounded in both thighs, at Spottsylvania, May 10, 1864. He was admitted to the field hospital of the 1st division, Fifth Corps, where Surgeon J. Thomas, 118th Pennsylvania, amputated both limbs. Surgeon R. B. Bontecou, U. S. V., reported the following termination of the case: "The patient entered Harewood Hospital, Washington, May 25th. He had undergone amputation of both thighs at the lower third the same day he received the wound, the operations being performed by the antero-posterior flap method. When admitted he was in a very weak condition, the stumps being unhealthy and showing a tendency to slough. A supporting treatment was administered. Progress, however, continued unfavorable. Death occurred from exhaustion May 28, 1864." The amputated portions of the femurs were contributed to the Museum by the operator, and constitute Specimen 2966 of the Surgical Section (FIGS. 186, 187), showing the right femur to be transversely perforated, with comminution, two inches above the condyle, by a bullet which passed on, badly grooving the left femur on the anterior face at the same level and producing a severe oblique fracture.

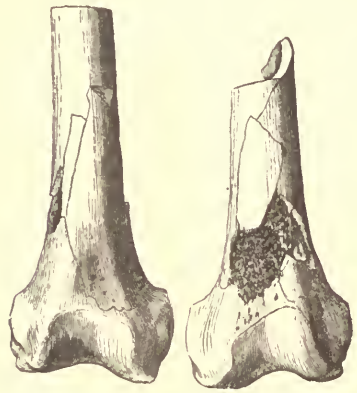

FIG. 186.—Anterior view of lower third of each femur. *Spec.* 2966.

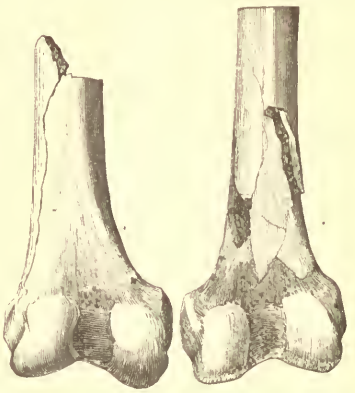

FIG. 187.—Posterior view of lower third of each femur. *Spec.* 2966.

CASE 452.—Private J. O. Blackburn, Co. E, 138th Pennsylvania, aged 35 years, was wounded at Monocacy Junction, July 9, 1864, and admitted to hospital at Frederick on the following day. Assistant Surgeon R. F. Weir, U. S. A., reported the following history: "The injury was caused by a fragment of a shell, which struck the inner side of the left knee, lacerated the soft parts, and comminuted the joint. On the day after his admission the patient was etherized, and the thigh was removed at the lower third, by Acting Assistant Surgeon W. S. Adams. The integuments in this case being in bad condition on the inner side, a circular incision was made to extend half around the limb, a long lateral flap on the outer side and a circular incision through the muscles, and the parts united by sutures and adhesive straps. The patient's condition at the time of the operation was very poor. July 13th, patient irritable; pulse 120; appetite rather poor; no effort at union by first intention. 16th, some evidence of sloughing of the flap. Ordered yeast poultices, also tartrate of potassa and iron in doses of twenty grains three times a day, and continued the stimulants and generous diet. 20th, line of demarcation well marked. 22d, slough being detached at several points; clipped it off with scissors down to the bleeding surface and thoroughly applied oakum saturated with a strong solution of permanganate of potassa, covering the whole with oiled silk. 25th, slough came away nicely, leaving a clean healthy surface. August 1st, patient doing tolerably well; granulations somewhat abundant but pale and flabby. Has obstinate diarrhœa, and is taking opiates and astringents in addition to other treatment. 10th, diarrhœa partially checked; appetite very poor; sloughing has recommenced, and permanganate of potassa is reapplied. 15th, sloughing about ceased. There is but little discharge, and the end of the stump is dry and refuses to granulate. Applied yeast poultice and continued the other treatment. 21st, patient quite despondent and evidently failing rapidly; pulse 140 and scarcely perceptible. Increased the stimulants. 28th, sloughing still continues and patient sinking. 31st, had a hæmorrhage from femoral artery to amount of eight ounces; controlled by tourniquet. Hæmorrhage occurred again on the following morning and was arrested by the tourniquet, the patient not being in condition to undergo ligation. He died at 7 o'clock P. M., on September 1, 1864. At the autopsy, eight hours after death, the body was found to be much emaciated and the muscles remarkably loose and flabby. On examining the stump to the head of the bone and removing the femoral artery and vein, the end of the artery was found to be pervious from the breaking down of the clot, and the vein much thickened and indurated." The amputated extremity of the femur, showing the inner condyle to be superficially fractured (*Spec.* 3832), and four and a half inches of the stump of the bone, being superficially necrosed (*Spec.* 3488), together with the femoral artery (*Spec.* 3980), were contributed to the Army Med. Museum by the operator.

[1] The remaining five fatal cases of amputation of both thighs in the lower third of the femur are: Pt. S. Allen, G, 59th Mass. (No. 984, TABLE XXXII, p. 257); Pt. R. S. Michael, A, 105th Penn. (No. 1551, TABLE XXXII, p. 263); Serg't E. C. Rabbit, B, 10th Missouri (No. 1652, TABLE XXXII, p. 264); Pt. J. Stewart, D, 77th New York (No. 1769, TABLE XXXII, p. 265); and Lieut. J. Whelpley, D, 1st Maine (No. 1862, TABLE XXXII, p. 267).

TABLE XXXII.

Summary of Nineteen Hundred and Fourteen Cases of Primary Amputations in the Lower Third of the Femur for Shot Fracture.

Recoveries, 1—973; Deaths, 974—1900; Result unknown, 1901—1914.

No.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	OPERATIONS, OPERATORS, RESULT.
1	Abbott, O. A., Serg't, A, 14th Conn., age 24.	Oct. 27, 28, '64.	Left; circ. Surg. F. A. Dudley, 14th Conn. Disch'd June 9, '65.
2	Adair, R., Serg't, F, 7th Infantry.	Feb. 21, 22, '62.	Right; circ. A. Surg. B. Norris, U. S. A. Disch'd July 13, '62; subsequent operation.
3	Adams, E. H., Pt., C, 12th Iowa.	June 8, 8, '63.	Left; flap. Surg. A. H. Hoff, U. S. V. Disch'd Sept. 22, '63.
4	Aderhold, E., Pt., E, 6th Penn. Reserves.	Oct. 14, 14, '63	Left. Disch'd May 2, '64. Died Jan. 22, 1869.
5	Agren, A., Pt., C, 7th Minnesota.	Mar. 27, 27, '65.	Right; circ. Surg. A. T. Bartlett, 33d Mo. Disch'd June 14, 1865.
6	*Aldensen, J. J.*, Serg't, K, 46th Miss., age 32.	Nov. 30, Dec. 1, '64.	Right; anterior post. flap. Surg. McCormack, C. S. A. Provost Marshal March 7, 1865.
7	Aldrich, B., Pt., A, 155th New York.	July 9, 11, '64.	Left; ant. post. flap. A. A. Surg. W. S. Adams. Disch'd. *Spec.* 3938.
8	*Alexander, G.*, Pt., A, 4th Virginia, age 39.	May 3, 4, '63.	Right; flap. Recovery with good stump.
9	Allen, J., Corp'l, I, 22d Illinois, age 23.	Sept 19, 21, '63.	Right; flap. Surg. T. L. Magee, 51st Ill. Disch'd Feb. 27, 1864.
10	Allen, J. G., Pt., A, 77th New York, age 39.	June 21, 21, '64.	Left; ant. post. flap. Surg. G. T. Stevens, 77th N. Y. Disch'd Sept. 9, 1864.
11	Allen, R., Serg't, A, 59th Illinois, age 34.	Dec. 15, 15, '64.	Right; circ. Disch'd July 1, '65.
12	Ammerman, G., Corp'l, C, 6th Penn. Reserves, age 26.	May 6, 6, '64.	Left; ant. post. flap. Surg. C. Bowers, 6th Penn. Res. Disch'd May 30, 1865.
13	Anderson, J., Pt., I, 21st Ohio.	Jan. 2, 2, '63.	Left; flap. Disch'd March 13, 1863.
14	Anderson, J., Pt., I, 21st Kentucky.	June 22, 22, '64.	Left; flap. Surg. C. J. Walton, 21st Ky. Must. out Jan. 23, '65.
15	Andrews, A. C., Pt., H, 32d Mass., age 21.	Feb. 6, 6, '65.	Right; flap. June 10, reamp. two and a half ins. A. A. Surg. E. B. Lyon. Disch'd Oct. 20, '65.
16	Angle, H., Pt., F, 5th Wisconsin, age 31.	May 5, 5, '64.	Left; circ. Disch'd May 30, '64.
17	*Anthony, A.*, Lieut., E, 33d N. C., age 21.	Mar. 25, 25, '65.	Left; circ. A. Surg. E. P. Roche, 35th Mass. Released July 10, '65.
18	Anthony, H. G., Pt., C, 6th Vermont, age 24.	Sept. 19, 19, '64.	Left; circ. Surg. E. Phillips, 6th Vt. Disch'd June 26, 1865.
19	*Anthony, R. H.*, Pt., D, 1st Tennessee.	July 1, 2, '63.	Left. Surg. — McGuire, C. S. A. Exch'd March 17, 1864.
20	Armsberg, G., Pt., L, 62d Penn., age 18.	July 3, 3, '63.	Left. Dec. 21, exfol. removed. Disch'd Oct. 19, '64. *Spec.* 2156.
21	Armstrong, A. T., Pt., H, 31st Maine, age 24.	May 12, 14, '64.	Right; double lat. flap. Surg. J. S. Ross, 11th N. H. Disch'd Nov. 16, 1864.
22	*Ash, J.*, Pt., G, 25th S. Carolina, age 30.	May 16, 16, '64.	Left; circ. Furloughed July —, 1864.
23	Ashby, D. C., Lieut., H, 80th Indiana, age 24.	Dec. 15, 17, '64.	Right. Vermale's method. Asst. Surg. W. B. Trull, U. S. V. Mustered out May 15, 1865.
24	Ashburn, J. C., Corp'l, B, 14th W. Va., age 25.	Oct. 19, 20, '64.	Left; circ. Disch'd June 5, '65.
25	Atkins, C. S., Serg't, D, 6th Kans. Cav., age 22.	July 27, 27, '64.	Right; flap. Surg. C. E. Swasey, U. S. V. Aug. 2, hæm.; artery sec'd.. M. out. 1870, bad stump.
26	Atwell, W. P., Lieut., G, 37th Wis., age 19.	July 30, 30, '64.	Right. Disch'd Nov. 25, 1865 1871, not in good condition.
27	Auker, H., Serg't, C, 28th Penn., age 24.	May 25, 25, '64.	Left. Surg. H. E. Goodman, U. S. V. Mustered out July, 1865.
28	Ayres, D. C., Pt., I, 102d Penn., age 26.	May 5, 5, '64.	Left; circ. Disch'd Mar. 13, '65.
29	Bacon, G. F., Pt., A, 20th Maine, age 18.	Mar. 31, 31, '65.	Left; flap. Disch'd July 25, '65.
30	Bailey, W. F., Pt., A, 2d U. S. Sharpshooters.	Aug. 29, 30, '62.	Right; circular. Discharged.
31	Bakeoven, G. A., Pt., F, 72d Pennsylvania.	Nov. 27, 28, '63.	Left; flap. Surg. M. Rizer, 72d Penn. Mustered out Aug. 24, 1864. *Spec.* 1883.
32	*Baker, H. C.*, Pt., F, 48th North Carolina.	June 27, 27, '62.	Right. Surg. Gibbon, C. S. A. Retired.
33	Baker, J. D., Pt., H, 4th Iowa, age 28.	Nov. 24, 24, '63.	Left; circ. Surg. M. W. Robbins, 4th Iowa. Disch'd July 27, 1864.
34	Baker, J. W., Lieut., A, 14th Indiana.	Dec. 13, 13, '62.	Left. Disch'd February 1, 1863.
35	Baker, S., Pt., K, 16th N. Y. H. A., age 18.	Oct. 7, 7, '64.	Right; flap. Oct. 12, bone cut shorter. Disch'd Oct. 3, 1865. *Spec.* 2382.
36	Baldwin, C., Corp'l, H, 58th Penn., age 32.	June 1, 1, '64.	Left; ant. post. flap. Surg. H. C. Christy, 58th Pa. Disch'd Feb. 4, 1865.
37	*Baldwin, P. B.*, Serg't, D, 48th Alabama.	June 17, 17, '64.	——. Surg. — Cook, 47th Alabama. Recovered.
38	*Ballentine, H. J.*, Lieut., B, 42d Tenn., age 29.	Nov. 29, Dec. 1, '64.	Left; circ. Prov. Marshal June 5, 1865.
39	Bangs, L. G., Adj't. 19th Illinois, age 27.	Nov. 24, 24, '63.	Right; circ. Surg. F. H. Gross, U. S. V. Erysipelas. Mustered out July 9, 1864.
40	Bappert, M., Pt., G, 47th Ohio, age 18.	Aug. 3, 3, '64.	Left; flap. Surg. S. P. Bonner. 47th Ohio. Aug. 18, oper. May 30, '65, nec. bone rem'd. Disch'd Aug. 9, 1865.
41	*Barclay, T.*, Pt., K, 14th Louisiana.	Nov. 27, 28, '63.	——. Surg. — White. Recovery.
42	*Barker, H.*, Pt., H, 31st Virginia.	Oct. 19, 20, '64.	——; circular. Dr. G. L. Miller. Transferred.
43	Barnes, J. E., Serg't, A, 77th New York, age 37.	June 21, 21, '64.	Left; ant. post. flap. Surg. G. T. Stevens, 77th N. Y. Disch'd Oct. 26, 1864.
44	[1] *Barrett, M.*, Corp'l, E, 19th Alabama.	Sept. 19, 19, '63.	——. Amputation. Transferred to hospital Oct. 3. 1863.
45	Bartle, W., Serg't, H, 86th New York, age 25.	Nov. 17, 17, '64.	Left; circ. Surg. O. I. Owens, 40th N. Y. Disch'd June 6, '65. *Spec.* 4129.
46	Bastian, J., Pt., A, 31st Illinois.	June 27, 27, '64.	Right; circ. Surg. J. Reeves, 78th Ohio. M. out May 31, '65.
47	Bauer, J., Pt., F, 100th New York.	July 22, 22, '63.	Left; ant. flap. Surg. M. S. Kittinger. 100th N. York. Disch'd May 3, 1864.
48	Baughman, C., Pt., B, 1st Mich. Art., age 26.	Nov. 22, 22, '64.	Right; ant. post. flap. Surg. A. T. Hudson, 26th Iowa. Disch'd June 3, 1865.
49	Beall, T., Pt., C, 39th Iowa, age 28.	Oct. 5, 7, '64.	Left. Surg. J. R. Zearing, 57th Illinois. Disch'd July 8, 1865.
50	Bean, C. H., Pt., E, 11th Maine, age 19.	July 21, 21, '64.	Left; flap. Surg. N. F. Blunt, 11th Me. Disch'd June 10, '65.
51	Beightal, J., Pt., C, 93d Penn., age 39.	Mar. 25, 25, '65.	Right; flap; erysipelas. Disch'd July 12, 1865.
52	Beisse, N., Bugler, A, 1st Michigan Battery.	Oct. 8, 10, '62.	Left; circ. Surg. C. S. Muscroft, 10th Ohio. Disch'd June 7, '63.
53	Bell, G. W., Pt., H, 39th Ohio, age 26.	July 22, 22, '64.	Right; flap. Surg. J. R. Zearing, 57th Ill. Disch'd June 17, '65.
54	*Bell, J. H.*, Pt., E, 15th Alabama.	Aug. 16, 16, '64.	Left; circ. Surg. — ———, 15th Ala. Diarr. Trans. Aug. 31, '64.
55	Bellew, B., Pt., I, 4th Delaware, age 45.	July 25, 25, '64.	Right; circ. Surg. D. A. Chamberlain, 94th N. York. Disch'd July 13, 1865.
56	Bergeoin, P. P., Serg't, H, 3d Mich., age 21.	Aug. 29, 29, '62.	Right; flap; abscesses. V. R. C. June, 1863.
57	*Berry, W. T.*, Pt., Purcell's Battery.	July 1, 1, '62.	Left. Recovery.
58	Beaverson, D., Pt., H, 187th Penn., age 23.	July 10, 10, '64.	Left; circ. Disch'd July 11, '65.
59	*Bickel, J. P.*, Corp'l, G, 20th Virginia Cavalry.	Sept. 20, 20, '64.	——. Surg. — Sawers, C. S. A. Recovery.
60	Billington, S. A., Pt., C, 11th Maine, age 26.	Oct. 27, 27, '64.	Left; flap. Surg. N. Y. Leit, 76th Penn. Disch'd June 12, 1865.
61	*Billingsley, J. B.*, Pt., I, 43d Alabama, age 21.	May 16, 16, '64.	——; circ. Surg. Hilliard, C.S.A. Recovery.
62	Bish, A., Pt., G, 155th Penn., age 25.	Oct. 27, 28, '64.	Left; circ. Union by first intention. Disch'd March 17, 1865.
63	Bishop, J. H., Serg't, F, 18th Kentucky.	Aug. 30, 30, '62.	Left; flap. A. Surg. J. D. Gatch, 16th Indiana. Discharged.
64	Bishop, H., Pt., A, 88th Penn., age 20.	Dec. 13, 13, '62.	Left; flap; gang. May 1, seq. rem. Disch'd Dec. 17, '63. *Spec.* 1264.
65	Black, W. R., Serg't, G, 67th Penn., age 22.	April 6, 7, '65.	Right; ant. post. flap. A. Surg. T. F. Corson, 67th Penn. Discharged July 7, 1865.
66	Blanchard, C. H., Pt., F, 34th Mass., age 23.	Oct. 19, 19, '64.	Right; circ. Confed. Surgeon. Disch'd Jan. 9, 1865.
67	Blanchard, W., Pt., B, 90th N. York, age 22.	Oct. 19, 19, '64.	Left; flap. Disch'd July 4, 1865.
68	*Blackburn, L. G.*, Pt., D, 3d Missouri.	Oct. 4, 4, '62.	Recovery.
69	Bliven, C. J., Pt., K, 4th Rhode Island, age 21.	July 30, 30, '64.	Left; circ. A. Surg. R. Millar, 4th R. I. Sub. operat's. Disch'd Jan. 23, 1865.
70	Blossom, W. E., Pt., G, 184th N. York, age 34.	Dec. 5, 6, '64.	Left; bilat. oval flap. Surg. N. R. Barnes, 184th N. Y. Disch'd June 15, 1865.
71	Boardman, T., Pt., A, 22d Massachusetts.	June 27, 28, '62.	Right. Surg. E. Bentley, U. S. V. Two sub. op. Dis'd May 2, '64.
72	*Bolton, G. W.*, Pt., D, 44th Ala., age 39.	Sept. 20, —, '63.	Left. To Provost Marshal March 16, 1864.
73	Boland, J. C., Lieut., E, 60th New York, age 32.	May 9, 9, '64.	Left; ant. post. flap. Surg. W. B. Fox, 8th Mich. Disch'd Nov. 27, 1864.
74	Bonnell, W. D., Pt., G, 152d N. York, age 23.	Aug. 14, 14, '64.	Left; flap. Confed. Surg. Nec. Disch'd May 9, 1865.
